1 It is generally agreed that when, in mythologies, one generation of gods is overcome by another, what is denoted is the historical replacement of one religious system with a new one, whether as a result of foreign conquest or of psychological development. In the latter case myth approximates to what Silberer [1909] has described as 'functional phenomena'. [Cf. Freud, 1900*a*; *RSE*, **5**, 450 ff.] The view maintained by Jung (1911–12) that the god who kills the animal is a libidinal symbol implies a concept of libido other than that which has hitherto been employed and seems to me questionable from every point of view.

The ceremonials of human sacrifice, performed in the most different parts of the inhabited globe, leave very little doubt that the victims met their end as representatives of the deity; and these sacrificial rites can be traced into late times, with an inanimate effigy or puppet taking the place of the living human being. The theanthropic sacrifice of the god, into which it is unfortunately impossible for me to enter here as fully as into animal sacrifice, throws a searching retrospective light upon the meaning of the older forms of sacrifice. [Smith, 1894, 410 f.] It confesses, with a frankness that could hardly be excelled, to the fact that the object of the act of sacrifice has always been the same – namely what is now worshipped as God, that is to say, the father. The problem of the relation between animal and human sacrifice thus admits of a simple solution. The original animal sacrifice was already a substitute for a human sacrifice – for the ceremonial killing of the father; so that, when the father surrogate once more resumed its human shape, the animal sacrifice too could be changed back into a human sacrifice.

The memory of the first great act of sacrifice thus proved indestructible, in spite of every effort to forget it; and at the very point at which men sought to be at the farthest distance from the motives that led to it, its undistorted reproduction emerged in the form of the sacrifice of [152]
the god. I need not enlarge here upon the developments of religious thought which, in the shape of rationalizations, made this recurrence possible. Robertson Smith, who had no thought of our derivation of sacrifice from the great event in human prehistory, states that the ceremonies at the festivals in which the ancient Semites celebrated the death of a deity 'were currently interpreted as the commemoration of a mythical tragedy' [ibid., 413]. 'The mourning', he declares, 'is not a spontaneous expression of sympathy with the divine tragedy, but obligatory and enforced by fear of supernatural anger. And a chief object of the mourners is to *disclaim responsibility for the god's death* – a point which has already come before us in connection with theanthropic sacrifices, such as the "ox-murder at Athens".' (Ibid., 412.) It seems most probable that these 'current interpretations' were correct and that the feelings of the celebrants were fully explained by the underlying situation.

Let us assume it to be a fact, then, that in the course of the later development of religions the two driving factors, the son's sense of guilt and the son's rebelliousness, never became extinct. Whatever attempt was made at solving the religious problem, whatever kind of reconciliation was effected between these two opposing mental forces, sooner or later

broke down, under the combined influence, no doubt, of historical events, cultural changes and internal psychical modifications.

The son's efforts to put himself in the place of the father god became ever more obvious. The introduction of agriculture increased the son's importance in the patriarchal family. He ventured upon new demonstrations of his incestuous libido, which found symbolic satisfaction in his cultivation of Mother Earth. Divine figures such as Attis, Adonis and Tammuz emerged, spirits of vegetation and at the same time youthful divinities enjoying the favours of mother goddesses and committing incest with their mother in defiance of their father. But the sense of guilt, which was not allayed by these creations, found expression in myths which granted only short lives to these youthful favourites of the mother goddesses and decreed their punishment by emasculation or by the wrath of the father in the form of an animal. Adonis was killed by
[153] a wild boar, the sacred animal of Aphrodite; Attis, beloved of Cybele, perished by castration.[1] The mourning for these gods and the rejoicings over their resurrection passed over into the ritual of another son deity who was destined to lasting success.

When Christianity first penetrated into the ancient world it met with competition from the religion of Mithras and for a time it was doubtful which of the two deities would gain the victory. In spite of the halo of light surrounding his form, the youthful Persian god remains obscure to us. We may perhaps infer from the sculptures of Mithras slaying a bull that he represented a son who was alone in sacrificing his father and thus redeemed his brothers from their burden of complicity in the deed. There was an alternative method of allaying their guilt and this was first adopted by Christ. He sacrificed His own life and so redeemed the company of brothers from original sin.

The doctrine of original sin was of Orphic origin. It formed a part of the mysteries, and spread from them to the schools of philosophy of ancient Greece. (Reinach, 1905–12, **2**, 75 ff.) Mankind, it was said, were

1 Fear of castration plays an extremely large part, in the case of the youthful neurotics whom we come across, as an interference in their relations with their father. The illuminating instance reported by Ferenczi (1913*a*) has shown us how a little boy took as his totem the beast that had pecked at his little penis. When our [Jewish] children come to hear of ritual circumcision, they equate it with castration. The parallel in social psychology to this reaction by children has not yet been worked out, so far as I am aware. In primaeval times and in primitive races, where circumcision is so frequent, it is performed at the age of initiation into manhood and it is at that age that its significance is to be found; it was only as a secondary development that it was shifted back to the early years of life. It is of very great interest to find that among primitive peoples circumcision is combined with cutting the hair and knocking out teeth or is replaced by them, and that our children, who cannot possibly have any knowledge of this, in fact treat these two operations, in the anxiety with which they react to them, as equivalents of castration.

descended from the Titans, who had killed the young Dionysus-Zagreus and had torn him to pieces. The burden of this crime weighed on them. A fragment of Anaximander relates how the unity of the world was broken by a primaeval sin,[1] and that whatever issued from it must bear the punishment. The tumultuous mobbing, the killing and the tearing in [154] pieces by the Titans reminds us clearly enough of the totemic sacrifice described by St Nilus [ibid., **2**, 93] – as, for the matter of that, do many other ancient myths, including, for instance, that of the death of Orpheus himself. Nevertheless, there is a disturbing difference in the fact of the murder having been committed on a *youthful* god.

There can be no doubt that in the Christian myth the original sin was one against God the Father. If, however, Christ redeemed mankind from the burden of original sin by the sacrifice of His own life, we are driven to conclude that the sin was a murder. The law of talion, which is so deeply rooted in human feelings, lays it down that a murder can only be expiated by the sacrifice of another life: self-sacrifice points back to blood guilt.[2] And if this sacrifice of a life brought about atonement with God the Father, the crime to be expiated can only have been the murder of the father.

In the Christian doctrine, therefore, men were acknowledging in the most undisguised manner the guilty primaeval deed, since they found the fullest atonement for it in the sacrifice of this one son. Atonement with the father was all the more complete since the sacrifice was accompanied by a total renunciation of the women on whose account the rebellion against the father was started. But at that point the inexorable psychological law of ambivalence stepped in. The very deed in which the son offered the greatest possible atonement to the father brought him at the same time to the attainment of his wishes *against* the father. He himself became God, beside, or, more correctly, in place of, the father. A son religion displaced the father religion. As a sign of this substitution the ancient totem meal was revived in the form of communion, in which the company of brothers consumed the flesh and blood of the son – no longer the father – obtained sanctity thereby and identified themselves with him. Thus we can trace through the ages the identity of the totem meal with animal sacrifice, with theanthropic human sacrifice and with the Christian Eucharist, and we can recognize in all these rituals the effect of the crime by which men were so deeply weighed down but of [155]

1 '*Une sorte de péché proethnique*' (Reinach, 1905–12, **2**, 76).

2 We find that impulses to suicide in a neurotic turn out regularly to be self-punishments for wishes for someone else's death.

which they must nonetheless feel so proud. The Christian communion, however, is essentially a fresh elimination of the father, a repetition of the guilty deed. We can see the full justice of Frazer's pronouncement that 'the Christian communion has absorbed within itself a sacrament which is doubtless far older than Christianity'.[1]

(7)

An event such as the elimination of the primal father by the company of his sons must inevitably have left ineradicable traces in the history of humanity; and the less it itself was recollected, the more numerous must have been the substitutes to which it gave rise.[2] I shall resist the temptation of pointing out these traces in mythology, where they are not hard to find, and shall turn in another direction and take up a suggestion made by Salomon Reinach in a most instructive essay on the death of Orpheus.[3]

In the history of Greek art we come upon a situation which shows striking resemblances to the scene of the totem meal as identified by Robertson Smith, and not less profound differences from it. I have in mind the situation of the most ancient Greek tragedy. A company of individuals, named and dressed alike, surrounded a single figure, all hanging upon his words and deeds: they were the Chorus and the impersonator of the Hero. He was originally the only actor. Later, a second and third actor were added, to play as counterpart to the Hero and as characters split off from him; but the character of the Hero himself and [156] his relation to the Chorus remained unaltered. The Hero of tragedy must suffer; to this day that remains the essence of a tragedy. He had to bear the burden of what was known as 'tragic guilt'; the basis of that guilt is not always easy to find, for in the light of our everyday life it is often no guilt at all. As a rule it lay in rebellion against some divine or human authority; and the Chorus accompanied the Hero with feelings of sympathy, sought to hold him back, to warn him and to sober him, and

1 Frazer (1912, **2**, 51). No-one familiar with the literature of the subject will imagine that the derivation of Christian communion from the totem meal is an idea originating from the author of the present essay.

2 In Ariel's words from *The Tempest*:

> Full fathom five thy father lies;
> Of his bones are coral made;
> Those are pearls that were his eyes:
> Nothing of him that doth fade,
> But doth suffer a sea-change
> Into something rich and strange.

3 'La mort d'Orphée', contained in the volume which I have so often quoted (1905–12, **2**, 100 ff.).

mourned over him when he had met with what was felt as the merited punishment for his rash undertaking.

But why had the Hero of tragedy to suffer? and what was the meaning of his 'tragic guilt'? I will cut the discussion short and give a quick reply. He had to suffer because he was the primal father, the Hero of the great primaeval[1] tragedy which was being re-enacted with a tendentious twist; and the tragic guilt was the guilt which he had to take on himself in order to relieve the Chorus from theirs. The scene upon the stage was derived from the historical scene through a process of systematic distortion – one might even say, as the product of a refined hypocrisy. In the remote reality it had actually been the members of the Chorus who caused the Hero's suffering; now, however, they exhausted themselves with sympathy and regret and it was the Hero himself who was responsible for his own sufferings. The crime which was thrown on to his shoulders, presumptuousness and rebelliousness against a great authority, was precisely the crime for which the members of the Chorus, the company of brothers, were responsible. Thus the tragic Hero became, though it might be against his will, the redeemer of the Chorus.

In Greek tragedy the special subject matter of the performance was the sufferings of the divine goat, Dionysus, and the lamentation of the goats who were his followers and who identified themselves with him. That being so, it is easy to understand how drama, which had become extinct, was kindled into fresh life in the Middle Ages around the Passion of Christ.

At the conclusion, then, of this exceedingly condensed inquiry, I should like to insist that its outcome shows that the beginnings of religion, morals, society and art converge in the Oedipus complex. This is in complete agreement with the psychoanalytic finding that the same [157] complex constitutes the nucleus of all neuroses, so far as our present knowledge goes. It seems to me a most surprising discovery that the problems of social psychology, too, should prove soluble on the basis of one single concrete point – man's relation to his father. It is even possible that yet another psychological problem belongs in this same connection. I have often had occasion to point out that emotional ambivalence in the proper sense of the term – that is, the simultaneous existence of love and hate towards the same object – lies at the root of many important cultural institutions. We know nothing of the origin of this ambivalence. One

1 [Grubrich-Simitis (1993, 221; trans., 173) points out that Freud's manuscript at this point originally read 'great mythological tragedy'.]

possible assumption is that it is a fundamental phenomenon of our emotional life. But it seems to me quite worth considering another possibility, namely that originally it formed no part of our emotional life but was acquired by the human race in connection with their father complex,[1] precisely where the psychoanalytic examination of modern individuals still finds it revealed at its strongest.[2]

Before I bring my remarks to a close, however, I must find room to point out that, though my arguments have led to a high degree of convergence upon a single comprehensive nexus of ideas, this fact cannot blind us to the uncertainties of my premises or the difficulties involved in my conclusions. I will mention only two of the latter which may have forced themselves on the notice of a number of my readers.

No-one can have failed to observe, in the first place, that I have taken as the basis of my whole position the existence of a collective mind [*Massenpsyche*][T], in which mental processes occur just as they do in the
Masse
[158] mind of an individual. In particular, I have supposed that the sense of guilt for an action has persisted for many thousands of years and has remained operative in generations which can have had no knowledge of that action. I have supposed that an emotional process, such as might have developed in generations of sons who were ill-treated by their father, has extended to new generations which were exempt from such treatment for the very reason that their father had been eliminated. It must be admitted that these are grave difficulties; and any explanation that could avoid presumptions of such a kind would seem to be preferable.

Further reflection, however, will show that I am not alone in the responsibility for this bold procedure. Without the assumption of a collective mind, a continuity in the emotional life of man,[3] which makes it possible to neglect the interruptions of mental acts caused by the extinction of the individual, social psychology in general cannot exist. Unless psychical processes were continued from one generation to another, if each generation were obliged to acquire its attitude to life

1 Or, more correctly [*Respektive*][t], their parental complex.

2 Since I am used to being misunderstood, I think it worthwhile to insist explicitly that the derivations which I have proposed in these pages do not in the least overlook the complexity of the phenomena under review. All that they claim is to have added a new factor to the sources, known or still unknown, of religion, morality and society – a factor based on a consideration of the implications of psychoanalysis. I must leave to others the task of synthesizing the explanation into a unity. It does, however, follow from the nature of the new contribution that it could not play any other than a central part in such a synthesis, even though powerful emotional resistances might have to be overcome before its great importance was recognized.

3 [This clause was accidentally omitted in the *SE* translation.]

anew, there would be no progress in this field and next to no development. This gives rise to two further questions: how much can we attribute to psychical continuity in the sequence of generations? and what are the ways and means employed by one generation in order to hand on its mental states to the next one? I shall not pretend that these problems are sufficiently explained or that direct communication and tradition – which are the first things that occur to one – are enough to account for the process. Social psychology shows very little interest, on the whole, in the manner in which the required continuity in the mental life of successive generations is established. A part of the problem seems to be met by the inheritance of psychical dispositions which, however, need to be given some sort of impetus in the life of the individual before they can be roused into actual operation. This may be the meaning of the poet's words:

> Was du ererbt von deinen Vätern hast,
> Erwirb es, um es zu besitzen.[1]

The problem would seem even more difficult if we had to admit that [159]
mental impulses could be so completely suppressed as to leave no trace whatever behind them. But that is not the case. Even the most ruthless suppression must leave room for distorted surrogate impulses and for reactions resulting from them. If so, however, we may safely assume that no generation is able to conceal any of its more important mental processes from its successor. For psychoanalysis has shown us that everyone possesses in his unconscious mental activity an apparatus which enables him to interpret other people's reactions, that is, to undo the distortions which other people have imposed on the expression of their feelings. An unconscious understanding such as this of all the customs, ceremonies and dogmas left behind by the original relation to the father may have made it possible for later generations to take over their heritage of emotion.

Another difficulty might actually be brought forward from psychoanalytic quarters. The earliest moral precepts and restrictions in primitive society have been explained by us as reactions to a deed which gave those who performed it the concept of 'crime'. They felt remorse for the deed and decided that it should never be repeated and that its performance should bring no advantage. This creative sense of guilt still persists among us. We find it operating in an asocial manner in neurotics, and

1 [Goethe, *Faust*, Part I, Scene 1: 'What thou hast inherited from thy fathers, acquire it to make it thine.' Freud quoted this again in his *Outline of Psychoanalysis* (1940*a* [1938]), *RSE*, **23**, 186.]

producing new moral precepts and persistent restrictions, as an atonement for crimes that have been committed and as a precaution against the committing of new ones.[1] If, however, we enquire among these neurotics to discover what were the deeds which provoked these reactions, we shall be disappointed. We find no deeds, but only impulses and emotions, set upon evil ends but held back from their achievement. What lie behind the sense of guilt of neurotics are always *psychical* realities and never *factual* ones. What characterizes neurotics is that they prefer psychical to factual reality and react just as seriously to thoughts as normal people do to realities.

May not the same have been true of primitive men? We are justified in believing that, as one of the phenomena of their narcissistic organization, they overvalued their psychical acts to an extraordinary degree.[2] Accordingly the mere hostile *impulse* against the father, the mere existence of a [160] wishful *phantasy* of killing and devouring him, would have been enough to produce the moral reaction that created totemism and taboo. In this way we should avoid the necessity for deriving the origin of our cultural legacy, of which we justly feel so proud, from a hideous crime, revolting to all our feelings. No damage would thus be done to the causal chain stretching from the beginning to the present day, for psychical reality would be strong enough to bear the weight of these consequences. To this it may be objected that an alteration in the form of society from a patriarchal horde to a fraternal clan did actually take place. This is a powerful argument, but not a conclusive one. The alteration might have been effected in a less violent fashion and nonetheless have been capable of determining the appearance of the moral reaction. So long as the pressure exercised by the primal father could be felt, the hostile feelings towards him were justified, and remorse on their account would have to await a later day. And if it is further argued that everything derived from the ambivalent relation to the father – taboo and the sacrificial ordinance – is characterized by the deepest seriousness and the most complete reality, this further objection carries just as little weight. For the ceremonials and inhibitions of obsessional neurotics show these same characteristics and are nevertheless derived only from psychical reality – from intentions and not from their execution. We must avoid transplanting a contempt for what is merely thought or wished from our commonplace world, with its wealth of material values, into the world of primitive men and neurotics, of which the wealth lies only within themselves.

1 Cf. the essay on taboo, the second in this work [p. 69 ff. above].

2 Cf. the third essay in this work [p. 83].

Here we are faced with a decision which is indeed no easy one. First, however, it must be confessed that the distinction, which may seem fundamental to other people, does not in our judgement affect the heart of the matter. If wishes and impulses have the full value of facts for primitive men, it is our business to give their attitude our understanding attention instead of correcting it in accordance with our own standards. Let us, then, examine more closely the case of neurosis – comparison with which led us into our present uncertainty. It is not accurate to say that obsessional neurotics, weighed down under the burden of an excessive morality, are defending themselves only against *psychical* reality and [161]
are punishing themselves for impulses which were merely *felt*. *Historical* reality has a share in the matter as well.[1] In their childhood they had these evil impulses pure and simple, and turned them into acts so far as the impotence of childhood allowed. Each of these excessively virtuous individuals passed through an evil period in his infancy – a phase of perversion which was the forerunner and precondition of the later period of excessive morality. The analogy between primitive men and neurotics will therefore be far more fully established if we suppose that in the former instance, too, psychical reality – as to the form taken by which we are in no doubt – coincided at the beginning with factual reality: that primitive men actually *did* what all the evidence shows that they intended to do.

Nor must we let ourselves be influenced too far in our judgement of primitive men by the analogy of neurotics. There are distinctions, too, which must be borne in mind. It is no doubt true that the sharp contrast that *we* make between thinking and doing is absent in both of them. But neurotics are above all *inhibited* [*gehemmt*] in their actions: with them the thought is a complete substitute for the deed. Primitive men, on the other hand, are *uninhibited*: thought passes directly into action. With them it is rather the deed that is a substitute for the thought. And that is why, without laying claim to any finality of judgement, I think that in the case before us it may safely be assumed that 'in the beginning was the Deed'.[2]

1 [Freud's distinction between psychical and factual or material reality is discussed, with many references, in an Editors' footnote to Section 2 of Part III of the 'Project' of 1895 (*RSE*, **1**, 397 *n.* 1).]

2 ['*Im Anfang war die Tat*' (Goethe, *Faust*, Part I, Scene 3). – Freud's line of thought in this essay was taken up and carried further by him in his *Group Psychology* (1921*c*), Chapter X; *RSE*, **18**, 114 ff., later still in *The Future of an Illusion* (1927*c*), particularly in Chapter IV; ibid., **21**, 19 ff., and finally in his *Moses and Monotheism* (1939*a*), ibid., **23**, 9 ff.]

APPENDIX A

OPENING PASSAGES OF 'SOME POINTS OF AGREEMENT BETWEEN THE MENTAL LIVES OF SAVAGES AND NEUROTICS'[1]

I
THE HORROR OF INCEST

INTRODUCTION

From the very beginning, psychoanalytic research has indicated similarities and analogies between its findings regarding individual mental life
Seele [*Seelenleben*][T] and those of social psychology [*Völkerpsychologie*]. It is understandable that it did so initially only with hesitation and to a limited extent and that it did not go beyond the area of fairy tale and myth. The intention behind those strides was nothing more than to bring credibility to its highly improbable results through such unexpected points of agreement.

In the decade and a half that has passed since then, psychoanalysis has gained confidence in its work; the not inconsiderable band of researchers that followed the spur of one individual has come to a satisfying consensus of opinion, and the time now seems favourable to set a new aim for the work reaching beyond individual psychology. It is not just a matter of tracking down analogous phenomena and correspondences in the mental life of a people with those that were brought to light through the psychoanalysis of the individual, but also to dare to try to illuminate what has remained obscure and doubtful in social psychology by means of the insights of psychoanalysis. The young science of psychoanalysis would like to reimburse, so to speak, what it owed other disciplines at its inception, and it hopes to be able to give back more than it received.

A difficulty in this undertaking resides in the qualifications of the men who must perform this new task. It would be futile to expect

1 [These opening passages of the 1912 edition of the first of the four essays that comprise *Totem and Taboo* were replaced by a new Preface when they were published together in book form in 1913. See Editors' Note (p. 5 above) for bibliographic details.]

investigators of myth, psychologists of religion, ethnologists, linguists, etc., to start applying psychoanalytic ways of thinking to their own material. The first steps in all these directions must surely be undertaken by those who have mastered the psychoanalytic technique and its findings, hitherto as psychiatrists or dream researchers. But they are still laymen in the other disciplines; and if they have taken the trouble to acquire some knowledge of them, they are dilettantes or autodidacts at best. Their work cannot avoid weaknesses and errors that will easily be discovered and probably pursued with scornful derision by the professional researchers, the specialists, with their mastery of the material and their practised handling of it. May it be taken into consideration that our work indeed has no other object than to prompt them to improve upon it themselves, by investigating their familiar material with the instrument we can lend them.

I must make yet another apology for the small piece of work presented here, apart from the fact that it represents the author's first step upon hitherto unfamiliar ground. It is also the case that for various external reasons it was forced prematurely into the light of publication, after a far shorter period of incubation than the author's previous contributions, long before it was possible for him to work through the extensive literature on the topic. When I nevertheless did not delay publication, I was reassured by the consideration that first works in any event frequently suffer from trying to cover too much ground and striving for a complete resolution which, as subsequent studies show, simply cannot be attained at the first approach. It therefore does little harm if one deliberately and knowingly limits oneself to a small experiment. Besides, the author finds himself in the situation of the boy in the forest who finds a trove of magnificent berries and good mushrooms, and calls his companions over, before he has picked them all himself, because he sees that he alone cannot cope with the abundance.

PARALLELS IN THE ONTOGENETIC AND PHYLOGENETIC DEVELOPMENT OF MENTAL LIFE

Phantasie, Bildung

For those involved in the development of psychoanalytic research, it was a memorable occasion when C. G. Jung announced at a private scientific meeting, through one of his pupils, that the phantasies [*Phantasiebildungen*][T] of some mental patients (dementia praecox) coincide in the most conspicuous fashion with the mythological cosmogonies of ancient peoples, scientific

information about which could not possibly have reached the uneducated patient.[1] This did not only indicate a new source for the most remarkable pathological psychical products, it also stressed in the most emphatic fashion the significance of the parallelism between ontogenetic and phylogenetic development – even in mental life.[2] With this, mental patients and neurotics move into proximity with primitives, the people of remote prehistory; and if the suppositions of psychoanalysis are correct, then what is common to them must be traceable to the type of infantile mental life.

SIGNIFICANCE OF SAVAGE PEOPLES FOR PSYCHOLOGY[3]

1 At the 1910 Psychoanalytical Congress. The pupil entrusted with the lecture was the gifted [Johann Jakob] Honegger, since deceased. Jung himself and his pupils (Nelken, Spielrein) have in other works since pursued the ideas first touched on then. (Cf. Jung, 1911–12.) [See also Freud's (1912*a*) Postscript to the Schreber case, *RSE*, **12**, 69 ff., which was originally presented at the 1911 Weimar Congress.]

2 [This line of thought, namely the extension to psychology of Ernst Haeckel's 'biogenetic law' to the effect that ontogeny recapitulates phylogeny (see Sulloway, 1979), was explicitly taken up in Freud (1913*j*) and especially (1985*a* [1915]).]

3 [After this heading, in all editions after 1910, the text continues with the opening sentence of the first essay of *Totem and Taboo*: 'Prehistoric man, in the various stages of his development . . .'.]

ENGLISH TRANSLATIONS

'The Claims of Psycho-Analysis to Scientific Interest'
1955 *SE*, **13**, 165–90. (Tr. James Strachey.)
1986 *PFL*, **15**, 29–56. (Reprint of above.)

The present translation is a revised and corrected reprint of the *SE* version.

This paper was written by Freud at the express request of the editor of *Scientia*, the well-known Italian scientific periodical. The precise dates of its publication were probably September and November, 1913. It is the only at all comprehensive account that he gave of the non-medical applications of psychoanalysis.

THE CLAIMS OF PSYCHOANALYSIS TO SCIENTIFIC INTEREST

PART I
THE PSYCHOLOGICAL INTEREST OF PSYCHOANALYSIS

Psychoanalysis is a medical procedure which aims at the cure of certain [165]
forms of nervous disease (the neuroses) by a psychological technique. In a small volume published in 1910[I] I described the evolution of psychoanalysis from Josef Breuer's cathartic procedure and its relation to the theories of Charcot and Pierre Janet.

We may give as instances of disorders that are accessible to psychoanalytic treatment hysterical convulsions and paralyses as well as the various symptoms of obsessional neurosis (obsessive ideas and actions). All of these are conditions which are occasionally subject to spontaneous recovery and are dependent on the personal influence of the physician in a haphazard fashion which has not yet been explained. Psychoanalysis has no therapeutic effect on the severer forms of mental disorder [*Geistesstörungen*][T] properly so called. But – for the first time in the *Geist*
history of medicine – psychoanalysis has made it possible to get some insight into the origin and mechanism alike of the neuroses and psychoses.

This medical significance of psychoanalysis would not, however, justify me in bringing it to the notice of a circle of *savants* concerned in the synthesis of the sciences. And such a plan must seem particularly premature so long as a large number of psychiatrists and neurologists are opposed to the new therapeutic method and reject both its postulates and its findings. If, nevertheless, I regard the experiment as a legitimate one, it is because psychoanalysis can also claim to be of interest to others than psychiatrists, since it touches upon various other spheres of knowledge and reveals unexpected relations between them and the pathology of mental life [*Seelenlebens*].

1 *Five Lectures on Psychoanalysis* [1910*a*; *RSE*, **11**, 11 ff.].

[166] Accordingly in my present paper I shall leave the medical interest of psychoanalysis on one side and illustrate what I have just asserted of the young science by a series of examples.

There are a large number of phenomena related to facial and other expressive movements and to speech, as well as many processes of thought (both in normal and sick people), which have hitherto escaped the notice of psychology because they have been regarded as no more than the results of organic disorder or of some abnormal failure in function of the mental apparatus. What I have in mind are 'parapraxes' [*Fehlleistungen*][T] (slips of the tongue or pen, forgetfulness [*Versprechen*, *Verschreiben*, *Vergessen*], etc.), haphazard actions and dreams in normal people, and convulsive attacks, deliria, visions, and obsessive ideas or acts in neurotic subjects. These phenomena (insofar as they were not entirely neglected, as was the case with the parapraxes) were relegated to pathology and an attempt was made to find 'physiological' explanations for them, though these were invariably unsatisfactory. Psychoanalysis, on the contrary, has been able to show that all these things can be explained by means of hypotheses of a purely psychological nature and can be fitted into the chain of psychical events already known to us. Thus, on the one hand, psychoanalysis has narrowed the region subject to the physiological point of view and, on the other hand, has brought a large section of pathology into the sphere of psychology. In this instance the normal phenomena provide the more convincing evidence. Psychoanalysis cannot be accused of having applied to normal cases findings arrived at from pathological material. The evidence in the latter and in the former was reached independently and shows that normal processes and what are described as pathological ones follow the same rules.

I shall now discuss in greater detail two of the normal phenomena with which we are here concerned (phenomena, that is, which can be observed in normal people) – namely, parapraxes and dreams.

By parapraxes, then, I understand the occurrence in healthy and normal
[167] people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to

fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

Parapraxes are the most convenient material for anyone who wishes to convince himself of the trustworthiness of psychoanalytic explanations. In a small work, first published in book form in 1904, I presented a large number of examples of this kind, and since then I have been able to add to my collection many contributions from other observers.[1]

The commonest motive [*Motiv*][T] for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure [*Unlust*][T]. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly – only, for instance, under the pressure of some [168]
convention; one loses an object, if one has quarrelled with someone of whom the object reminds one – with its original donor, for instance; one gets on to the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned – a fact which had already been observed by many writers before psychoanalysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

In other instances the analysis of a parapraxis is less simple and requires less obvious explanations, on account of the intrusion of a

1 *The Psychopathology of Everyday Life* [Freud, 1901*b*; *RSE*, **6**]. Cf. also works on the subject by Maeder, Brill, Jones, Rank, etc. [See also Part I of Freud's *Introductory Lectures* (1916–17*a*), ibid., **15**.]

process which we describe as 'displacement' [*'Verschiebung'*][T]. One may, for instance, forget the name of someone against whom one has no objection; analysis will show, however, that the name has stirred up the memory of someone else, who has the same or a similar-sounding name and whom one has good reason to dislike. This connection has led to the innocent person's name being forgotten; the intention to forget has, as it were, been displaced along some line of association.

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss [*Verlieren*] of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying [*Verlegen*] of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better – and so on.

Nevertheless, in spite of the apparent triviality of these phenomena, the psychoanalytic explanation of parapraxes involves some slight modifica-
[169] tions in our view of the world. We find that even normal people are far more frequently moved by contradictory motives than we should have expected. The number of occurrences that can be described as 'accidental' is considerably diminished. It is almost a consolation to be able to exclude the loss of objects from among the chance events of life; our blunders often turn out to be a cover for our secret intentions. But – what is more important – many serious accidents that we should otherwise have ascribed entirely to chance reveal under analysis the participation of the subject's own volition, though without its being clearly admitted by him. The distinction between a chance accident and deliberate self-destruction, which in practice is so often hard to draw, becomes even more dubious when looked at from an analytic point of view.

The explanation of parapraxes owes its theoretical value to the ease with which they can be solved and their frequency in normal people. But the success of psychoanalysis in explaining them is far surpassed in importance by a further achievement made by it, relating to another phenomenon of normal mental life. What I have in mind is

the interpretation [*Deutung*][T] of *dreams*, which brought psychoanalysis for the first time into the conflict with official science which was to be its destiny. Medical research explains dreams as purely somatic phenomena, without meaning [*Sinn*] or significance [*Bedeutung*], and regards them as the reaction of a mental organ sunk in a state of sleep to physical stimuli which partially awaken it. Psychoanalysis raises the status of dreams into that of psychical acts possessing meaning and purpose, and having a place in the subject's mental life, and thus disregards their strangeness, incoherence and absurdity. On this view somatic stimuli merely play the part of material that is worked over in the course of the construction of the dream [*Traumbildung*][T]. There is no halfway house between these two views of dreams. What argues against the physiological hypothesis [*Auffassung*][T] is its unfruitfulness, and what may be argued in favour of the psychoanalytic one is the fact that it has translated [*übersetzt*][T] and given a meaning to thousands of dreams and has used them to throw light on the intimate details of the human mind.

Bildung

Übersetzung

I devoted a volume published in 1900 to the important subject of dream interpretation and have had the satisfaction of seeing the theories put forward in it confirmed and amplified by contributions from almost every worker in the field of psychoanalysis.[1] It is generally agreed that dream interpretation is the foundation stone of psychoanalytic work and that its findings constitute the most important contribution made by psychoanalysis to psychology.

[170]

I cannot enter here into the technique by which an interpretation of dreams is arrived at, nor can I give the grounds for the conclusions to which the psychoanalytic investigation of dreams has led. I must restrict myself to enunciating some new concepts, reporting my findings and stressing their importance for normal psychology.

Psychoanalysis, then, has demonstrated the following facts. All dreams have a meaning. Their strangeness is due to distortions that have been made in the expression of their meaning. Their absurdity is deliberate and expresses derision, ridicule and contradiction. Their incoherence is a matter of indifference for their interpretation. The dream as we remember it after waking is described by us as its 'manifest content'. In the process of interpreting this, we are led to the 'latent dream thoughts', which lie hidden behind the manifest content and which are represented by it. These latent dream thoughts are no longer strange, incoherent or absurd; they are completely valid constituents of our waking thought.

1 *The Interpretation of Dreams* (1900*a*) [*RSE*, **4–5**]. See also my shorter essay *On Dreams* (1901*a*) [ibid., **5**, 573 ff.], and other writings by Rank, Stekel, Jones, Silberer, Brill, Maeder, Abraham, Ferenczi, etc. [See further Part II of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **15**.]

We give the name of 'dream-work' to the process which transforms the latent dream thoughts into the manifest content of the dream; it is this dream-work that brings about the distortion which makes the dream thoughts unrecognizable in the content of the dream.

The dream-work is a psychological process the like of which has hitherto been unknown to psychology. It has claims upon our interest in two main directions. In the first place, it brings to our notice novel processes such as 'condensation' [*Verdichtung*][T] (of ideas [*Vorstellungen*][T]) and 'displacement' [*Verschiebung*] (of psychical emphasis from one idea to another), processes which we have never come across at all in our waking life, or only as the basis of what are known as 'errors in thought'. In the second place, it enables us to detect the operation in the mind of a play of forces [*Kräftespiel*][T] which was concealed from our conscious perception. We find that there is a 'censorship' [*Zensur*], a testing agency, at work in us, which decides whether an idea cropping up in the mind shall be allowed to reach consciousness, and which, so far as lies within its power, ruthlessly excludes anything that might produce or revive unpleasure. And it will be recalled at this point that in our analysis of parapraxes we found traces of this same intention to avoid unpleasure in remembering things and of similar conflicts between mental impulses.

[171] *Kraft*

A study of the dream-work forces on us irresistibly a view of mental life which appears to decide the most controversial problems of psychology. The dream-work compels us to assume the existence of an *unconscious* psychical activity which is more comprehensive and more important than the familiar activity that is linked with consciousness. (I shall have some more to say on this point when I come to discuss the *philosophical* interest of psychoanalysis [p. 169 f. below].) It enables us to dissect the psychical apparatus into a number of different agencies or systems, and shows us that in the system of unconscious mental activity processes operate which are of quite another kind from those perceived in consciousness.

The dream-work has only one function – namely to maintain sleep. 'Dreams are the guardians of sleep.' The dream *thoughts* themselves may serve the purposes of the most various mental functions. The dream-work accomplishes its task by representing a wish that arises from the dream thoughts as fulfilled in a hallucinatory fashion.

It may safely be said that the psychoanalytic study of dreams has given us our first insight into a 'depth psychology' whose existence had not hitherto been suspected.[1] Fundamental changes will have to be

1 Psychoanalysis does not at present postulate any relation between this psychical topography and anatomical stratification or histological layers.

introduced into normal psychology if it is to be brought into harmony with these new findings.

It is quite impossible to exhaust the psychological interest of dream interpretation within the limits of my present paper. Let us bear in mind that what I have so far stressed is merely that dreams have a [172] meaning and are objects for psychological study, and let us now proceed with our consideration of the new territory which has been annexed by psychology in the domain of pathology.

The psychological novelties inferred from dreams and parapraxes must be applicable as an explanation of other phenomena if we are to believe in the value of these novelties, or, indeed, in their existence. And we do in fact find that psychoanalysis has shown that the hypotheses of unconscious mental activity, of censorship and repression [*Verdrängung*][T] and of distortion and substitution, at which we have arrived from our study of these normal phenomena, also afford us a first understanding of a number of *pathological* phenomena and, as one might say, put into our hands the key to all the riddles of the psychology of the neuroses. Thus dreams are to be regarded as the normal prototypes of all psychopathological structures. Anyone who understands dreams can also grasp the psychical mechanism of the neuroses and psychoses.

Starting from dreams, the investigations of psychoanalysis have enabled it to construct a psychology of the neuroses which is being continuously built up piece by piece. But what we are here concerned with – the *psychological* interest of psychoanalysis – obliges us to enter more fully into only two sides of this far-reaching subject: the evidence that many pathological phenomena which had hitherto been believed to require physiological explanations are, in fact, psychical acts, and the evidence that the processes which lead to abnormal consequences can be traced back to psychical drive forces [*Triebkräfte*][T].

I will illustrate the first of these theses by a few examples. Hysterical attacks have long been recognized as signs of increased emotional excitement [*Erregung*][T] and equated with outbreaks of affect. Charcot attempted to reduce the multiplicity of their modes of manifestation by means of descriptive formulas; Pierre Janet recognized the unconscious ideas operating behind such attacks;[1] while psychoanalysis has shown that they are mimetic representations of scenes (whether actually experienced or only invented) with which the patient's [173] imagination [*Phantasie*][T] is occupied without his becoming conscious

1 [See, however, Freud's later comments on Janet's views in Section III of his *Autobiographical Study* (1925*d*), *RSE*, **20**, 26–7.]

of them. The meaning of these pantomimes is concealed from the spectators by means of condensations and distortions of the acts which they represent. And this applies equally to what are described as the 'chronic' symptoms of hysterical patients. All of them are mimetic or hallucinatory representations of phantasies [*Phantasien*] which unconsciously dominate the subject's emotional life and which have the meaning of fulfilments of secret and repressed wishes. The tormenting character of these symptoms is due to the internal conflict into which these patients' minds are driven by the need to combat such unconscious wishes.

In another neurotic disorder, obsessional neurosis [*Zwangsneurose*][T], the patients become the victims of distressing and apparently senseless ceremonials which take the form of the rhythmical repetition of the most trivial acts (such as washing or dressing) or of carrying out meaningless injunctions or of obeying mysterious prohibitions. It was nothing less than a triumph of psychoanalytic research when it succeeded in showing that all these obsessive acts [*Zwangshandlungen*], even the most insignificant and trivial of them, have a meaning, and that they are reflections, translated into indifferent terms, of conflicts in the patients' lives, of the struggle between temptations and moral restraints [*Hemmungen*][T] – reflections of the proscribed wish itself and of the punishment and atonement which that wish incurs. In another form of the same disorder the victim suffers from tormenting ideas (obsessions [*Zwangsideen*]) which force themselves upon him and are accompanied by affects whose character and intensity are often only quite inadequately accounted for by the terms of the obsessive ideas [*Zwangsideen*] themselves. Analytic investigation has shown in their case that the affects are entirely justified, since they correspond to self-reproaches which are based on something that is at least *psychically* real. But the ideas to which these affects are attached are not the original ones, but have found their way into their present position by a process of displacement – by being substituted for something that has been repressed. If these displacements can be reversed, the way is open to the discovery of the repressed ideas, and the relation between affect and idea is found to be perfectly appropriate.

[174] In another neurotic disorder, dementia praecox (paraphrenia or schizophrenia), a condition which is, in fact, incurable, the patient is left, in the most severe cases, in a state of apparently complete apathy. Often his sole remaining actions are certain movements and gestures

which are repeated monotonously and have been given the name of 'stereotypies'. An analytic investigation of residues of this kind, made by Jung, has shown that they are the remains of perfectly significant mimetic actions, which at one time gave expression to the subject's ruling wishes. The craziest speeches and the most peculiar poses and attitudes adopted by these patients become intelligible and can be given a place in the chain of their mental processes if they are approached on the basis of psychoanalytic hypotheses. [Cf. Jung, 1908.]

Similar considerations apply to the deliria and hallucinations, as well as to the delusional systems, exhibited by various psychotic patients. Where hitherto nothing but the most freakish capriciousness has seemed to prevail, psychoanalytic research has introduced law, order and connection, or has at least allowed us to suspect their presence where its work is still incomplete. The most heterogeneous forms of mental disorder are revealed as the results of processes which are at bottom identical and which can be understood and described by means of psychological concepts. What had already been discovered in the formation of dreams is operative everywhere – psychical conflict, the repression of certain drive impulses which have been pushed back into the unconscious by other mental forces, reaction-formations set up by the repressing forces, and substitutes constructed by the drives which have been repressed but have not been robbed of all their energy. The accompanying processes of condensation and displacement, so familiar to us in dreams, are also to be found everywhere. The multiplicity of clinical pictures observed by psychiatrists depends upon two other things: the multiplicity of the psychical mechanisms at the disposal of the repressive process and the multiplicity of developmental dispositions which give the repressed impulses an opportunity for breaking through into substitutive structures.

Psychoanalysis points to psychology for the solution to a good half [175]
of the problems of psychiatry. It would nevertheless be a serious mistake to suppose that analysis favours or aims at a *purely* psychological view of mental disorders. It cannot overlook the fact that the other half of the problems of psychiatry are concerned with the influence of organic factors (whether mechanical, toxic or infective) on the mental apparatus. Even in the case of the mildest of these disorders, the neuroses, it makes no claim that their origin is purely psychogenic but traces their aetiology to the influence upon mental life of an unquestionably organic factor to which I shall refer later [p. 171 f. below].

The number of detailed psychoanalytic findings which cannot fail to be of importance for general psychology is too great for me to enumerate them here. I will mention only two other points: psychoanalysis unhesitatingly ascribes the primacy in mental life to affective processes, and it reveals an unexpected amount of affective disturbance and blinding of the intellect in normal no less than in sick people.

PART II
THE CLAIMS OF PSYCHOANALYSIS TO THE INTEREST OF THE NON-PSYCHOLOGICAL SCIENCES

(A) THE PHILOLOGICAL INTEREST OF PSYCHOANALYSIS

I shall no doubt be overstepping common linguistic usage in postulating an interest in psychoanalysis on the part of philologists, that is of experts in language [*Sprache*]. For in what follows 'language' must be understood not merely to mean the expression of thought in words but to include the language of gesture and every other method, such, for instance, as writing, by which mental activity can be expressed. That being so, it may be pointed out that the interpretations made by psychoanalysis are first and foremost translations [*Übersetzungen*] from an alien method of expression into the one which is familiar to us. When we interpret a dream we are simply translating a particular thought content (the latent dream thoughts) from the 'language of dreams' into our waking language. In the course of doing so we learn the peculiarities of this dream language and it is borne in upon us that it forms part of a highly archaic system of expression. Thus, to take an instance, there is no special indication for the negative in the language of dreams. Contraries may stand for each other in the dream's content and may be represented by the same element. Or we may put it like this: concepts are still ambivalent in dream language, and unite within themselves contrary meanings – as is the case, according to the hypotheses of philologists, in the oldest roots of historical languages.[1] Another striking feature of our dream language is its extremely frequent use of symbols, which make us able to some extent to translate the content of dreams without reference to the associations [*Associationen*][T] of the individual dreamer. Our researches have not yet sufficiently elucidated the essential nature of these symbols. They are in part substitutes and analogies based upon obvious similarities; but in some of these symbols the *tertium comparationis* which is presumably present escapes our conscious knowledge. It is precisely this latter class of symbols which must probably originate from the earliest

[176]

[177]

1 Cf. Abel [1884] on the antithetical meaning of primal words, and my review of his paper [1910*e*; *RSE*, **11**, 143 ff.].

phases of linguistic development and conceptual construction. In dreams it is above all the sexual organs and sexual activities which are represented symbolically instead of directly. A philologist, Hans Sperber, of Uppsala, has only recently (1912) attempted to prove that words which originally represented sexual activities have, on the basis of analogies of this kind, undergone an extraordinarily far-reaching change in their meaning.

If we reflect that the means of representation in dreams are principally visual images and not words, we shall see that it is even more appropriate to compare dreams with a system of writing than with a language. In fact the interpretation of dreams is completely analogous to the decipherment of an ancient pictographic script such as Egyptian hieroglyphs. In both cases there are certain elements which are not intended to be interpreted (or read, as the case may be) but are only designed to serve as 'determinatives', that is to establish the meaning of some other element. The ambiguity of various elements of dreams finds a parallel in these ancient systems of writing; and so too does the omission of various relations, which have in both cases to be supplied from the context. If this conception of the method of representation in dreams has not yet been followed up, this, as will be readily understood, must be ascribed to the fact that psychoanalysts are entirely ignorant of the attitude and knowledge with which a philologist would approach such a problem as that presented by dreams.

The language of dreams may be looked upon as the method by which unconscious mental activity expresses itself. But the unconscious speaks more than one dialect. According to the differing psychological conditions governing and distinguishing the various forms of neurosis, we find regular modifications in the way in which unconscious mental impulses are expressed. While the gesture language of hysteria agrees on the whole with the picture language of dreams and visions, etc., the
[178] thought language of obsessional neurosis and of the paraphrenias (dementia praecox and paranoia) exhibits special idiomatic peculiarities which, in a number of instances, we have been able to understand and interrelate. For instance, what a hysteric expresses by vomiting an obsessional will express by painstaking protective measures against infection, while a paraphrenic will be led to complaints or suspicions that he is being poisoned. These are all of them different representations of the patient's wish to become pregnant which have been repressed into the unconscious, or of his defensive reaction [*Abwehr*][T] against that wish.

(B) THE PHILOSOPHICAL INTEREST OF PSYCHOANALYSIS

Philosophy, insofar as it is built on psychology, will be unable to avoid taking the psychoanalytic contributions to psychology fully into account and reacting to this new enrichment of our knowledge just as it has to every considerable advance in the specialized sciences. In particular, the setting up of the hypothesis of unconscious mental activities must compel philosophy to decide one way or the other and, if it accepts the idea, to modify its own views on the relation of mind to body so that they may conform to the new knowledge. It is true that philosophy has repeatedly dealt with the problem of the unconscious, but, with few exceptions, philosophers have taken up one or other of the two following positions. Either their unconscious has been something mystical, something intangible and undemonstrable, whose relation to the mind has remained obscure, or they have identified the mental with the conscious and have proceeded to infer from this definition that what is unconscious cannot be mental or a subject for psychology. These opinions must be put down to the fact that philosophers have formed their judgement on the unconscious without being acquainted with the phenomena of unconscious mental activity, and therefore without any suspicion of how far unconscious phenomena resemble conscious ones or of the respects in which they differ from them. If anyone possessing that knowledge nevertheless holds to the conviction which equates the conscious and the psychical and consequently denies the unconscious the attribute of being psychical, no objection can, of course, be made except that such a distinction [179] turns out to be highly unpractical. For it is easy to describe the unconscious and to follow its developments if it is approached from the direction of its relation to the conscious, with which it has so much in common. On the other hand, there still seems no possibility of approaching it from the direction of physical events. So that it is bound to remain a matter for psychological study.

There is yet another way in which philosophy can derive a stimulus from psychoanalysis, and that is by itself becoming a subject of psychoanalytic research. Philosophical theories and systems have been the work of a small number of men of striking individuality. In no other science does the personality of the scientific worker play anything like so large a part as in philosophy. And now for the first time psychoanalysis enables us to construct a 'psychography' of a personality. (See the sociological section below, p. 177 f.) It teaches us to recognize the affective units – the complexes dependent on drives – whose presence is to be presumed in

each individual, and it introduces us to the study of the transformations and end products arising from these drive forces. It reveals the relations of a person's constitutional disposition and the events of his life to the achievements open to him owing to his peculiar gifts. It can conjecture with more or less certainty from an artist's work the intimate personality that lies behind it. In the same way, psychoanalysis can indicate the subjective and individual motives behind philosophical theories which have ostensibly sprung from impartial logical work, and can draw a critic's attention to the weak spots in the system. It is not the business of psychoanalysis, however, to undertake such criticism itself, for, as may be imagined, the fact that a theory is psychologically determined does not in the least invalidate its scientific truth.

(c) THE BIOLOGICAL INTEREST OF PSYCHOANALYSIS

It has not been the fate [*Schicksal*][T] of psychoanalysis to be greeted (like other young sciences) with the sympathetic encouragement of those who are interested in the advance of knowledge. For a long time it was disregarded, and when at last it could no longer be neglected it
[180] became, for emotional reasons, the object of the most violent attacks from people who had not taken the trouble to become acquainted with it. It owed this unfriendly reception to a single circumstance: for at an early stage of its researches psychoanalysis was driven to the conclusion that nervous illnesses are an expression of a disturbance of the sexual function and it was thus led to devote its attention to an investigation of that function – one which had been far too long neglected. But anyone who respects the rule that scientific judgement should not be influenced by emotional attitudes will assign a high degree of biological interest to psychoanalysis on account of these very investigations and will regard the resistances to it as actual evidence in favour of the correctness of its assertions.

Psychoanalysis has done justice to the sexual function in man by making a detailed examination of its importance in mental and practical life – an importance which has been emphasized by many creative writers and by some philosophers, but which has never been recognized by science.[1] But in the first place it was necessary to enlarge the unduly restricted concept of sexuality, an enlargement that was justified by reference to the extensions of sexuality occurring in the so-called perversions and to the behaviour of children. It turned

1 [See Freud's *Three Essays on the Theory of Sexuality* (1905*d*), *RSE*, **7**, 115 ff.]

out to be impossible to maintain any longer that childhood was asexual and was invaded for the first time by a sudden inrush of sexual impulses at the age of puberty. On the contrary, when once the blinkers of partiality and prejudice had been removed, observation had no difficulty in revealing that sexual interests and activities are present in the human child at almost every age and from the very first. The importance of this infantile sexuality is not impaired by the fact that we cannot everywhere draw a clear line between it and a child's asexual activity. It differs, however, from what is described as the 'normal' sexuality of adults. It includes the germs of all those sexual activities which in later life are sharply contrasted with normal sexual life as being perversions, and as such bound to seem incomprehensible and vicious. The normal sexuality of adults emerges from infantile sexuality by a series of developments, combinations, divisions and suppressions, which are scarcely ever achieved with ideal perfection [181] and consequently leave behind predispositions to a retrogression of the function in the form of illness.

Infantile sexuality exhibits two other characteristics which are of importance from a biological point of view. It turns out to be put together from a number of component drives which seem to be attached to certain regions of the body ('erotogenic zones') and some of which emerge from the beginning in pairs of opposites – drives with an active and a passive aim. Just as in later life what is loved is not merely the object's sexual organs but his whole body, so from the very first it is not merely the genitals but many other parts of the body which are the seat of sexual excitation and respond to appropriate stimuli with sexual pleasure. This fact is closely related to the second characteristic of infantile sexuality – namely that to start with it is attached to the self-preservative functions of nutrition and excretion, and, in all probability, of muscular excitation and sensory activity.

If we examine sexuality in the adult with the help of psychoanalysis, and consider the life of children in the light of the knowledge thus gained, we perceive that sexuality is not merely a function serving the purposes of reproduction, on a par with digestion, respiration, etc. It is something far more independent, which stands in contrast to all the individual's other activities and is forced into an alliance with the individual's economy only after a complicated course of development involving the imposition of numerous restrictions. Cases, theoretically quite conceivable, in which the interests of these sexual impulses fail to coincide with the self-preservation of the individual seem actually

to be presented by the group of neurotic illnesses. For the final formula which psychoanalysis has arrived at on the nature of the neuroses runs thus: The primal conflict which leads to neuroses is one between the sexual drives and those which maintain the ego [*Ich*][T]. The neuroses represent a more or less partial overpowering of the ego by sexuality after the ego's attempts at suppressing sexuality have failed.

We have found it necessary to hold aloof from biological considerations during our psychoanalytic work and to refrain from using them
[182] for heuristic purposes, so that we may not be misled in our impartial judgement of the psychoanalytic facts before us. But after we have completed our psychoanalytic work we shall have to find a point of contact with biology; and we may rightly feel glad if that contact is already assured at one important point or another. The contrast between the ego drives and the sexual drive, to which we have been obliged to trace back the origin of the neuroses, is carried into the sphere of biology in the contrast between the drives which serve the preservation of the individual and those which serve the survival of the species. In biology we come upon the more comprehensive conception of an immortal germ-plasm to which the different transitory individuals are attached like organs that develop successively. It is only this conception which enables us rightly to understand the part played by the sexual drive forces in physiology and psychology.

In spite of all our efforts to prevent biological terminology and considerations from dominating psychoanalytic work, we cannot avoid using them even in our descriptions of the phenomena that we study. We cannot help regarding the term 'drive' as a concept on the frontier between the spheres of psychology and biology. We speak, too, of 'masculine' and 'feminine' mental attributes and impulses, although, strictly speaking, the differences between the sexes can lay claim to no special psychical characterization. What we speak of in ordinary life as 'masculine' or 'feminine' reduces itself from the point of view of psychology to the qualities of 'activity' and 'passivity' – that is, to qualities determined not by the drives themselves but by their aims. The regular association of these 'active' and 'passive' drives in mental life reflects the bisexuality of individuals, which is among the clinical postulates of psychoanalysis.

I shall be satisfied if these few remarks have drawn attention to the many respects in which psychoanalysis acts as an intermediary between biology and psychology.

(D) THE INTEREST OF PSYCHOANALYSIS FROM A DEVELOPMENTAL POINT OF VIEW

Not every analysis of psychological phenomena deserves the name of psychoanalysis. The latter implies more than the mere analysis of com- [183]
posite phenomena into simpler ones. It consists in tracing back one psychical structure to another which preceded it in time and out of which it developed. Medical psychoanalytic procedure was not able to eliminate a symptom until it had traced that symptom's origin and development. Thus from the very first psychoanalysis was directed towards tracing developmental processes. It began by discovering the genesis of neurotic symptoms, and was led, as time went on, to turn its attention to other psychical structures and to construct a genetic [*genetischen*][T] psychology which would apply to them too.

Psychoanalysis has been obliged to derive the mental life of adults from that of children, and has had to take seriously the old saying that the child is father to the man. It has traced the continuity between the infantile and adult mind, and has also noted the transformations and rearrangements that occur in the process. In most of us there is a gap in our memories covering the first years of our childhood, of which only a few fragmentary recollections survive. Psychoanalysis may be said to have filled in this gap and to have abolished man's infantile amnesia. (See the section on 'Educational Interest' below [p. 178 f.].)

Some notable discoveries have been made in the course of this investigation of the infantile mind. Thus it has been possible to confirm, what has often already been suspected, the extraordinarily important influence exerted by the impressions of childhood (and particularly by its earliest years) on the whole course of later development. This brings us up against a psychological paradox – which for psychoanalysts alone is no paradox – that it is precisely these most important of all impressions that are not remembered in later years. Psychoanalysis has been able to establish the decisive and indestructible character of these earliest experiences in the clearest possible way in the case of sexual life. '*On revient toujours à ses premiers amours*' is sober truth. The many riddles in the sexual life of adults can only be solved if stress is laid on the infantile factors in love. Theoretical light is thrown on their influence by the consideration that an individual's first experiences in childhood do not occur only by chance but also correspond to the first activities of his innate or constitutional drive dispositions.

Another and far more surprising discovery has been that, in spite of all [184]

the later development that occurs in the adult, none of the infantile mental formations perishes. All the wishes, drive impulses, modes of reaction and attitudes of childhood are still demonstrably present in maturity and in appropriate circumstances can emerge once more. They are not destroyed but merely overlaid – to use the spatial mode of description which psychoanalytic psychology has been obliged to adopt. Thus it is part of the nature of the mental past that, unlike the historic past, it is not absorbed by its derivatives; it persists (whether actually or only potentially) alongside what has proceeded from it. The proof of this assertion lies in the fact that the dreams of normal people revive their childhood characters every night and reduce their whole mental life to an infantile level. This same return to psychical infantilism ('regression') appears in the neuroses and psychoses, whose peculiarities may to a great extent be described as psychical archaisms. The strength in which the residues of infancy are still present in the mind shows us the amount of disposition to illness; that disposition may accordingly be regarded as an expression of an inhibition in development. The part of a person's psychical material which has remained infantile and has been repressed as being unserviceable constitutes the core of his unconscious. And we believe we can follow in our patients' life histories the way in which this unconscious, held back as it is by the forces of repression, lies in wait for a chance to become active and makes use of its opportunities if the later and higher psychical structures fail to master the difficulties of real life.

In the last few years psychoanalytic writers[1] have become aware that the principle that 'ontogeny is a recapitulation of phylogeny'[2] must be applicable to mental life; and this has led to a fresh extension of psychoanalytic interest.

(E) THE INTEREST OF PSYCHOANALYSIS FROM THE POINT OF VIEW OF THE HISTORY OF CIVILIZATION

[185] The comparison between the childhood of individual men and the early history of societies has already proved its fruitfulness in several directions, even though the study has scarcely more than begun. In this connection the psychoanalytic mode of thought acts like a new instrument of research. The application of its hypotheses to social psychology enables us both to raise fresh problems and to see old ones in a fresh light and contribute towards their solution.

1 Abraham, Spielrein and Jung.

2 [An allusion to Haeckel's biogenetic law (see 1905*d*; *RSE*, **7**, 116 f.).]

In the first place, it seems quite possible to apply the psychoanalytic views derived from dreams to products of ethnic imagination such as myths and fairy tales.[1] The need to interpret such productions [*Gebilde*] has long been felt; some 'secret meaning' has been suspected to lie behind them and it has been presumed that that meaning is concealed by changes and transformations. The study made by psychoanalysis of dreams and neuroses has given it the necessary experience to enable it to guess the technical procedures that have governed these distortions. But in a number of instances it can also reveal the hidden motives which have led to this modification in the original meaning of myths. It cannot accept as the first impulse to the construction of myths a theoretical craving for finding an explanation of natural phenomena or for accounting for cult observances and usages which have become unintelligible. It looks for that impulse in the same psychical 'complexes', in the same emotional trends, which it has discovered at the base of dreams and symptoms.

A similar application of its points of view, its hypotheses and its findings has enabled psychoanalysis to throw light on the origins of our great cultural [*kulturellen*][T] institutions – on religion, morality, justice and philosophy.[2] By examining the primitive psychological situations which were able to provide the motive for creations of this kind, it has been in a position to reject certain attempts at an explanation that were based on too superficial a psychology and to replace them with a more penetrating insight. *Kultur*

Psychoanalysis has established an intimate connection between these psychical achievements of individuals on the one hand and societies on the other by postulating one and the same dynamic source for both of them. It starts out from the basic idea that the principal function of the mental mechanism is to relieve the individual from the tensions created in him by his needs. One part of this task can be achieved by extracting satisfaction from the external world; and for this purpose it is essential to have control over the real world. But the satisfaction of another part of these needs – among them certain affective impulses – is regularly frustrated by reality. This leads to the further task of finding some other means of dealing with the unsatisfied impulses. The whole course of the history of civilization [*Kulturgeschichte*] is no more than an account of the various methods adopted by mankind for 'binding' their unsatisfied wishes, which, according to changing conditions (modified, moreover, [186]

1 Cf. Abraham, Rank and Jung.

2 For some first attempts in this direction, see Jung (1911–12) and Freud (1912–13*a*).

by technological advances), have been met by reality sometimes with favour and sometimes with frustration [*Versagung*][T].

An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.[1] A whole number of mental structures [*Bildungen*][T] can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure [*Unlustvermeidung*] dominates human actions until it is replaced with the better one of adaptation to the external world. *Pari passu* with men's progressive control over the world goes a development in their *Weltanschauung*, their view of the world as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

Our knowledge of the neurotic illnesses of individuals has been of much assistance to our understanding of the great social institutions. For the neuroses themselves have turned out to be attempts to find *individual* solutions to the problems of compensating for unsatisfied wishes, while the institutions seek to provide *social* solutions to these same problems.
[187] The recession of the social factor and the predominance of the sexual one turn these neurotic solutions to the psychological problem into caricatures which are of no service except to help us in explaining such important questions.

(F) THE INTEREST OF PSYCHOANALYSIS FROM THE POINT OF VIEW OF THE SCIENCE OF AESTHETICS

Psychoanalysis throws a satisfactory light upon some of the problems concerning arts and artists; but others escape it entirely. In the exercising of an art it sees once again an activity intended to allay ungratified wishes – in the first place in the creative artist himself and subsequently in his audience or spectators. The driving forces [*Triebkräfte*][T] of artists are the same conflicts which drive other people into neurosis and have encouraged society to construct its institutions. Whence it is that the artist derives his creative capacity is not a question for psychology. The artist's first aim is to set himself free and, by communicating his work to other

1 Cf. Ferenczi (1913*c*) and Freud (1912–13*a*), Chapter III [above, p. 84 ff.].

people suffering from the same arrested desires, he offers them the same liberation.[1] He represents his most personal wishful phantasies as fulfilled; but they only become a work of art when they have undergone a transformation which softens what is offensive in them, conceals their personal origin and, by obeying the laws of beauty, bribes other people with a bonus of pleasure. Psychoanalysis has no difficulty in pointing out, alongside the manifest part of artistic enjoyment, another that is latent though far more potent, derived from the hidden sources of drive liberation. The connection between the impressions of the artist's childhood and his life history on the one hand and his works, as reactions to those impressions, on the other is one of the most attractive subjects of analytic examination.[2]

For the rest, most of the problems of artistic creation and appreciation await further study, which will throw the light of analytic knowledge on them and assign them their place in the complex structure presented by [188]
the compensation for human wishes. Art is a conventionally accepted reality in which, thanks to artistic illusion, symbols and substitutes are able to provoke real emotions. Thus art constitutes a region halfway between a reality which frustrates wishes and the wish-fulfilling world of the imagination – a region in which, as it were, primitive man's strivings for omnipotence are still in full force.

(G) THE SOCIOLOGICAL INTEREST OF PSYCHOANALYSIS

It is true that psychoanalysis has taken the individual mind as its subject, but in investigating the individual it could not avoid dealing with the emotional basis of the relation of the individual to society. It has found that the social feelings invariably contain an erotic element – an element which, if it is overemphasized and then repressed, becomes one of the marks of a particular group of mental disorders. Psychoanalysis has recognized that in general the neuroses are asocial in their nature and that they always aim at driving the individual out of society and at replacing the safe monastic seclusion of earlier days with the isolation of illness. The intense feeling of guilt which dominates so many neuroses has been shown to be a social modification of neurotic anxiety.

On the other hand, psychoanalysis has fully demonstrated the part played by social conditions and requirements in the causation of

1 Cf. Rank (1907).

2 Cf. Rank (1912*c*). See also, for the application of psychoanalysis to aesthetic problems, my book on *Jokes* (Freud, 1905*c*; *RSE*, **8**). [Cf. also Freud's studies on Leonardo (1910*c*), *RSE*, **11**, 61 ff., and Michelangelo (1914*b*), below, p. 205 ff.]

neurosis. The forces which, operating from the ego, bring about the restriction and repression of drive owe their origin essentially to compliance with the demands of civilization. A constitution and a set of childhood experiences which, in other cases, would inevitably lead to a neurosis will produce no such result where this compliance is absent or where these demands are not made by the social circle in which the particular individual is placed. The old assertion that the increase in nervous disorders is a product of civilization is at least a half-truth. Young people are brought into contact with the demands of civilization by upbringing [*Erziehung*]^{T} and example; and if drive repression occurs independently of these two factors, it is a plausible hypothesis to suppose that a primaeval and prehistoric demand has at last become part of the organized
[189] and inherited endowment of mankind. A child who produces drive repressions spontaneously is thus merely repeating a part of the history of civilization. What is today an act of internal restraint was once an external one, imposed, perhaps, by the necessities of the moment; and, in the same way, what is now brought to bear upon every growing individual as an external demand of civilization may some day become an internal disposition to repression.

(H) THE EDUCATIONAL INTEREST OF PSYCHOANALYSIS

The overmastering interest which must be felt in psychoanalysis by the theory of education is based upon a fact which has become evi-
Einfühlung dent. Only someone who can feel his way into [*einfühlen*]^{T} the minds of children can be capable of educating them; and we grown-up people cannot understand children because we no longer understand our own childhood. Our infantile amnesia proves that we have grown estranged from our childhood. Psychoanalysis has brought to light the wishes, the thought structures and the developmental processes of childhood. All earlier attempts in this direction have been in the highest degree incomplete and misleading because they have entirely overlooked the inestimably important factor of sexuality in its physical and mental manifestations. The incredulous astonishment which meets the most certainly established findings of psychoanalysis on the subject of childhood – the Oedipus complex, self-love (or 'narcissism'), the disposition to perversions, anal erotism, sexual curiosity – is a measure of the gulf which separates our mental life, our judgements of value and, indeed, our processes of thought from those of even normal children.

When educators have become familiar with the findings of psychoanalysis, it will be easier for them to reconcile themselves to certain phases of infantile development and they will, among other things, not be in danger of overestimating the importance of the socially unserviceable or perverse drive impulses which emerge in children. On the contrary they will refrain from any attempt at forcibly suppressing such impulses, when they learn that efforts of this kind often produce no less undesirable results than the alternative, which is so much dreaded by educators, of giving free play to children's naughtiness. The forcible suppression of strong drives by external means never [190]
has the effect in a child of these drives being extinguished or brought under control; it leads to repression, which establishes a predisposition to later nervous illness. Psychoanalysis has frequent opportunities of observing the part played by inopportune and undiscerning severity of upbringing in the production of neuroses, or the price, in loss of efficiency and of capacity for enjoyment, which has to be paid for the normality upon which the educator insists. And psychoanalysis can also show what precious contributions to the formation of character are made by these asocial and perverse drives in the child, if they are not subjected to repression but are diverted from their original aims to more valuable ones by the process known as 'sublimation'. Our highest virtues have grown up, as reaction-formations and sublimations, out of our worst dispositions. Education should scrupulously refrain from burying these precious springs of action and should restrict itself to encouraging the processes by which these energies are led along safe paths. Whatever we can expect in the way of prophylaxis against neurosis in the individual lies in the hands of a psychoanalytically enlightened education.[1]

It has not been my aim in my present paper to lay before a scientifically orientated public an account of the compass and content of psychoanalysis or of its hypotheses, problems and findings. My purpose will have been fulfilled if I have made clear the many spheres of knowledge in which psychoanalysis is of interest and the numerous links which it has begun to forge between them.

OBSERVATIONS AND EXAMPLES FROM ANALYTIC PRACTICE

(1913)

EDITORS' NOTE

ERFAHRUNGEN UND BEISPIELE AUS DER ANALYTISCHEN PRAXIS

GERMAN EDITIONS

1913 *Int. Z. ärztl. Psychoan.*, **1** (4), 377–82. (Nos. 1, 2, 3, 4, 9, 10, 13, 15, 19, 20, 21 and 22 by Freud.) [192]
1928 *GS*, **11**, 301–3. (Introduction and Nos. 13, 15, 19 and 22.)
1931 *Neurosenlehre und Technik*, 306–8. (Introduction and Nos. 13, 15, 19 and 22.)
1946 *GW*, **10**, 40–2. (Introduction and Nos. 13, 15, 19 and 22.) Nos. 1, 2, 3, 9, 10, 19 and 20 were included in *Die Traumdeutung* from the 4th edition (1914) onwards.
1972 *SA*, **2**, 239, 349–50, 398–9. (Nos. 1, 2, 3, 4, 9, 10 and 20.)
1987 *GW*, **Nachtr.**, 614–19. (Complete.)

ENGLISH TRANSLATION

'Observations and Examples from Analytic Practice'
1955 *SE*, **13**, 193–8. (Complete, Tr. James Strachey.)

The present translation is a slightly revised reprint of the *SE* version.

On its first appearance in the *Zeitschrift* this comprised twenty-two short items. Of these twelve were by Freud, nine by Ferenczi and one by Tausk. There was also an introduction, the authorship of which was not stated, but which was presumably by Freud since it was included in the *Gesammelte Schriften*. (Cf. also the footnote on p. 185 below.) Seven of Freud's items were later included in the 4th and subsequent editions of *Die Traumdeutung* (in a slightly modified form, translations of which can be found in the relevant places in the *RSE* – as detailed in the footnotes below). The introduction and four of Freud's items were reprinted in the *GS* and the *GW*. One of these, however, was in fact among those included in *Die Traumdeutung*. This left two items (nos. 4 and 21). The whole of Freud's share in the original paper has now been reprinted in full in *GW*, **Nachtr.**, and is likewise translated here in complete form. It has seemed simplest to retain the original numbering of the items; it will be understood that the absent numbers refer to the contributions of Ferenczi and Tausk.

OBSERVATIONS AND EXAMPLES FROM ANALYTIC PRACTICE

The collection of short contributions, of which we here present a first instalment, calls for a few introductory words. The cases of illness which come under a psychoanalyst's observation are of course of unequal value in adding to his knowledge. There are some on which he has to bring to bear all that he knows and from which he learns nothing; and there are others which show him what he already knows in a particularly clearly marked manner and in exceptionally revealing isolation, so that he is indebted to them not only for a confirmation but for an extension of his knowledge. We are justified in supposing that the psychical processes which we wish to study are no different in the first class of cases from what they are in the second, but we shall choose to describe them as they occur in the favourable and clear examples afforded by the latter. Similarly, the theory of evolution assumes that in the animal kingdom the segmentation of the egg proceeds in the same manner in those cases where a high degree of pigmentation is present and which are unfavourable for observation, as it does in those cases where the object of study is transparent and poorly pigmented and which are on that account selected for observation.[1] [193]

But the numerous apt examples, which, in the course of an analyst's daily work, bring him a confirmation of what he already knows, are for the most part lost to view, since their collection into a larger whole often involves long delays. There is therefore some advantage in the provision of a framework within which observations and examples of this kind can be published and made generally known without waiting to be worked over from a more generalized point of view. [194]

Under the heading which is here introduced space will be offered for

1 [The same analogy (though explicitly mentioning sea-urchins' eggs) had been used by Breuer with a similar bearing at the beginning of his summing up of the case of Anna O. in *Studies on Hysteria* (Breuer & Freud, 1895*d*), *RSE*, **2**, 38. This may perhaps be taken as indirectly confirming Freud's authorship of these introductory remarks. (See Editors' Note, p. 183 above.)]

material of this kind. Communications should be kept as concise as possible. The different items are arranged in no particular order.[1]

(1)
DREAM WITH AN UNRECOGNIZED PRECIPITATING CAUSE

A good sleeper awoke one morning at a summer resort in the Tyrol, knowing that he had had a dream that the Pope was dead. He could think of no explanation for it. During the morning of the same day his wife said to him: 'Did you hear the dreadful noise the bells made early this morning?' He had not heard it but had evidently dreamt about it. The interpretation [*Deutung*]^{T} which his dream gave of the bells was his revenge on the pious Tyrolese. According to the newspapers the Pope was slightly indisposed at that time.[2]

(2)
THE TIME OF DAY IN DREAMS

This very often stands for the age of the dreamer at some particular period in his childhood. In one dream a quarter-past five in the morning meant the age of five years and three months, which was significant, since that was the dreamer's age at the time of the birth of his younger brother. – Many similar examples.[3]

(3)
REPRESENTATION OF AGES IN DREAMS

[195] A woman dreamt that she was walking with two little girls whose ages differed by fifteen months. She was unable to recall any family of her *Einfall* acquaintance to whom this would apply. It occurred to her [*fällt ihr ein*]^{T} that both the children represented herself and that the dream was reminding her that the two traumatic events of her childhood were separated from each other by fifteen months ($3^{1}/_{2}$ and $4^{3}/_{4}$).

1 [A further instalment of observations under the same heading, published a year later (*Int. Z. ärztl. Psychoan.*, **2** (1914), 377), included one contribution by Freud: 'A "Great Achievement" in a Dream'. This was partly incorporated into Chapter VI (F) of *The Interpretation of Dreams*, and can be found in full in *RSE*, **5**, 368–9. A third and last instalment, published in 1915, contained nothing of Freud's.]

2 [A longer version of this dream can be found in Chapter V (C) of *The Interpretation of Dreams*, ibid., **4**, 206. We know from Grubrich-Simitis (1993) that this was a dream of Freud's own.]

3 [This and the next item are included, with some verbal differences, in Chapter VI (F) of *The Interpretation of Dreams*, *RSE*, **5**, 366.]

(4)
POSITION WHEN WAKING FROM A DREAM

A woman dreamt that she was lying on her back and pressing the soles of her feet against those of another woman. The analysis made it seem probable that she was thinking of scenes of romping which she had substituted for the memory of an observation of sexual intercourse. When she woke up she noticed that, on the contrary, she had been lying on her stomach with her arms crossed, and had thus been imitating the position of a man and his embrace.

(9)
TWO ROOMS AND ONE ROOM

He had a dream in which he saw two familiar rooms which had been made into one.

Nothing factual. The dream pointed to the female genitals and the anus, which, as a child, he had regarded as one area, the 'bottom' (in accordance with the infantile 'cloaca theory'), while he now knows that there are two separate cavities and orifices. A reversed representation.[1]

(10)
OVERCOAT OR CLOAK AS SYMBOL

In women's dreams an overcoat or cloak [German '*Mantel*'] is unquestionably shown to be a symbol for a man. Linguistic assonance may perhaps play some part in this.[2] [196]

(13)
DISGRACED FEET (SHOES)

After several days of resistance the patient reported that she had felt very much snubbed because a young man whom she met regularly near the doctor's house, and who used as a rule to look at her admiringly, had on the last occasion looked contemptuously at her feet. In fact she had no reason to be ashamed of her feet. She produced the explanation herself after admitting that she had regarded the young man as the doctor's son,

1 [This and the next item are included in Chapter VI (E) of *The Interpretation of Dreams*, *RSE*, **5**, 317–18.]

2 [This is further discussed in Lecture XXIX of the *New Introductory Lectures* (1933*a*), ibid., **22**, 22.]

who thus (by way of the transference [*Übertragung*][T]) stood for her elder brother. There now followed a memory of having been in the habit of accompanying her brother to the lavatory when she was about five years old and of watching him micturate. She was overcome with envy at not being able to do it in the same way as he did and one day tried to copy him (envy for the penis). But in doing so she wetted her shoes and got very angry when her brother teased her about it. For a long time afterwards her anger recurred whenever her brother looked contemptuously at her shoes with the object of reminding her of her misfortune. She added that this experience had determined her later behaviour at school. If she was unsuccessful in anything at the first attempt she could never bring herself to try again, so that in many subjects she failed completely. – This is a good example of the way in which sexual life acts as a model and influences character.

(15)
SELF-CRITICISM BY NEUROTICS

It is always a striking thing and deserves special notice when a neurotic is
[197] in the habit of speaking ill of himself, expressing a low opinion of himself, and so on. As in the case of self-reproaches, it is often possible to explain it by supposing that he is identifying himself with someone else. But in one patient the attendant circumstances during the session necessitated another explanation of behaviour of this kind. A young lady, who never tired of declaring that she had very little intelligence, was without gifts, etc., was only trying to indicate by this that she had great physical beauty, and was concealing this boast behind her self-criticism. Nor was a reference to the harmful effects of masturbation – a reference which is to be expected in all such cases – absent in this one.

(19)
CONSIDERATIONS OF REPRESENTABILITY

A man dreamt that he was pulling a woman out from behind a bed: i.e. he was giving her preference.[1] – He (an officer) was sitting at a table opposite the Emperor: i.e. he was putting himself in opposition to the Emperor (his father). In both these cases the dreamer himself gave the
Übersetzung translation [*übersetzt*][T].[2]

1 [The point depends on a similarity between the German word for 'pulling out' ('*hervorziehen*') and 'giving preference' ('*vorziehen*').]

2 [These two examples are included in Chapter VI (F) of *The Interpretation of Dreams*, *RSE*, **5**, 365.]

(20)
DREAMS ABOUT DEAD PEOPLE

If someone dreams of talking to dead people or associating with them, and so on, this often has the meaning of his own death. But if he remembers in his dream that the person in question is dead, the dreamer is repudiating the fact that it signifies his own death.[1]

(21)
FRAGMENTARY DREAMS

These often contain only the symbols relating to the subject of the dream. For instance, here is a dream that occurred in a context of homosexual impulses [*Regungen*][T]: he was going for a walk somewhere with a friend . . . (indistinct) . . . balloons. [198]

(22)
APPEARANCE IN THE DREAM OF THE SYMPTOMS OF THE ILLNESS

The symptoms of the illness (anxiety [*Angst*][T], etc.), when they appear in a dream, seem generally speaking to mean: 'I fell ill because of this (i.e. in connection with the earlier elements of the dream).' Such dreams, accordingly, correspond to a continuation of the analysis in the dream.

1 [This point is included in Chapter VI (G) of *The Interpretation of Dreams*, *RSE*, **5**, 384 f.]

FAUSSE RECONNAISSANCE ('DÉJÀ RACONTÉ') IN PSYCHOANALYTIC TREATMENT

FAUSSE RECONNAISSANCE ('DÉJÀ RACONTÉ') IN PSYCHOANALYTIC TREATMENT

It not infrequently happens in the course of an analytic treatment that [201]
the patient, after reporting some fact that he has remembered, will go on to say: '*But I've told you that already*' – while the analyst himself feels sure that this is the first time he has heard the story. If the patient is contradicted upon the point, he will often protest with energy that he is perfectly certain he is right, that he is ready to swear to it, and so on; while the analyst's own conviction that what he has heard is new to him will become correspondingly stronger. To try to decide the dispute by shouting the patient down or by outvying him in protestations would be a most unpsychological proceeding. It is familiar ground that a sense of conviction of the accuracy of one's memory has no objective value; and, since one of the two persons concerned must necessarily be in the wrong, it may just as well be the physician as the patient who has fallen victim to a paramnesia. The analyst will admit as much to the patient, will break off the argument, and will postpone a settlement of the point until some later occasion.

In a minority of cases the analyst himself will then recollect that he has already heard the piece of information under dispute, and will at the same time discover the subjective, and often far-fetched, reason which led to this temporary forgetfulness. But in the great majority of cases it is the patient who turns out to have been mistaken; and he can be brought to recognize the fact. The explanation for this frequent occurrence appears to be that the patient really had an *intention* of giving this information, that once or even several times he actually made some remark leading up to it, but that he was then prevented by resistance from carrying out his purpose, and afterwards confused a recollection of his intention with a recollection of its performance.

Leaving on one side any cases in which there may still be some element [202]
of doubt, I will now bring forward a few others which are of special theoretical interest. With certain people it happens, and may even happen repeatedly, that they cling with particular obstinacy to the assertion that

they have already told the analyst this or that, when the nature of the circumstances and of the information in question makes it quite impossible that they can be right. For what they claim to have told the analyst already and what they claim to recognize as something old, which must be familiar to the analyst as well, turn out to be memories of the greatest importance to the analysis – confirmatory facts for which the analyst has long been waiting, or solutions which wind up a whole section of the work and which he would certainly have made the basis of an exhaustive discussion. In the face of these considerations the patient himself soon admits that his recollection must have deceived him, though he is unable to account for its definite character.

The phenomenon presented by the patient in cases like this deserves to be called a '*fausse reconnaissance*', and is completely analogous to what occurs in certain other cases and has been described as a '*déjà vu*'. In these other cases the subject has a spontaneous feeling such as 'I've been in this situation before', or 'I've been through all this already', without ever being in a position to confirm his conviction by discovering an actual recollection of the previous occasion. This latter phenomenon, as is well known, has provoked a large number of attempts at explanation, which can be divided roughly into two groups.[1] One class of explanation looks upon the feeling which constitutes the phenomenon as deserving of credence, and assumes that something really has been remembered – the only question being what. The second and far larger class of explanation includes those which maintain, on the contrary, that what we have to deal with is an illusory memory, and that the problem is to discover how this paramnesic error can have arisen. This latter group comprises many widely different hypotheses. There is, for instance, the ancient view, ascribed to Pythagoras, that the phenomenon of *déjà vu* is
[203] evidence of the subject having had a former life; again, there is the hypothesis based on anatomy (put forward by Wigan in 1860)[2] to the effect that the phenomenon is based on an absence of simultaneity in the functioning of the two cerebral hemispheres; and finally there are the purely psychological theories, supported by the majority of more recent authorities, which regard the *déjà vu* as an indication of an apperceptive weakness, and assign the responsibility for its occurrence to such causes as fatigue, exhaustion and distraction.

In 1904 Grasset put forward an explanation of the *déjà vu* which must

1 One of the most recent bibliographies of the subject is to be found in Havelock Ellis (1911*d*).

2 [Cf. Wigan, *The Duality of the Mind*, first published in 1844, p. 84 f. Wigan calls the phenomenon the 'sentiment of pre-existence' (a phrase which he derives from Sir Walter Scott).]

be reckoned as one of the group which 'believes' in the phenomenon. He was of the opinion that the phenomenon indicates that at some earlier time there has been an *unconscious* perception, which only now makes its way into consciousness under the influence of a new and similar impression. Several other authorities have agreed with this view, and have maintained that the basis of the phenomenon is the recollection of something that has been dreamt and then forgotten. In both cases it would be a question of the activation of an unconscious impression.

In 1907, in the second edition of my *Psychopathology of Everyday Life* [1901*b*, Chapter XII (D); *RSE*, **6**, 227–30], I proposed a very similar explanation for this form of apparent paramnesia without mentioning Grasset's paper or knowing of its existence. By way of excuse I may remark that I arrived at my conclusion as the result of a psychoanalytic investigation which I was able to make of an example of *déjà vu* in a female patient; it was extremely clear, although it had taken place some 28[I] years earlier. I shall not reproduce the little analysis in this place. It showed that the situation in which the *déjà vu* occurred was really calculated to revive the memory of an earlier experience of the patient's. The patient, who was at that time a twelve-year-old child, was visiting a family in which there was a brother who was seriously ill and at the point of death; while her own brother had been in a similarly dangerous condition a few months earlier. But with the earlier of these two similar events there had been associated a phantasy [*Phantasie*][T] that was incapable of entering consciousness – namely, a wish that her brother should die. [204]
Consequently, the analogy between the two cases could not become conscious. And the perception of it was replaced with the phenomenon of 'having been through it all before', the identity being displaced [*verschob*][T] from the really common element on to the locality. *Verschiebung*

The name '*déjà vu*' is, as we know, applied to a whole class of analogous phenomena, such as the '*déjà entendu*', the '*déjà éprouvé*' and the '*déjà senti*'. The case which I am now about to report, as a single instance out of many similar ones, consists of a '*déjà raconté*'; and it could be traced back to an unconscious resolution which was never carried out.

A patient[2] said to me in the course of his associations [*Assoziationen*][T]: 'When I was playing in the garden with a knife (that was when I was five years old) and cut through my little finger – oh, I only *thought* it was cut through – but I've told you about that already.'

1 [This is probably a misprint in the German text for '25' (see the account given in *The Psychopathology of Everyday Life*).]

2 [This patient was the 'Wolf Man', whose case history is reported in Freud, 1918*b*, where the next paragraph but one is quoted in full near the end of Section VII; *RSE*, **17**, 76–7.]

I assured him that I had no recollection of anything of the kind. He insisted with increasing conviction that it was impossible he could be mistaken. I finally put an end to the argument in the manner I have described above and asked him in any case to repeat the story. Then we should see where we were.

'When I was five years old, I was playing in the garden near my nurse, and was carving with my pocket-knife in the bark of one of the walnut trees that come into my dream as well.[1] Suddenly, to my unspeakable terror, I noticed that I had cut through the little finger of my (right or left?) hand, so that it was only hanging on by its skin. I felt no pain, but great fear. I did not venture to say anything to my nurse, who was only a few paces distant, but I sank down on the nearest seat and sat there
[205] incapable of casting another glance at my finger. At last I calmed down, took a look at the finger, and saw that it was entirely uninjured.'

We soon agreed that, in spite of what he had thought, he could not have told me the story of this vision or hallucination before. He was very well aware that I could not have failed to exploit such evidence as this of his having had a *fear of castration* at the age of five. The episode broke down his resistance to assuming the existence of a castration complex; but he raised the question: 'Why did I feel so certain of having told you this recollection before?'

It then occurred to both of us that repeatedly and in various connections he had brought out the following trivial recollection, and each time without our deriving any profit from it:

'Once when my uncle went away on a journey he asked me and my sister what we should like him to bring us back. My sister asked for a book, and I asked for a pocket-knife.' We now understood that this association [*Einfall*]^{T} which had emerged months before had in reality been
Verdrängung a screen memory [*Deckerinnerung*]^{T} for the repressed [*verdrängte*]^{T} recollection, and had been an attempt (rendered abortive by resistance) at telling the story of his imagined loss of his little finger – an unmistakable equivalent for his penis. The knife which his uncle did in fact bring him back was, as he clearly remembered, the same one that made its appearance in the episode which had been suppressed for so long.

It seems unnecessary to add anything in the way of an interpretation of this little occurrence, so far as it throws light upon the phenomenon

1 Cf. 'The Occurrence in Dreams of Material from Fairy Tales' [1913*d*; *RSE*, **12**, 281 f.]. In telling the story again on a later occasion he made the following correction: 'I don't believe I was cutting the tree. That was a confusion with another recollection, which must also have been hallucinatorily falsified, of having made a cut in a tree with my knife and of *blood* having come out of the tree.'

of '*fausse reconnaissance*'. As regards the subject matter of the patient's vision, I may remark that, particularly in relation to the castration complex, similar hallucinatory falsifications are of not infrequent occurrence, and that they can just as easily serve the purpose of correcting unwelcome perceptions.

In 1911 a man of university education, residing in a university town in Germany, with whom I am unacquainted and whose age is unknown to me, put the following notes upon his childhood at my disposal.

'In the course of reading your study on Leonardo da Vinci [1910*c*; *RSE*, **11**, 87 ff.], I was moved to internal dissent by the observations near the beginning of Chapter III. Your assertion that male children are [206] dominated by an interest in their own genitals provoked me to make a counterassertion to the effect that "if that is the general rule, I at all events am an exception to it". I then went on to read the passage that follows with the utmost amazement, such amazement as one feels when one comes across a fact of an entirely novel character. In the midst of my amazement a recollection occurred to me which showed me, to my own surprise, that the fact could not be by any means so novel as it had seemed. For, at the time at which I was passing through the period of "infantile sexual researches", a lucky chance gave me an opportunity of inspecting the female genitals in a little girl of my own age, and in doing so *I quite clearly observed a penis of the same kind as my own*. Soon afterwards I was plunged into fresh confusion by the sight of some female statues and nudes; and in order to get over this "scientific" discrepancy I devised the following experiment. By pressing my thighs together I succeeded in making my genitals disappear between them; and I was glad to find that in that way all differences between my own appearance and that of a female nude could be got rid of. Evidently, I thought to myself, the genitals have been made to disappear in a similar way in female nudes.

'At this point another recollection occurred to me, which has always been of the greatest importance to me, insofar as it is *one* of the three recollections which constitute all that I can remember of my mother, who died when I was very young. I remember seeing my mother standing in front of the washing stand and cleaning the glasses and washing basin, while I was playing in the same room and committing some misdemeanour. As a punishment my hand was soundly slapped. Then to my very great terror I saw my little finger fall off; and in fact it fell into the pail. Knowing that my mother was angry, I did not venture to say anything; but my terror grew still more intense when I saw the pail

carried off soon afterwards by the servant girl. For a long time I was convinced that I had lost a finger – up to the time, I believe, at which I learnt to count.

'I have often tried to interpret this recollection, which, as I have already mentioned, has always been of the greatest importance to me on account of its connection with my mother; but none of my interpretations has
[207] satisfied me. It is only now, after reading your book, that I begin to have a suspicion of a simple and satisfying answer to the conundrum.'

There is another kind of *fausse reconnaissance* which not infrequently makes its appearance at the close of a treatment, much to the physician's satisfaction. After he has succeeded in forcing the repressed event (whether it was of a real or of a psychical nature) upon the patient's acceptance in the teeth of all resistances, and has succeeded, as it were, in rehabilitating it – the patient may say: '*Now I feel as though I had known it all the time*.' With this the work of the analysis has been completed.[1]

1 [A short mention of a special case of *déjà vu* in dreams, with a different explanation, can be found in Chapter VI (E) of *The Interpretation of Dreams* (*RSE*, **5**, 357). The allied phenomena of 'derealization' and 'depersonalization' were examined by Freud in his paper on 'A Disturbance of Memory on the Acropolis' (1936*a*), ibid., **22**, 259–61. Cf. also a discussion in his late paper 'Constructions in Analysis' (1937*d*), ibid., **23**, 241 f.]

Freud's interest in Michelangelo's statue was of old standing. He went to see it on the fourth day of his very first visit to Rome in September, 1901, as well as on many later occasions. He was already planning the present paper in 1912, and on September 25 he wrote from Rome to his wife: 'I . . . pay a visit every day to the Moses in S. Pietro in Vincoli, about which I may perhaps write a few words.' (Freud, 1960*a*.) But it was

not written until the autumn of 1913. Many years later, referring to the paper in a letter of April 12, 1933, to Edoardo Weiss, Freud wrote: 'Every day for three lonely weeks of September, 1913 [a slip for 1912], I stood in the church in front of the statue, studying it, measuring it and drawing it until there dawned on me that understanding which I expressed in my essay, though I only dared to do so anonymously. It was only much later that I legitimized this non-analytical child.' (1960*a*.) An account of his long hesitations over its publication and of his final decision to have it printed anonymously can be found in the second volume of Ernest Jones's (1955) biography of Freud. The paper appeared in *Imago* as 'by ***', and the disguise was not lifted until 1924. See the insightful study by Grubrich-Simitis (2004) for further biographical details.

THE MOSES OF MICHELANGELO[1]

I may say at once that I am no connoisseur in art, but simply a lay- [211]
man. I have often observed that the subject matter of works of art has a stronger attraction for me than their formal and technical qualities, though to the artist their value lies first and foremost in these latter. I am unable rightly to appreciate many of the methods used and the effects obtained in art. I state this so as to secure the reader's indulgence for the attempt I propose to make here.

Nevertheless, works of art do exercise a powerful effect on me, especially those of literature and sculpture, less often of painting. This has occasioned me, when I have been contemplating such things, to spend a long time before them trying to apprehend them in my own way, i.e. to explain to myself what their effect is due to. Wherever I cannot do this, as for instance with music, I am almost incapable of obtaining any pleasure. Some rationalistic, or perhaps analytic, turn of mind in me rebels against being moved by a thing without knowing why I am thus affected and what it is that affects me.

This has brought me to recognize the apparently paradoxical fact that precisely some of the grandest and most overwhelming creations of art are still unsolved riddles to our understanding. We admire them, we feel overawed by them, but we are unable to say what they represent to us. I am not sufficiently well read to know whether this fact has already been remarked upon; possibly, indeed, some writer on aesthetics has dis- [212]
covered that this state of intellectual bewilderment is a necessary condition when a work of art is to achieve its greatest effects. It would be only with the greatest reluctance that I could bring myself to believe in any such necessity.

1 [The following footnote, drafted by Freud himself (Grubrich-Simitis, 1993, 223 f.; trans., 175), was attached to the title when the paper made its first, anonymous, appearance in *Imago*:

'Although this paper does not, strictly speaking, conform to the conditions under which contributions are accepted for publication in this Journal, the editors have decided to print it, since the author, who is personally known to them, moves in psychoanalytic circles, and since his mode of thought has in point of fact a certain resemblance to the methodology of psychoanalysis.']

I do not mean that connoisseurs and lovers of art find no words with which to praise such objects to us. They are eloquent enough, it seems to me. But usually in the presence of a great work of art each says something different from the other; and none of them says anything that solves the problem for the unpretending admirer. In my opinion, what grips us so powerfully can only be the artist's *intention*, insofar as he has succeeded in expressing it in his work and in getting us to understand it. I realize that this cannot be merely a matter of *intellectual* comprehension; what he aims at is to awaken in us the same emotional attitude, the same mental constellation as that which in him produced the impetus to create. But why should the artist's intention not be capable of being communicated
Seele and comprehended in *words*, like any other fact of mental [*seelischen*]^{T} life? Perhaps where great works of art are concerned this would never be possible without the application of psychoanalysis. The product itself after all must admit of such an analysis, if it really is an effective expression of the intentions and emotional activities of the artist. To discover his intention, though, I must first find out the meaning and content of what is represented in his work; I must, in other words, be able to *inter-*
Deutung *pret* [*deuten*]^{T} it. It is possible, therefore, that a work of art of this kind needs interpretation, and that until I have accomplished that interpretation I cannot come to know why I have been so powerfully affected. I even venture to hope that the effect of the work will undergo no diminution after we have succeeded in thus analysing it.

Let us consider Shakespeare's masterpiece, *Hamlet*, a play now over three centuries old.[1] I have followed the literature of psychoanalysis closely, and I accept its claim that it was not until the material of the tragedy had been traced back by psychoanalysis to the Oedipus theme that the mystery of its effect was at last explained. [Cf. *The Interpretation of Dreams*, *RSE*, **4**, 234–6.] But before this was done, what a mass of dif-
[213] fering and contradictory interpretative attempts, what a variety of opinions about the hero's character and the dramatist's intentions! Does Shakespeare claim our sympathies on behalf of a sick man, or of an ineffectual weakling, or of an idealist who is merely too good for the real world? And how many of these interpretations leave us cold! – so cold that they do nothing to explain the effect of the play and rather incline us to the view that its magical appeal rests solely upon the impressive thoughts in it and the splendour of its language. And yet, do not those very endeavours speak for the fact that we feel the need of discovering in it some source of power beyond them alone?

1 Perhaps first performed in 1602.

Another of these inscrutable and wonderful works of art is the marble statue of Moses, by Michelangelo, in the Church of S. Pietro in Vincoli in Rome. As we know, it was only a fragment of the gigantic tomb which the artist was to have erected for the powerful Pope Julius II.[1] It always delights me to read an appreciative sentence about this statue, such as that it is 'the crown of modern sculpture' (Grimm [1900, 189]). For no piece of statuary has ever made a stronger impression on me than this. How often have I mounted the steep steps from the unlovely Corso Cavour to the lonely piazza where the deserted church stands, and have essayed to support the angry scorn of the hero's glance! Sometimes I have crept cautiously out of the half-gloom of the interior as though I myself belonged to the mob upon whom his eye is turned – the mob which can hold fast no conviction, which has neither faith nor patience, and which rejoices when it has regained its illusory idols.

But why do I call this statue inscrutable? There is not the slightest doubt that it represents Moses, the lawgiver of the Jews, holding the Tables of the Ten Commandments. That much is certain, but that is all. As recently as 1912 an art critic, Max Sauerlandt, has said, 'No other work of art in the world has been judged so diversely as the Moses with the head of Pan. The mere interpretation of the figure has given rise to completely opposed views. . . .' Basing myself on an essay published only five years ago,[2] I will first set out the doubts which are associated with this [214]
figure of Moses; and it will not be difficult to show that behind them lies concealed all that is most essential and valuable for the comprehension of this work of art.

I

The Moses of Michelangelo is represented as seated; his body faces forward, his head with its mighty beard looks to the left, his right foot rests on the ground and his left leg is raised so that only the toes touch the ground. His right arm links the Tables of the Law with a portion of his beard; his left arm lies in his lap.[3] Were I to give a more detailed description of his attitude, I should have to anticipate what I want to say later on. The descriptions of the figure given by various writers are, by the way, curiously inapt. What has not been understood has been inaccurately perceived or reproduced. Grimm [1900, 189] says that the right

1 According to Henry Thode [1908, 194], the statue was made between the years 1512 and 1516.

2 Thode (1908).

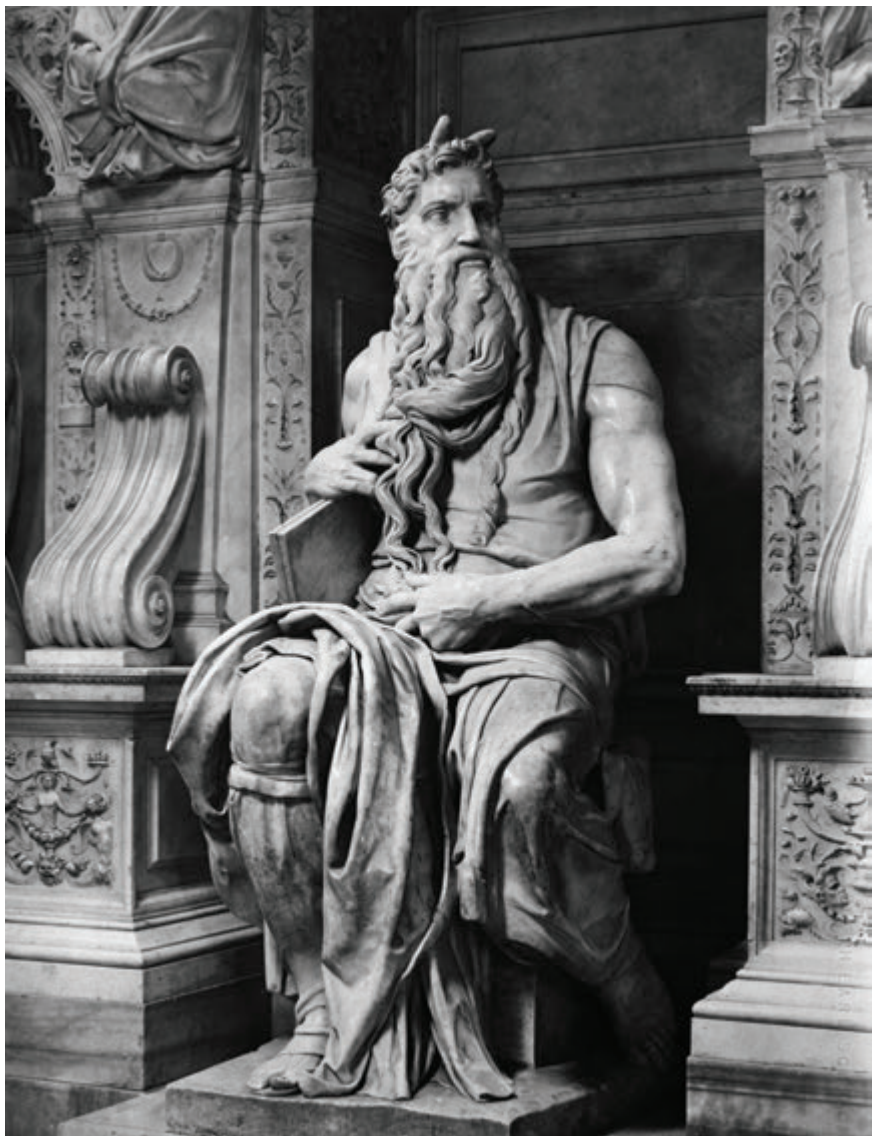
3 [See the illustration facing p. 208.]

hand, 'under whose arm the Tables rest, grasps his beard'. So also Lübke [1863, 666]: 'Profoundly shaken, he grasps with his right hand his magnificent, flowing beard . . .'; and Springer [1895, 33]: 'Moses presses one (the left) hand against his body, and thrusts the other, as though unconsciously, into the mighty locks of his beard.' Justi [1900, 326] thinks that the fingers of his (right) hand are playing with his beard, 'as an agitated man nowadays might play with his watch-chain'. Müntz [1895, 391 *n.*], too, lays stress on this playing with the beard. Thode [1908, 205] speaks of the 'calm, firm posture of the right hand upon the Tables resting against his side'. He does not recognize any sign of excitement even in the right hand, as Justi and also Boito [1883] do. 'The hand remains grasping his beard, in the position it was in before the Titan turned his head to one side.' Jakob Burckhardt [1927, 634] complains that 'the celebrated left arm has no other function in reality than to press his beard to his body'.

If mere descriptions do not agree we shall not be surprised to find a divergence of view as to the meaning of various features of the statue. In my opinion we cannot better characterize the facial expression of Moses than in the words of Thode [1908, 205], who reads in it 'a mixture of wrath, pain and contempt' – 'wrath in his threatening contracted brows,
[215] pain in his glance, and contempt in his protruded under-lip and in the down-drawn corners of his mouth'. But other admirers must have seen with other eyes. Thus Dupaty says, 'His august brow seems to be but a transparent veil only half concealing his great mind'.[1] Lübke [1863, 666–7], on the other hand, declares that 'one would look in vain in that head for an expression of higher intelligence; his down-drawn brow speaks of nothing but a capacity for infinite wrath and an all-compelling energy'. Guillaume (1876, [96]) differs still more widely in his interpretation of the expression of the face. He finds no emotion in it 'only a proud simplicity, an inspired dignity, a living faith. The eye of Moses looks into the future, he foresees the lasting survival of his people, the immutability of his law.' Similarly, to Müntz [1895, 391], 'the eyes of Moses rove far beyond the race of men. They are turned towards those mysteries which he alone has descried.' To Steinmann [1899, 169], indeed, this Moses is 'no longer the stern lawgiver, no longer the terrible enemy of sin, armed with the wrath of Jehovah, but the royal priest, whom age may not approach, beneficent and prophetic, with the reflection of eternity upon his brow, taking his last farewell of his people'.

There have even been some for whom the Moses of Michelangelo had

1 Quoted by Thode, 1908, 197.



Michelangelo's 'Moses'

Michelangelo's 'Moses'

In a letter to Edoardo Weiss dated April 12, 1933, Freud wrote: 'My relationship to this work is something like that to a love-child. Every day for three lonely weeks in September of 1913 I stood in the church in front of the statue, studying it, measuring and drawing it until there dawned on me that understanding which in the essay I only dared to express anonymously. Not until much later did I legitimize this nonanalytical child.'

Bettmann via Getty Images.

nothing at all to say, and who are honest enough to admit it. Thus a critic in the *Quarterly Review* of 1858 [**103**, 469]: 'There is an absence of meaning in the general conception, which precludes the idea of a self-sufficing whole. . . .' And we are astonished to learn that there are yet others who find nothing to admire in the Moses, but who revolt against it and complain of the brutality of the figure and the animal cast of the head.

Has then the master-hand indeed traced such a vague or ambiguous script in the stone, that so many different readings of it are possible?

Another question, however, arises, which covers the first one. Did Michelangelo intend to create a 'timeless study of character and mood' in this Moses, or did he portray him at a particular moment of his life and, if so, at a highly significant one? The majority of judges have decided in the latter sense and are able to tell us what episode in his life it is which [216] the artist has immortalized in stone. It is the descent from Mount Sinai, where Moses has received the Tables from God, and it is the moment when he perceives that the people have meanwhile made themselves a Golden Calf and are dancing around it and rejoicing. This is the scene upon which his eyes are turned, this is the spectacle which calls out the feelings depicted in his countenance – feelings which in the next instant will launch his great frame into violent action. Michelangelo has chosen this last moment of hesitation, of calm before the storm, for his representation. In the next instant Moses will spring to his feet – his left foot is already raised from the ground – dash the Tables to the earth, and let loose his rage upon his faithless people.

Once more many individual differences of opinion exist among those who support this interpretation.

Burckhardt [1927, 634] writes: 'Moses seems to be shown at that moment at which he catches sight of the worship of the Golden Calf, and is springing to his feet. His form is animated by the inception of a mighty movement and the physical strength with which he is endowed causes us to await it with fear and trembling.'

Lübke [1863, 666] says: 'It is as if at this moment his flashing eye were perceiving the sin of the worship of the Golden Calf and a mighty inward movement were running through his whole frame. Profoundly shaken, he grasps with his right hand his magnificent, flowing beard, as though to master his actions for one instant longer, only for the explosion of his wrath to burst out with more shattering force the next.'

Springer [1895, 33] agrees with this view, but not without mentioning one misgiving, which will engage our attention later in this paper. He says, 'Burning with energy and zeal, it is with difficulty that the hero

subdues his inward emotion. . . . We are thus involuntarily reminded of a dramatic situation and are brought to believe that Moses is represented at the moment at which he sees the people of Israel worshipping the Golden Calf and is about to start up in wrath. Such an impression, it is true, is not easy to reconcile with the artist's real intention, since the figure of Moses, like the other five seated figures on the upper part of the
[217] Papal tomb, is meant primarily to have a decorative effect. But it testifies very convincingly to the vitality and individuality portrayed in the figure of Moses.'

One or two writers, without actually accepting the Golden Calf theory, do nevertheless agree on its main point, namely, that Moses is just about to spring to his feet and take action.

According to Grimm [1900, 189], 'The form' (of Moses) 'is filled with a majesty, a self-assurance, a feeling that all the thunders of heaven are at his command, and that yet he is holding himself in check before loosing them, waiting to see whether the foes whom he means to annihilate will dare to attack him. He sits there as if on the point of starting to his feet, his proud head carried high on his shoulders; the hand under whose arm the Tables rest grasps his beard, which falls in heavy waves over his breast, his nostrils distended and his lips shaped as though words were trembling upon them.'

Heath Wilson [1876, 450] declares that Moses' attention has been excited, and he is about to leap to his feet, but is still hesitating; and that his glance of mingled scorn and indignation is still capable of changing into one of compassion.

Wölfflin [1899, 72] speaks of 'inhibited movement'. The cause of this inhibition, he says, lies in the will of the man himself; it is the last moment of self-control before he lets himself go and leaps to his feet.

Justi [1900, 326–7] has gone the furthest of all in his interpretation of the statue as Moses in the act of perceiving the Golden Calf, and he has pointed out details hitherto unobserved in it and worked them into his hypothesis. He directs our attention to the position of the two Tables – an unusual one, for they are about to slip down on to the stone seat. 'He' (Moses) 'might therefore be looking in the direction from which the clamour was coming with an expression of evil foreboding, or it might be the actual sight of the abomination which has dealt him a stunning blow. Quivering with horror and pain he has sunk down.[1] He has

1 It should be remarked that the careful arrangement of the mantle over the knees of the sitting figure invalidates this first part of Justi's view. On the contrary, this would lead us to suppose that Moses is represented as sitting there in calm repose until he is startled by some sudden perception.

sojourned on the mountain forty days and nights and he is weary. A horror, a great turn of fortune, a crime, even happiness itself, can be perceived in a single moment, but not grasped in its essence, its depths or its consequences. For an instant it seems to Moses that his work is destroyed and he despairs utterly of his people. In such moments the inner emotions betray themselves involuntarily in small movements. He lets the Tables slip from his right hand on to the stone seat; they have come to rest on their corner there and are pressed by his forearm against the side of his body. His hand, however, comes in contact with his breast and beard and thus, by the turning of the head to the spectator's right, it draws the beard to the left and breaks the symmetry of that masculine adornment. It looks as though his fingers were playing with his beard as an agitated man nowadays might play with his watch-chain. His left hand is buried in his garment over the lower part of his body – in the Old Testament the viscera are the seat of the emotions – but the left leg is already drawn back and the right put forward; in the next instant he will leap up, his mental energy will be transposed from feeling into action, his right arm will move, the Tables will fall to the ground, and the shameful trespass will be expiated in torrents of blood. . . .' 'This is not yet the moment of tension of an act. Pain of mind still dominates him and almost paralyses him.' [218]

Knapp [1906, xxxii] takes the same view, except that he does not introduce the doubtful point at the beginning of the description,[1] and carries the idea of the slipping Tables further. 'He who just now was alone with his God is distracted by earthly sounds. He hears a noise; the noise of singing and dancing wakes him from his dream; he turns his eyes and his head in the direction of the clamour. In one instant fear, rage and unbridled passion traverse his huge frame. The Tables begin to slip down, and will fall to the ground and break when he leaps to his feet and hurls the angry thunder of his words into the midst of his backsliding people. . . . This is the moment of highest tension which is chosen. . . .' Knapp, therefore, emphasizes the element of preparation for action, and disagrees with the view that what is being represented is an initial inhibition due to an overmastering agitation.

It cannot be denied that there is something extraordinarily attractive about attempts at an interpretation of the kind made by Justi and Knapp. This is because they do not stop short at the general effect of the figure, but are based on separate features in it; these we usually fail to notice, being overcome by the total impression of the statue and as it were [219]

1 [Cf. footnote, p. 210 above.]

paralysed by it. The marked turn of the head and eyes to the left, whereas the body faces forwards, supports the view that the resting Moses has suddenly seen something on that side to rivet his attention. His lifted foot can hardly mean anything else but that he is preparing to spring up;[1] and the very unusual way in which the Tables are held (for they are most sacred objects and are not to be brought into the composition like any ordinary accessory) is fully accounted for if we suppose they have slipped down as a result of the agitation of their bearer and will fall to the ground. According to this view we should believe that the statue represents a special and important moment in the life of Moses, and we should be left in no doubt of what that moment is.

But two remarks of Thode's deprive us of the knowledge we thought to have gained. This critic says that to his eye the Tables are not slipping down but are 'firmly lodged'. He notes the 'calm, firm pose of the right hand upon the resting Tables'. If we look for ourselves we cannot but admit unreservedly that Thode is right. The Tables are firmly placed and in no danger of slipping. Moses' right hand supports them or is supported by them. This does not explain the position in which they are held, it is true, but that position cannot be used in favour of the interpretation of Justi and others. [Thode (1908), 205.]

The second observation is still more final. Thode reminds us that 'this statue was planned as one of six, and is intended to be seated. Both facts contradict the view that Michelangelo meant to record a particular historical moment. For, as regards the first consideration, the plan of representing a row of seated figures as types of human beings – as the *vita activa* and the *vita contemplativa* – excluded a representation of a particular historic episode. And, as regards the second, the representation
[220] of a seated posture – a posture necessitated by the artistic conception of the whole monument – contradicts the nature of that episode, namely, the descent of Moses from Mount Sinai into the camp.'

If we accept Thode's objection we shall find that we can add to its weight. The figure of Moses was to have decorated the base of the tomb together with five other statues (or, according to a later sketch, with three). Its immediate counterpart was to have been a figure of Paul. One other pair, representing the *vita activa* and the *vita contemplativa* in the shape of Leah and Rachel – standing, it is true – has been executed on the tomb as it still exists in its sadly aborted form. The Moses thus forms part of a whole and we cannot imagine that the figure was meant to arouse an

1 Although the left foot of the reposeful seated figure of Giuliano in the Medici Chapel is similarly raised from the ground.

expectation in the spectator that it was on the point of leaping up from its seat and rushing away to create a disturbance on its own account. If the other figures were not also represented as about to take violent action – and it seems very improbable that they were – then it would create a very bad impression for one of them to give us the illusion that it was going to leave its place and its companions, in fact to abandon its role in the general scheme. Such an intention would have a chaotic effect and we could not charge a great artist with it unless the facts drove us to it. A figure in the act of instant departure would be utterly at variance with the state of mind which the tomb is meant to induce in us.

The figure of Moses, therefore, cannot be supposed to be springing to his feet; he must be allowed to remain as he is in sublime repose like the other figures and like the proposed statue of the Pope (which was not, however, executed by Michelangelo himself). But then the statue we see before us cannot be that of a man filled with wrath, of Moses when he came down from Mount Sinai and found his people faithless and threw down the Holy Tables so that they were broken. And, indeed, I can recollect my own disillusionment when, during my first visits to San Pietro in Vincoli, I used to sit down in front of the statue in the expectation that I should now see how it would start up on its raised foot, dash the Tables of the Law to the ground and let fly its wrath. Nothing of the kind happened. Instead, the stone image became more and more transfixed, an almost oppressively solemn calm emanated from it, and I was obliged to realize that something was represented here that could stay without [221]
change; that this Moses would remain sitting like this in his wrath for ever.

But if we have to abandon our interpretation of the statue as showing Moses just before his outburst of wrath at the sight of the Golden Calf, we have no alternative but to accept one of the hypotheses which regard it as a study of character. Thode's view seems to be the least arbitrary and to have the closest reference to the meaning of its movements. He says, 'Here, as always, he [Michelangelo] is concerned with representing a certain type of character. He creates the image of a passionate leader of mankind who, conscious of his divine mission as lawgiver, meets the uncomprehending opposition of men. The only means of representing a man of action of this kind was to accentuate the power of his will, and this was done by a rendering of movement pervading the whole of his apparent quiet, as we see in the turn of his head, the tension of his muscles and the position of his left foot. These are the same distinguishing marks that we find again in the *vir activus* of the Medici Chapel in

Florence. This general character of the figure is further heightened by laying stress on the conflict which is bound to arise between such a reforming genius and the rest of mankind. Emotions of anger, contempt and pain are typified in him. Without them it would not have been possible to portray the nature of a superman of this kind. Michelangelo has created, not a historical figure, but a character-type, embodying an inexhaustible inner force which tames the recalcitrant world; and he has given a form not only to the biblical narrative of Moses, but to his own inner experiences, and to his impressions both of the individuality of Julius himself, and also, I believe, of the underlying springs of Savonarola's perpetual conflicts.' [1908, 206.]

This view may be brought into connection with Knackfuss's remark [1900, 69] that the great secret of the effect produced by the Moses lies in the artistic contrast between the inward fire and the outward calm of his bearing.

For myself, I see nothing to object to in Thode's explanation; but I feel the lack of something in it. Perhaps it is the need to discover a closer parallel between the state of mind of the hero as expressed in his attitude, and the contrast above-mentioned between his 'outward' calm and 'inward' emotion.

II

[222] Long before I had any opportunity of hearing about psychoanalysis, I learnt that a Russian art connoisseur, Ivan Lermolieff,[1] had caused a revolution in the art galleries of Europe by questioning the authorship of many pictures, showing how to distinguish copies from originals with certainty, and constructing hypothetical artists for those works whose former supposed authorship had been discredited. He achieved this by insisting that attention should be diverted from the general impression and main features of a picture, and by laying stress on the significance of minor details, of things like the drawing of the fingernails, of the lobe of an ear, of halos and such unconsidered trifles which the copyist neglects to imitate and yet which every artist executes in his own characteristic way. I was then greatly interested to learn that the Russian pseudonym concealed the identity of an Italian physician called Morelli, who died in 1891 with the rank of Senator of the Kingdom of Italy. It seems to me that his method of enquiry is closely related to the technique of psychoanalysis. It, too, is accustomed to divine secret and concealed things from

1 His first essays were published in German between 1874 and 1876.

despised or unnoticed features, from the rubbish heap, as it were, of our observations.

Now in two places in the figure of Moses there are certain details which have hitherto not only escaped notice but, in fact, have not even been properly described. These are the attitude of his right hand and the position of the two Tables of the Law. We may say that this hand forms a very singular, unnatural link, and one which calls for explanation, between the Tables and the wrathful hero's beard. He has been described as running his fingers through his beard and playing with its locks, while the outer edge of his hand rests on the Tables. But this is plainly not so. It is worthwhile examining more closely what those fingers of the right hand are doing, and describing more minutely the mighty beard with which they are in contact.[1]

We now quite clearly perceive the following things: the thumb of the hand is concealed and the index finger alone is in effective contact with the beard. It is pressed so deeply against the soft masses of hair that they [223]
bulge out beyond it both above and below, that is, both towards the head and towards the abdomen. The other three fingers are propped upon the wall of his chest and are bent at the upper joints; they are barely touched by the extreme right-hand lock of the beard which falls past them. They have, as it were, withdrawn from the beard. It is therefore not correct to say that the right hand is playing with the beard or plunged in it; the simple truth is that the index finger is laid over a part of the beard and makes a deep trough in it. It cannot be denied that to press one's beard with one finger is an extraordinary gesture and one not easy to understand.

The much-admired beard of Moses flows from his cheeks, chin and upper lip in a number of waving strands which are kept distinct from one another all the way down. One of the strands on his extreme right, growing from the cheek, falls down to the inward-pressing index finger, by which it is retained. We may assume that it resumes its course between that finger and the concealed thumb. The corresponding strand on his left side falls practically unimpeded far down over his breast. What has received the most unusual treatment is the thick mass of hair on the inside of this latter strand, the part between it and the middle line. It is not suffered to follow the turn of the head to the left; it is forced to roll over loosely and form part of a kind of scroll which lies across and over the strands on the inner right side of the beard. This is because it is held fast by the pressure of the right index finger, although it grows from the

1 Cf. the illustration [facing p. 216].

left side of the face and is, in fact, the main portion of the whole left side of the beard. Thus, the main mass of the beard is thrown to the right of the figure, whereas the head is sharply turned to the left. At the place where the right index finger is pressed in, a kind of whorl of hairs is formed; strands of hair coming from the left lie over strands coming from the right, both caught in by that despotic finger. It is only beyond this place that the masses of hair, deflected from their course, flow freely once more, and now they fall vertically until their ends are gathered up in Moses' left hand as it lies open on his lap.

[224] I have no illusions as to the clarity of my description, and venture no opinion whether the sculptor really does invite us to solve the riddle of that knot in the beard of his statue. But apart from this, the fact remains that the pressure of the *right* index finger affects mainly the strands of hair from the *left* side; and that this oblique hold prevents the beard from accompanying the turn of the head and eyes to the left. Now we may be allowed to ask what this arrangement means and to what motives it owes its existence. If it was indeed considerations of linear and spatial design which caused the sculptor to draw the downward-streaming wealth of hair across to the right of the figure which is looking to its left, how strangely unsuitable as a means does the pressure of a single finger appear to be! And what man who, for some reason or other, has drawn his beard over to the other side would take it into his head to hold down the one half across the other by the pressure of one finger? Yet may not these minute particulars mean nothing in reality, and may we not be racking our brains about things which were of no moment to their creator?

But let us proceed on the assumption that even these details have significance. There is a solution which will remove our difficulties and afford a glimpse of a new meaning. If the *left* side of Moses' beard lies under the pressure of his *right* finger, we may perhaps take this pose as the last stage of some connection between his right hand and the left half of his beard, a connection which was a much more intimate one at some moment before that chosen for representation. Perhaps his hand had seized his beard with far more energy, had reached across to its left edge, and, in returning to that position in which the statue shows it, had been followed by a part of his beard which now testifies to the movement which has just taken place. The loop of the beard would thus be an indication of the path taken by this hand.

Thus we shall have inferred that there had been a retreating motion of the right hand. This one assumption necessarily brings others with it. In imagination we complete the scene of which this movement, established

Detail of Michelangelo's 'Moses'

Detail of Michelangelo's 'Moses'

On p. 221 of this volume, Freud writes: 'What we see before us is not the inception of a violent action but the remains of a movement that has already taken place . . .'

DEA / G. Nimatallah via Getty Images.

by the evidence of the beard, is a part; and we are brought back quite naturally to the hypothesis according to which the resting Moses is startled by the clamour of the people and the spectacle of the Golden Calf. He was sitting there calmly, we will suppose, his head with its flowing beard facing forward, and his hand in all probability not near it at all. [225] Suddenly the clamour strikes his ear; he turns his head and eyes in the direction from which the disturbance comes, sees the scene and takes it in. Now wrath and indignation lay hold of him; and he would readily leap up and punish the wrongdoers, annihilate them. His rage, distant as yet from its object, is meanwhile directed in a gesture against his own body. His impatient hand, ready to act, clutches at his beard which has moved with the turn of his head, and presses it between his thumb and palm in the iron grasp of his closing fingers. It is a gesture whose power and vehemence remind us of other creations of Michelangelo's. But now an alteration takes place, as yet we do not know how or why. The hand that had been put forward and had sunk into his beard is hastily withdrawn and unclasped, and the fingers let go their hold; but so deeply have they been plunged in that in their withdrawal they drag a great piece of the left side of the beard across to the right, and this piece remains lodged over the hair of the right under the weight of one finger, the longest and uppermost one of the hand. And this new position, which can only be understood with reference to the former one, is now retained.

It is time now to pause and reflect. We have assumed that the right hand was, to begin with, away from the beard; that then it reached across to the left of the figure in a moment of great emotional tension and seized the beard; and that it was finally drawn back again, taking a part of the beard with it. We have disposed of this right hand as though we had the free use of it. But may we do this? Is the hand indeed so free? Must it not hold or support the Tables? Are not such mimetic evolutions as these prohibited by its important function? And furthermore, what could have occasioned its withdrawal if the motive which made it leave its original position was such a strong one?

Here are indeed fresh difficulties. It is undeniable that the right hand is responsible for the Tables; and also that we have no motive to account for the withdrawal we have ascribed to it. But what if both difficulties could be solved together, and if then and then only they presented a clear and connected sequence of events? What if it is precisely something which is happening to the Tables that explains the movements of the hand?

[226] If we look at the drawing in Fig. 4 we shall see that the Tables present one or two notable features hitherto not deemed worthy of remark. It has been said that the right hand rests upon the Tables; or again that it supports them. And we can see at once that the two apposed, rectangular tablets stand on one corner. If we look closer we shall notice that the lower edge is a different shape from the upper one, which is obliquely inclined forward.

Fig. 1

Fig. 2

The upper edge is straight, whereas the lower one has a protuberance like a horn on the part nearest to us, and the Tables touch the stone seat precisely with this protuberance. What can be the meaning of this detail?[1] It can hardly be doubted that this projection is meant to mark the actual top side of the Tables, as regards the writing. It is only the top edge of
[227] rectangular tablets of this kind that is curved or notched. Thus we see that the Tables are upside-down. This is a singular way to treat such sacred objects. They are stood on their heads and practically balanced on one corner. What consideration of form could have led Michelangelo to put them in such a position? Or was this detail as well of no importance to the artist?

We begin to suspect that the Tables too have arrived at their present position as the result of a previous movement; that this movement was a

1 Which, by the way, is quite incorrectly reproduced in a large plaster cast in the collection of the Vienna Academy of Fine Arts.

consequence of the change of place of the right hand that we have postulated, and in its turn compelled that hand to make its subsequent retreat. The movements of the hand and of the Tables can be coordinated in this way: at first the figure of Moses, while it was still sitting quietly, carried the Tables perpendicularly under its right arm. Its right hand grasped their lower edge and found a hold in the projection on their front part.

Fig. 3

Fig. 4

(The fact that this made them easier to carry sufficiently accounts for the upside-down position in which the Tables were held.) Then came the moment when Moses' calm was broken by the disturbance. He turned [228] his head in its direction, and when he saw the spectacle he lifted his foot preparatory to starting up, let go the Tables with his hand and plunged it to the left and upwards into his beard, as though to turn his violence against his own body. The Tables were now consigned to the pressure of his arm, which had to squeeze them against his side. But this support was not sufficient and the Tables began to slip in a forward and downward direction. The upper edge, which had been held horizontally, now began to face forwards and downwards; and the lower edge, deprived of its stay, was nearing the stone seat with its front corner. Another instant and the Tables would have pivoted upon this new point of support, have hit the ground with the upper edge foremost, and been shattered to pieces.

It is *to prevent this* that the right hand retreated, let go the beard, a part of which was drawn back with it unintentionally, came against the upper edge of the Tables in time and held them near the hind corner, which had now come uppermost. Thus the singularly constrained air of the whole – beard, hand and tilted Tables – can be traced to that one passionate movement of the hand and its natural consequences. If we wish to reverse the effects of those stormy movements, we must raise the upper front corner of the Tables and push it back, thus lifting their lower front corner (the one with the protuberance) from the stone seat; and then lower the right hand and bring it under the now horizontal lower edge of the Tables.

I have procured from the hand of an artist three drawings to illustrate my meaning.[1] Fig. 3 reproduces the statue as it actually is; Figs. 1 and 2 represent the preceding stages according to my hypothesis – the first that of calm, the second that of highest tension, in which the figure is preparing to spring up and has abandoned its hold of the Tables, so that these are beginning to slip down. Now it is remarkable how the two postures in the imaginary drawings vindicate the incorrect descriptions of earlier writers. Condivi, a contemporary of Michelangelo's, says: 'Moses, the captain and leader of the Hebrews, is seated in the attitude of a contemplative sage, holding the Tables of the Law under his right arm, and leaning his chin on his left hand(!), as one who is weary and full of care.'
[229] No such attitude is to be seen in Michelangelo's statue, but it describes almost exactly the view on which the first drawing is based. Lübke writes, together with other critics: 'Profoundly shaken, he grasps with his right hand his magnificent, flowing beard.' This is incorrect if we look at the reproduction of the actual statue, but it is true of the second sketch (Fig. 2). Justi and Knapp have observed, as we have seen, that the Tables are about to slip down and are in danger of being broken. Thode set them right and showed that the Tables were securely held by the right hand; yet they would have been correct if they had been describing not the statue itself but the middle stage of our reconstructed action. It almost seems as if they had emancipated themselves from the visual image of the statue and had unconsciously begun an analysis of its postural motives, and that that analysis had led them to make the same claim as we have done more consciously and more explicitly.

1 [Grubrich-Simitis (1993, 199 f.; trans., 153 f.) has identified another drawing of Michelangelo's statue among Freud's papers.]

III

We may now, I believe, permit ourselves to reap the fruits of our endeavours. We have seen how many of those who have felt the influence of this statue have been impelled to interpret it as representing Moses agitated by the spectacle of his people fallen from grace and dancing round an idol. But this interpretation had to be given up, for it made us expect to see him spring up in the next moment, break the Tables and accomplish the work of vengeance. Such a conception, however, would fail to harmonize with the design of making this figure, together with three (or five) more seated figures, a part of the tomb of Julius II. We may now take up again the abandoned interpretation, for the Moses we have reconstructed will neither leap up nor cast the Tables from him. What we see before us is not the inception of a violent action but the remains of a movement that has already taken place. In his first transport of fury, Moses desired to act, to spring up and take vengeance and forget the Tables; but he has overcome the temptation, and he will now remain seated and still, in his frozen wrath and in his pain mingled with contempt. Nor will he throw away the Tables so that they will break on the stones, for it is on their particular account that he has controlled his anger; it was to preserve them that he kept his passion in check. In giving [230] way to his rage and indignation, he had to neglect the Tables, and the hand which upheld them was withdrawn. They began to slide down and were in danger of being broken. This brought him to himself. He remembered his mission and for its sake renounced an indulgence of his feelings. His hand returned and saved the unsupported Tables before they had actually fallen to the ground. In this attitude he remained immobilized, and in this attitude Michelangelo has portrayed him as the guardian of the tomb.[1]

As our eyes travel down it the figure exhibits three distinct emotional strata. The lines of the face reflect the feelings which have won the ascendancy; the middle of the figure shows the traces of suppressed movement; and the foot still retains the attitude of the projected action. It is as though the controlling influence had proceeded downwards from above. No mention has been made so far of the left arm, and it

1 [It was suggested by Ernest Jones that Freud may have been partly drawn into making this analysis of the feelings depicted in Michelangelo's statue by his own attitude towards the dissident movements of Adler and Jung, which had so much occupied his mind during the period immediately preceding his composition of this paper. Grubrich-Simitis (2004) provides a comprehensive analysis of Freud's apparent identification with Moses. – Freud's interest in the *historical* figure of Moses was, of course, shown in his last published work, *Moses and Monotheism* (1939*a*), *RSE*, **23**, 9 ff.]

seems to claim a share in our interpretation. The hand is laid in the lap in a mild gesture and holds as though in a caress the end of the flowing beard. It seems as if it is meant to counteract the violence with which the other hand had misused the beard a few moments ago.

But here it will be objected that after all this is not the Moses of the Bible. For that Moses did actually fall into a fit of rage and did throw away the Tables and break them. This Moses must be a quite different man, a new Moses of the artist's conception; so that Michelangelo must have had the presumption to emend the sacred text and to falsify the character of that holy man. Can we think him capable of a boldness which might almost be said to approach an act of blasphemy?

The passage in the Holy Scriptures which describes Moses' action at
[231] the scene of the Golden Calf is as follows:[1] (*Exodus* xxxii. 7) 'And the Lord said unto Moses, Go, get thee down; for thy people, which thou broughtest out of the land of Egypt, have corrupted themselves: (8) They have turned aside quickly out of the way which I commanded them: they have made them a molten calf, and have worshipped it, and have sacrificed thereunto, and said, These be thy gods, O Israel, which brought thee up out of the land of Egypt. (9) And the Lord said unto Moses, I have seen this people, and, behold, it is a stiff-necked people: (10) Now therefore let me alone, that my wrath may wax hot against them, and that I may consume them; and I will make of thee a great nation. (11) And Moses besought the Lord his God, and said, Lord, why doth thy wrath wax hot against thy people, which thou hast brought forth out of the land of Egypt with great power, and with a mighty hand? . . .

'(14) And the Lord repented of the evil which he thought to do unto his people. (15) And Moses turned, and went down from the mount, and the two tables of the testimony were in his hand: the tables were written on both their sides; on the one side and on the other were they written. (16) And the tables were the work of God, and the writing was the writing of God, graven upon the tables. (17) And when Joshua heard the noise of the people as they shouted, he said unto Moses, There is a noise of war in the camp. (18) And he said, It is not the voice of them that shout for mastery, neither is it the voice of them that cry for being overcome; but the noise of them that sing do I hear. (19) And it came to pass, as soon as he came nigh unto the camp, that he saw the calf, and the dancing: and

1 [In the original, Freud apologizes for his 'anachronistic use of Luther's translation'. What follows is from the Authorized Version. – In a critical reconsideration of Freud's essay in the light of subsequent literature on Michelangelo's Moses, Grubrich-Simitis (2004) points out that the historical moment it represents is more likely that described in *Exodus* xxxiv – Moses' return from Mt. Sinai with a second set of Tables.]

Moses' anger waxed hot, and he cast the tables out of his hands, and brake them beneath the mount. (20) And he took the calf which they had made, and burnt it in the fire, and ground it to powder, and strawed it upon the water, and made the children of Israel drink of it. . . .

'(30) And it came to pass on the morrow, that Moses said unto the people, Ye have sinned a great sin: and now I will go up unto the Lord; peradventure I shall make an atonement for your sin. (31) And Moses returned unto the Lord, and said, Oh! this people have sinned a great sin, and have made them gods of gold! (32) Yet now, if thou wilt forgive their sin –; and if not, blot me, I pray thee, out of thy book which thou hast written. (33) And the Lord said unto Moses, Whosoever hath sinned [232]
against me, him will I blot out of my book. (34) Therefore now go, lead the people unto the place of which I have spoken unto thee. Behold, mine Angel shall go before thee: nevertheless, in the day when I visit, I will visit their sin upon them. (35) And the Lord plagued the people, because they made the calf which Aaron made.'

It is impossible to read the above passage in the light of modern criticism of the Bible without finding evidence that it has been clumsily put together from various sources. In verse 8 the Lord Himself tells Moses that his people have fallen away and made themselves an idol; and Moses intercedes for the wrongdoers. And yet he speaks to Joshua as though he knew nothing of this (18), and is suddenly aroused to wrath as he sees the scene of the worshipping of the Golden Calf (19). In verse 14 he has already gained a pardon from God for his erring people, yet in verse 31 he returns into the mountains to implore this forgiveness, tells God about his people's sin and is assured of the postponement of the punishment. Verse 35 speaks of a visitation of his people by the Lord about which nothing more is told us; whereas the verses 20–30 describe the punishment which Moses himself dealt out. It is well known that the historical parts of the Bible, dealing with the Exodus, are crowded with still more glaring incongruities and contradictions.

The age of the Renaissance had naturally no such critical attitude towards the text of the Bible, but had to accept it as a consistent whole, with the result that the passage in question was not a very good subject for representation. According to the Scriptures Moses was already instructed about the idolatry of his people and had ranged himself on the side of mildness and forgiveness; nevertheless, when he saw the Golden Calf and the dancing crowd, he was overcome by a sudden frenzy of rage. It would therefore not surprise us to find that the artist, in depicting the reaction of his hero to that painful surprise, had deviated from the

text from inner motives. Moreover, such deviations from the scriptural text on a much slighter pretext were by no means unusual or disallowed to artists. A celebrated picture by Parmigianino possessed by his native town depicts Moses sitting on the top of a mountain and dashing the
[233] Tables to the ground, although the Bible expressly says that he broke them 'beneath the mount'.[1] Even the representation of a seated Moses finds no support in the text and seems rather to bear out those critics who maintain that Michelangelo's statue is not meant to record any particular moment in the prophet's life.

More important than his infidelity to the text of the Scriptures is the alteration which Michelangelo has, in our supposition, made in the character of Moses. The Moses of legend and tradition had a hasty temper and was subject to fits of passion. It was in a transport of divine wrath of this kind that he slew an Egyptian who was maltreating an Israelite, and had to flee out of the land into the wilderness; and it was in a similar passion that he broke the Tables of the Law, inscribed by God Himself. Tradition, in recording such a characteristic, is unbiased, and preserves the impression of a great personality who once lived. But Michelangelo has placed a different Moses on the tomb of the Pope, one superior to the historical or traditional Moses. He has modified the theme of the broken Tables; he does not let Moses break them in his wrath, but makes him be influenced by the danger that they will be broken and makes him calm that wrath, or at any rate prevent it from becoming an act. In this way he has added something new and more than human to the figure of Moses; so that the giant frame with its tremendous physical power becomes only a concrete expression of the highest mental achievement that is possible in a man, that of struggling successfully against an inward passion for the sake of a cause to which he has devoted himself.

We have now completed our interpretation of Michelangelo's statue, though it can still be asked what motives prompted the sculptor to select the figure of Moses, and a so greatly altered Moses, as an adornment for the tomb of Julius II. In the opinion of many these motives are to be found in the character of the Pope and in Michelangelo's relations with him. Julius II was akin to Michelangelo in this, that he attempted to realize great and mighty ends, and especially designs on a grand scale. He

1 [The picture referred to here is without doubt Parmigianino's monochrome panel on the vaulting of the Chiesa della Steccata in Parma. As Professor Quentin Bell has pointed out, however, close inspection of the picture does not bear out the assumption that Moses is depicted on the top of a mountain. The nine studies for the Moses (cf. A. E. Popham, *The Drawings of Parmigianino*, London, 1953) suggest even more clearly that a generalized architectural setting for the figure was intended.]

was a man of action and he had a definite purpose, which was to unite Italy under the Papal supremacy. He desired to bring about single-handed what was not to happen for several centuries, and then only through the conjunction of many alien forces; and he worked alone, with impatience, [234]
in the short span of sovereignty allowed him, and used violent means. He could appreciate Michelangelo as a man of his own kind, but he often made him smart under his sudden anger and his utter lack of consideration for others. The artist felt the same violent force of will in himself, and, as the more introspective thinker, may have had a premonition of the failure to which they were both doomed. And so he carved his Moses on the Pope's tomb, not without a reproach against the dead pontiff, as a warning to himself, thus, in self-criticism, rising superior to his own nature.

IV

In 1863 an Englishman, Watkiss Lloyd, devoted a little book to the Moses of Michelangelo. I succeeded in getting hold of this short essay of forty-six pages, and read it with mixed feelings. I once more had an opportunity of experiencing in myself what unworthy and puerile motives enter into our thoughts and acts even in a serious cause. My first feeling was one of regret that the author should have anticipated so much of my thought, which seemed precious to me because it was the result of my own efforts; and it was only in the second instance that I was able to get pleasure from its unexpected confirmation of my opinion. Our views, however, diverge on one very important point.

Lloyd remarks in the first place that the usual descriptions of the figure are incorrect, and that Moses is not in the act of rising[1] – that the right hand is not grasping the beard, but that the index finger alone is resting upon it.[2] Lloyd also recognizes, and this is much more important, that the attitude portrayed can only be explained by postulating a foregoing one, which is not represented, and that the drawing of the left lock of the beard across to the right signifies that the right hand and the left side of [235]
the beard have at a previous stage been in closer and more natural contact. But he suggests another way of reconstructing the earlier contact

1 'But he is not rising or preparing to rise; the bust is fully upright, not thrown forward for the alteration of balance preparatory for such a movement. . . .' (Lloyd, 1863, 10).

2 'Such a description is altogether erroneous; the fillets of the beard are detained by the right hand but they are not held, nor grasped, enclosed or taken hold of. They are even detained but momentarily – momentarily engaged, they are on the point of being free for disengagement' (ibid., 11).

which must necessarily be assumed. According to him, it was not the hand which had been plunged into the beard, but the beard which had been where the hand now is. We must, he says, imagine that just before the sudden interruption the head of the statue was turned far round to its right over the hand which, then as now, was holding the Tables of the Law. The pressure (of the Tables) against the palm of the hand caused the fingers to open naturally beneath the flowing locks of the beard, and the sudden turn of the head to the other side resulted in a part of the beard being detained for an instant by the motionless hand and forming the loop of hair which is to be looked on as a mark of the course it has taken – its 'wake', to use Lloyd's own word.

In rejecting the other possibility, that of the right hand having previously been in contact with the left side of the beard, Lloyd has allowed himself to be influenced by a consideration which shows how near he came to our interpretation. He says that it was not possible for the prophet, even in very great agitation, to have put out his hand to draw his beard across to the right. For in that case his fingers would have been in an entirely different position; and, moreover, such a movement would have allowed the Tables to slip down, since they are only supported by the pressure of the right arm – unless, in Moses' endeavour to save them at the last moment, we think of them as being 'clutched by a gesture so awkward that to imagine it is profanation'.

It is easy to see what the writer has overlooked. He has correctly interpreted the anomalies of the beard as indicating a preceding movement, but he has omitted to apply the same explanation to the no less unnatural details in the position of the Tables. He examines only the data connected with the beard and not those connected with the Tables, whose position he assumes to be the original one. In this way he closes the door to a conception like ours which, by examining certain insignificant details, has arrived at an unexpected interpretation of the meaning and aim of the figure as a whole.

[236] But what if both of us have strayed on to a wrong path? What if we have taken too serious and profound a view of details which were nothing to the artist, details which he had introduced quite arbitrarily or for some purely formal reasons with no hidden intention behind? What if we have shared the fate of so many interpreters who have thought they saw quite clearly things which the artist did not intend either consciously or unconsciously? I cannot tell. I cannot say whether it is reasonable to credit Michelangelo – an artist in whose works there is so much thought striving for expression – with such an elementary want of precision, and

especially whether this can be assumed in regard to the striking and singular features of the statue under discussion. And finally we may be allowed to point out, in all modesty, that the artist is no less responsible than his interpreters for the obscurity which surrounds his work. In his creations Michelangelo has often enough gone to the utmost limit of what is expressible in art; and perhaps in his statue of Moses he has not completely succeeded, if his purpose was to make the passage of a violent gust of passion visible in the signs left behind it in the ensuing calm.

Statuette of Moses attributed to Nicholas of Verdun

Statuette of Moses attributed to Nicholas of Verdun

In a letter to Arnold Zweig dated December 16, 1934, Freud wrote: 'The man (Moses) and what I wanted to make of him pursue me everywhere.'

POSTSCRIPT
(1927)

Several years after the publication of my paper on the Moses of [237]
Michelangelo, which appeared anonymously in *Imago* in 1914, Dr Ernest Jones very kindly sent me a copy of the April number of the *Burlington Magazine* of 1921 (Vol. XXXVIII), which could not fail to turn my interest once more to the interpretation of the statue which I had originally suggested. This number contains [pp. 157–66] a short article by H. P. Mitchell on two bronzes of the twelfth century, now in the Ashmolean Museum at Oxford, which are attributed to an outstanding artist of that day, Nicholas of Verdun. We possess other works by the same hand in Tournay, Arras and Klosterneuburg, near Vienna; his masterpiece is considered to be the Shrine of the Three Kings in Cologne.

One of the two statuettes described by Mitchell, which is just over 23cm high, is identifiable beyond all doubt as a Moses, because of the two Tables of the Law which he holds in his hand. This Moses, too, is represented as seated, enveloped in a flowing robe. His face is expressive of strong passion, mixed, perhaps, with grief; and his hand grasps his long beard and presses its strands between palm and thumb as in a vice. He is, that is to say, making the very gesture which I postulated in Fig. 2 of my former paper as a preliminary stage of the attitude into which Michelangelo has cast him.

A glance at the accompanying illustration will show the main difference between the two compositions, which are separated from each other by an interval of more than three centuries. The Moses of the Lorraine artist is holding the Tables by their top edge with his left hand, resting them on his knee. If we were to transfer them to the other side of his body and put them under his right arm we should have established the preliminary posture of Michelangelo's Moses. If my view of the thrusting of the hand into the beard is right, then the Moses of the year 1180 shows us an instant during his storm of feeling, while the statue in [238]
S. Pietro in Vincoli depicts the calm when the storm is over.

In my opinion this new piece of evidence increases the probability that the interpretation which I attempted in 1914 was a correct one. Perhaps some connoisseur of art will be able to bridge the gulf in time between the Moses of Nicholas of Verdun and the Moses of the Master of the Italian Renaissance by telling us where examples of representations of Moses belonging to the intervening period are to be found.

SOME REFLECTIONS ON SCHOOLBOY PSYCHOLOGY

(1914)

EDITORS' NOTE

ZUR PSYCHOLOGIE DES GYMNASIASTEN

GERMAN EDITIONS

1914 In *Festschrift* celebrating 50th anniversary of foundation of K. k. Erzherzog Rainer-Realgymnasiums (October). [240]

1928 *GS*, **11**, 287–90.
1935 *Z. psychoan. Päd.*, **9**, 307–10.
1946 *GW*, **10**, 204–7.
1970 *SA*, **4**, 237–40.

ENGLISH TRANSLATIONS

'Some Reflections on Schoolboy Psychology'
1955 *SE*, **13**, 241–4. (Tr. James Strachey.)
'On the Psychology of the Grammar-school Boy'
2006 *The Penguin Freud Reader*, 354–7. (Tr. Shaun Whiteside.)

The present translation is a slightly revised and corrected reprint of the *SE* version.

Between the ages of nine and seventeen (1865–73) Freud was at school in Vienna at the 'Leopoldstädter Kommunalreal- und Obergymnasium', popularly known as the 'Sperlgymnasium' from its location in the Sperlgasse. Its name was later changed to 'K. k. Erzherzog-Rainer Realgymnasium'. This paper was written for a collective volume in celebration of the 50th anniversary of the school's foundation. In a letter to a schoolfriend, written by Freud on June 16, 1873 (*Int. Z. Psychoan. Imago*, **26** (1941), 5), he gives an account of his leaving examination at the school. He mentions, in particular, the essay alluded to in the present paper (p. 235 below) on the subject of the choice of a profession, for which he was awarded a distinction mark. (See Freud, 1941*i*, included in 1960*a*.)

SOME REFLECTIONS ON SCHOOLBOY PSYCHOLOGY

It gives you a peculiar feeling if, late in life, you are ordered once again [241]
to write a school essay. But you obey automatically, like the old soldier who, at the word 'Attention!', cannot help dropping whatever he may have in his hands and who finds his little fingers pressed along the seams of his trousers. It is strange how readily you obey the orders, as though nothing in particular had happened in the last half-century. But, in fact, you have grown old in the interval, you are on the eve of your sixtieth birthday, and your physical feelings, as well as your mirror, show unmistakably how far your life's candle is burnt down.

As little as ten years ago, perhaps, you may have had moments at which you suddenly felt quite young again. As you walked through the streets of Vienna – already a greybeard, and weighed down by all the cares of family life – you might come unexpectedly on some well-preserved, elderly gentleman and would greet him humbly almost, because you had recognized him as one of your former schoolmasters. But afterwards you would stop and reflect: 'Was that really he? or only someone deceptively like him? How youthful he looks! And how old you yourself have grown! How old can he be today? Can it be possible that the men who used to stand for us as types of adulthood were really so little older than we were?'

At such moments as these, I used to find, the present time seemed to sink into obscurity and the years between ten and eighteen would rise from the corners of my memory, with all their guesses and illusions, their painful distortions and heartening successes – my first glimpses of an extinct civilization [*Kulturwelt*][T] (which in my case was to bring me as *Kultur*
much consolation as anything else in the struggles of life), my first contacts with the sciences, among which it seemed open to me to choose to which of them I should dedicate what were no doubt my inestimable services. And I seem to remember that through the whole of this time [242]
there ran a premonition of a task ahead, till it found open expression in my school-leaving essay as a wish that I might during the course of my life contribute something to our human knowledge.

Later I became a physician – or a psychologist, rather – and was able to create a new psychological discipline, something that is known as 'psychoanalysis', which is followed today with excited interest, and is greeted with praise and blame, by physicians and enquirers in neighbouring, and in distant, foreign lands – but least of all, of course, in our own country.

As a psychoanalyst I am bound to be concerned more with emotional than intellectual processes, with unconscious than with conscious mental life [*Seelenleben*][T]. My emotion at meeting my old schoolmaster warns me to make a first admission: it is hard to decide whether what affected us more and was of greater importance to us was our concern with the sciences that we were taught or with the personalities of our teachers. It is true, at least, that this second concern was a perpetual undercurrent in all of us, and that in many of us the path to the sciences led only through our teachers. Some of us stopped halfway along that path, and for a few – why not admit as much? – it was on that account blocked for good and all.

Seele

We courted them or turned our backs on them, we imagined sympathies and antipathies in them which probably had no existence, we studied their characters and on theirs we formed or misformed our own. They called up our fiercest opposition and forced us to complete submission; we peered into their little weaknesses, and took pride in their excellences, their knowledge and their justice. At bottom we felt a great affection for them if they gave us any ground for it, though I cannot tell how many of them were aware of this. But it cannot be denied that our position in regard to them was a quite remarkable one and one which may well have had its inconvenience for those concerned. We were from the very first equally inclined to love and to hate them, to criticize and respect them. Psychoanalysis has given the name of 'ambivalence' to this readiness to contradictory attitudes, and it has no difficulty in pointing to the source of ambivalent feelings of such a kind.

[243] For psychoanalysis has taught us that the individual's emotional attitudes to other people, which are of such extreme importance to his later behaviour, are already established at an unexpectedly early age. The nature and quality of the human child's relations to people of his own and the opposite sex have already been laid down in the first six years of his life. He may afterwards develop and transform them in certain directions but he can no longer get rid of them. The people to whom he is in this way fixed are his parents and his brothers and sisters. All those whom he gets to know later become substitute figures for these first objects of his feelings. (We should perhaps add to his parents any other

people, such as nurses, who cared for him in his infancy.) These substitute figures can be classified from his point of view according as they are derived from what we call the 'imagos' of his father, his mother, his brothers and sisters, and so on. His later acquaintances are thus obliged to take over a kind of emotional heritage; they encounter sympathies and antipathies to the production of which they themselves have contributed little. All of his later choices of friendship and love follow upon the basis of the memory traces left behind by these first prototypes.

Of all the imagos of a childhood which, as a rule, is no longer remembered, none is more important for a youth or a man than that of his father. Organic necessity introduces into a man's relation to his father an emotional ambivalence which we have found most strikingly expressed in the Greek myth of King Oedipus. A little boy is bound to love and admire his father, who seems to him the most powerful, the kindest and the wisest creature in the world. God Himself is after all only an exaltation of this picture of a father as he is represented in the mind of early childhood. But soon the other side of this emotional relationship emerges. One's father is recognized as the paramount disturber of one's drives [*Trieblebens*][T]; he becomes a model not only to imitate but also to *Trieb*
get rid of, in order to take his place. Thenceforward affectionate and hostile impulses towards him persist side by side, often to the end of one's life, without either of them being able to do away with the other. It is in this existence of contrary feelings side by side that lies the essential character of what we call emotional ambivalence.

In the second half of childhood a change sets in in the boy's relation to [244]
his father – a change whose importance cannot be exaggerated. From his nursery the boy begins to cast his eyes upon the world outside. And he cannot fail now to make discoveries which undermine his original high opinion of his father and which expedite his detachment from his first ideal. He finds that his father is no longer the mightiest, wisest and richest of beings; he grows dissatisfied with him, he learns to criticize him and to estimate his place in society; and then, as a rule, he makes him pay heavily for the disappointment that has been caused by him. Everything that is hopeful, as well as everything that is unwelcome, in the new generation is determined by this detachment from the father.

It is in this phase of a youth's development that he comes into contact with his teachers. So that we can now understand our relation to our schoolmasters. These men, not all of whom were in fact fathers themselves, became our substitute fathers. That was why, even though they were still quite young, they struck us as so mature and so unattainably

Übertragung

adult. We transferred [*übertrugen*][T] on to them the respect and expectations attaching to the omniscient father of our childhood, and we then began to treat them as we treated our fathers at home. We confronted them with the ambivalence that we had acquired in our own families and with its help we struggled with them as we had been in the habit of struggling with our fathers in the flesh. Unless we take into account our nurseries and our family homes, our behaviour to our schoolmasters would be not only incomprehensible but inexcusable.

As schoolboys we had other and scarcely less important experiences with the successors of our brothers and sisters – our schoolfellows – but these must be described elsewhere. In a commemoration of the jubilee of our school it is on the masters that our thoughts must rest.

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

VOLUME XIV

The Committee, 1922
(*Seated: Freud, Ferenczi, Sachs; standing: Rank, Abraham, Eitingon, Jones.*)

The Committee, 1922

The Committee was founded in 1912, on the suggestion of Ernest Jones, as a reaction against the crises and quarrels attending the various secessions. In a letter to Max Eitingon dated October 22, 1919, immediately following Eitingon's appointment to it, Freud wrote: 'The secret of this Committee is that it has taken from me my most burdensome care for the future, so that I can calmly follow my path to the end.' In a subsequent letter to Ernst Simmel dated November 11, 1928, Freud wrote: 'Rank then broke the magic spell; his secession and Abraham's death dissolved the Committee.'

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

ON THE HISTORY OF THE PSYCHOANALYTIC MOVEMENT

The present translation is a revised and corrected reprint of the *SE* version.

In the German editions before 1924 (and in the manuscript fair copy), the date 'February, 1914' appears at the end of the work. It seems in fact to have been written in January and February of that year. A few alterations of a minor character were made in the 1924 edition and the long footnote on p. 29 below was added.

A full account of the situation which led to the writing of this work is given in Chapter V of the second volume of Ernest Jones's Freud biography (1955, 142 ff.). Here it is enough to summarize the position very briefly. Adler's disagreements with [4] the views of Freud had come to a head in 1910, and Jung's some three years later. In spite of the divergences which separated them from Freud, they had both long persisted, however, in describing their theories as 'psychoanalysis'. The aim of the present paper was to state clearly the fundamental postulates and hypotheses of

psychoanalysis, to show that the theories of Adler and Jung were totally incompatible with them, and to draw the inference that it would lead to nothing but general confusion if these contradictory sets of views were all given the same name. And although for many years popular opinion continued to insist that there were 'three schools of psychoanalysis', Freud's argument eventually prevailed. Adler had already chosen the name of 'Individual Psychology' for his theories, and soon afterwards Jung adopted that of 'Analytical Psychology' for his.

In order to make the essential principles of psychoanalysis perfectly plain, Freud traced the history of their development from their pre-analytic beginnings. The first section of the paper covers the period during which he himself was the only person concerned – that is, up till about 1902. The second section takes the story on till about 1910 – the time during which psychoanalytic views first began to extend to wider circles. It is only in the third section that Freud comes to a discussion of the dissident views, first of Adler and then of Jung, and points out the fundamental respects in which they depart from the findings of psychoanalysis. In this last section, and also to some extent in the rest of the paper, we find Freud adopting a far more belligerent tone than in any of his other writings. And in view of his experiences during the preceding three or four years, this unusual mood cannot be considered surprising.

Discussions of the views of Adler and Jung can be found in two other works of Freud's contemporary with the present one. In the paper on 'Narcissism' (1914*c*), which was being composed at almost exactly the same time as the 'History', some paragraphs of controversy with Jung appear at the end of Section I (p. 69 f. below) and a similar passage about Adler at the beginning of Section III (p. 80). The case history of the 'Wolf Man' (1918*b*), *RSE*, **17**, which was written in the main at the end of 1914 though only published (with two additional passages) in 1918, was largely
[5] designed as an empirical refutation of Adler and Jung, and contains many attacks on their theories. In Freud's later works there are a number of scattered references to these controversies (chiefly in expository or semi-autobiographical writings), but these are always in a drier tone and never very extensive. Special mention must, however, be made of a closely reasoned discussion of Adler's views on the driving forces leading to repression in the final section of Freud's paper on beating phantasies (1919*e*), ibid., **17**, 195 ff.[1]

As regards the purely historical and autobiographical portions of the work, it must be remarked that Freud went over more or less the same ground in his *Autobiographical Study* (1925*d*), ibid., **20**, though it supplements the present paper at some points. For a very much fuller treatment of the subject the reader must, of course, be referred to Ernest Jones's three-volume biography of Freud. No attempt has been made in the footnotes to the present translation to go over the same ground as is covered in that work.

1 Another severe criticism, of some length, of Adler's views can be found in Lecture XXXIV of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 123–6.

ON THE HISTORY OF THE PSYCHOANALYTIC MOVEMENT

Fluctuat nec mergitur
(On the coat of arms of the City of Paris[1])

I

No-one need be surprised at the subjective character of the contribution [7]
I propose to make here to the history of the psychoanalytic movement, nor need anyone wonder at the part I play in it. For psychoanalysis is my creation; for ten years I was the only person who concerned himself with it, and all the dissatisfaction which the new phenomenon aroused in my contemporaries has been poured out in the form of criticisms on my head. Although it is a long time now since I was the only psychoanalyst, I consider myself justified in maintaining that even today no-one can know better than I do what psychoanalysis is, how it differs from other ways of investigating the life of the mind [*Seelenleben*][T], and precisely *Seele*
what should be called psychoanalysis and what would better be described by some other name. In thus repudiating what seems to me a cool act of usurpation, I am indirectly informing the readers of this *Jahrbuch* of the events that have led to the changes in its editorship and format.[2]

In 1909, in the lecture room of an American university, I had my first opportunity of speaking in public about psychoanalysis.[3] The occasion was a momentous one for my work, and moved by this thought I then declared that it was not I who had brought psychoanalysis into existence: [8]
the credit for this was due to someone else, to Josef Breuer, whose work had been done at a time when I was still a student engaged in passing my examinations (1880–2). Since I gave those lectures, however, some well-disposed friends have suggested to me a doubt whether my gratitude was

1 [The coat of arms represents a ship, and the device may be rendered 'it is tossed by the waves, but does not sink'. Freud quoted this motto twice in his correspondence with Fliess, in connection with his own state of mind (Letters 119 and 143, Freud, 1950*a*).]

2 [The *Jahrbuch* had hitherto been under the direction of Bleuler and Freud and edited by Jung. Freud himself now became sole director and the editorship was taken over by Abraham and Hitschmann. Cf. also p. 41 below.]

3 In my 'Five Lectures' (1910*a*), delivered at Clark University. [See below, p. 26.]

not expressed too extravagantly on that occasion. In their view I ought to have done as I had previously been accustomed to do: treated Breuer's 'cathartic procedure' as a preliminary stage of psychoanalysis, and represented psychoanalysis itself as beginning with my discarding the hypnotic technique and introducing free associations [*freien Assoziationen*]T. It is of no great importance in any case whether the history of psychoanalysis is reckoned as beginning with the cathartic method or with my modification of it; I refer to this uninteresting point merely because certain opponents of psychoanalysis have a habit of occasionally recollecting that after all the art of psychoanalysis was not invented by me, but by Breuer. This only happens, of course, if their views allow them to find something in it deserving attention; if they set no such limits to their rejection of it, psychoanalysis is always without question my work alone. I have never heard that Breuer's great share in psychoanalysis has earned him a proportionate measure of criticism and abuse. As I have long recognized that to stir up contradiction and arouse bitterness is the inevitable fate [*Schicksal*]T of psychoanalysis, I have come to the conclusion that I must be the true originator of all that is particularly characteristic in it. I am happy to be able to add that none of the efforts to minimize my part in creating this much-abused analysis has ever come from Breuer himself or could claim any support from him.

Assoziation

Breuer's discoveries have so often been described that I can dispense with discussing them in detail here. These were the fundamental fact that the symptoms of hysterical patients are founded upon scenes in their past lives which have made a great impression on them but have been forgotten (traumas); the therapy founded upon this, which consisted in causing them to remember and reproduce these experiences in a state of hypnosis (catharsis); and the fragment of theory inferred from it, which was that these symptoms represented an abnormal employment of amounts of excitation [*Erregungsgrössen*]T which had not been disposed of (conversion). Whenever Breuer, in his theoretical contribution to the *Studies on Hysteria* (1895*d*), referred to this process of conversion, he always added my name in brackets after it,[1] as though the priority for this first attempt at theoretical evaluation belonged to me. I believe that

Erregung

[9]

1 [There seems to be some mistake here. In the course of Breuer's contribution he uses the term 'conversion' (or its derivatives) at least fifteen times. But only once (the first time he uses it, *RSE*, **2**, 184) does he add Freud's name in brackets. It seems possible that Freud saw some preliminary version of Breuer's manuscript and dissuaded him from adding his name more than once in the printed book. The first published use of the term was before the *Studies on Hysteria*, in Freud's first paper on 'The Neuropsychoses of Defence' (1894*a*), ibid., **3**, 46.]

actually this distinction relates only to the name, and that the conception [*Auffassung*][T] came to us simultaneously and together.

It is well known, too, that after Breuer made his first discovery of the cathartic method he let it rest for a number of years, and only took it up again at my instigation, on my return from my studies under Charcot.[1] He had a large consulting practice in medicine which made great claims on him; I myself had only unwillingly taken up the profession of medicine, but I had at that time a strong motive for helping people suffering from nervous affections or at least for wishing to understand something about their states. I had embarked upon physical therapy, and had felt absolutely helpless after the disappointing results from my study of Erb's *Elektrotherapie* [1882], which put forward such a number of indications and recommendations. If I did not at the time arrive on my own account at the conclusion which Moebius[2] established later, that the successes of electrical treatment in nervous patients are the effects of suggestion, there is no doubt that only the total absence of these promised successes was to blame. Treatment by suggestion during deep hypnosis, which I learnt from Liébeault's and Bernheim's highly impressive demonstrations,[3] then seemed to offer a satisfactory substitute for the failure of electrical treatment. But the practice of *investigating* patients in a state of hypnosis, with which Breuer made me acquainted – a practice which combined an automatic mode of operation with the satisfaction of scientific curiosity – was bound to be incomparably more attractive than the monotonous, forcible prohibitions used in treatment by suggestion, prohibitions which stood in the way of all research.

We have recently received a piece of advice, purporting to represent [10]
one of the latest developments of psychoanalysis, to the effect that the current conflict and the exciting cause of illness are to be brought into the foreground in analysis.[4] Now this is exactly what Breuer and I used to do at the beginning of our work with the cathartic method. We led the patient's attention directly to the traumatic scene in which the symptom had arisen, and we endeavoured to discover the mental conflict in that scene and to release the suppressed affect in it. In the course of this we discovered the mental process, characteristic of the neuroses, which I later named 'regression'. The patient's associations [*Assoziationen*]

1 [Freud worked at the Salpêtrière in Paris during the winter of 1885–6. See his 'Report on my Studies' (1956*a* [1886]), *NSW*, **4**; *RSE*, **1**, 5 ff.]

2 [Paul Moebius (1853–1907) was a lecturer in Neurology at Leipzig University.]

3 [Freud spent some weeks at Nancy in 1889.]

4 [Cf. below, p. 55 f.]

moved back from the scene which we were trying to elucidate to earlier experiences, and compelled the analysis, which was supposed to correct the present, to occupy itself with the past. This regression led constantly further backwards; at first it seemed regularly to bring us to puberty; later on, failures and points which still eluded explanation drew the analytic work still further back into years of childhood which had hitherto been inaccessible to any kind of exploration. This regressive direction became an important characteristic of analysis. It appeared that psychoanalysis could explain nothing belonging to the present without referring back to something past; indeed, that every pathogenic experience implied a previous experience which, though not in itself pathogenic, had yet endowed the later one with its pathogenic quality. The temptation to confine one's attention to the known present exciting cause was so strong, however, that even in later analyses I gave way to it. In the analysis of the patient I named 'Dora' [1905*e*], carried out in 1899,[1] I had knowledge of the scene which occasioned the outbreak of the current illness. I tried innumerable times to submit this experience to analysis, but even direct demands always failed to produce from her anything more than the same meagre and incomplete description of it. Not until a long detour, leading back over her earliest childhood, had been made did a dream present itself which on analysis brought to her mind the hitherto forgotten details of this scene, so that a comprehension and a solution to the current conflict became possible.

[11] This one example shows how very misleading is the advice referred to above, and what a degree of scientific regression is represented by the neglect of regression in analytic technique which is thus recommended to us.

The first difference between Breuer and myself came to light on a question concerning the finer psychical mechanism of hysteria. He gave preference to a theory which was still to some extent physiological, as one might say; he tried to explain the mental splitting in hysterical patients by the absence of communication between various mental states ('states of consciousness', as we called them at that time), and he therefore constructed the theory of 'hypnoid states', the products of which were supposed to penetrate into 'waking consciousness' like unassimilated foreign bodies. I had taken the matter less scientifically; everywhere I seemed to discern motives and tendencies [*Tendenzen und Neigungen*] analogous to those of everyday life, and I looked upon psychical splitting itself as an effect of a process of repelling which at

1 [This is a slip for '1900'. See 1905*e*; *RSE*, 7, 5.]

that time I called 'defence' [*'Abwehr'*][T], and later, 'repression'[1] [*'Verdrängung'*][T]. I made a shortlived attempt to allow the two mechanisms a separate existence side by side, but as observation showed me always and only one thing, it was not long before my 'defence' theory took up its stand opposite his 'hypnoid' one.

I am quite sure, however, that this opposition between our views had nothing to do with the breach in our relations which followed shortly after. This had deeper causes, but it came about in such a way that at first I did not understand it; it was only later that I learnt from many clear indications how to interpret [*deuten*][T] it. It will be remembered that Breuer said of his famous first patient that the element of sexuality [*sexuale*][T] was astonishingly undeveloped in her[2] and had contributed nothing to the very rich clinical picture of the case. I have always wondered why the critics did not more often cite this assertion of Breuer's as an argument against my contention of a sexual aetiology in the neuroses, and even today I do not know whether I ought to regard the omission as evidence of tact or of carelessness on their part. Anyone who reads the history of Breuer's case now in the light of the knowledge gained in the last twenty years will at once perceive the symbolism in it – the snakes, the stiffening, the paralysis of the arm – and, on taking into account the situation at the bedside of the young woman's sick father, will easily guess the real interpretation of her symptoms; his opinion of the part played by sexuality in her mental life will therefore be very different from that of her doctor. In his treatment of her case, Breuer was able to make use of a very intense suggestive rapport with the patient, which may serve us as a complete prototype of what we call 'transference' [*'Übertragung'*][T] today. Now I have strong reasons for suspecting that after all her symptoms had been relieved Breuer must have discovered from further indications the sexual motivation of this transference, but that the universal nature of this unexpected phenomenon escaped him, with the result that, as though confronted with an 'untoward event',[3] he broke off all further investigation. He never said this to me in so many words, but he told me enough at different times to justify this reconstruction of what happened. When I later began more and more resolutely to put forward the significance of sexuality in the aetiology of

Deutung

Sex

[12]

1 [In his *Inhibitions, Symptoms and Anxiety* (1926*d*), Freud revived the term 'defence' to express a general concept of which 'repression' would denote a subspecies. See Editors' Appendix A to this; *RSE*, **20**, 153–4.]

2 [See the second paragraph of his case history of Anna O. in Breuer & Freud (1895*d*), ibid., **2**, 19.]

3 [In English in the original. A fuller account of this can be found in the first volume of Ernest Jones's biography (1953, 246 f.).]

neuroses, he was the first to show the reaction of distaste and repudiation which was later to become so familiar to me, but which at that time I had not yet learnt to recognize as my inevitable fate.[1]

The fact of the emergence of the transference in its crudely sexual form, whether affectionate or hostile, in every treatment of a neurosis, although this is neither desired nor induced by either doctor or patient, has always seemed to me the most irrefragable proof that the source of the driving forces [*Triebkräfte*][T] of neurosis lies in sexual life. This argument has never received anything approaching the degree of attention that it merits, for if it had, investigations in this field would leave no other conclusion open. As far as I am concerned, this argument has remained the decisive one, over and above the more specific findings of analytic work.

There was some consolation for the bad reception accorded to my contention of a sexual aetiology in the neuroses even by my more intimate
[13] circle of friends – for a vacuum rapidly formed itself about my person – in the thought that I was taking up the fight for a new and original idea. But, one day, certain memories gathered in my mind which disturbed this pleasing notion, but which gave me in exchange a valuable insight into the processes of human creative activity and the nature of human knowledge. The idea for which I was being made responsible had by no means originated with me. It had been imparted to me by three people whose opinion had commanded my deepest respect – by Breuer himself, by Charcot, and by Chrobak, the gynaecologist at the university, perhaps the most eminent of all our Vienna physicians.[2] These three men had all communicated to me a piece of knowledge which, strictly speaking, they
Verleugnung themselves did not possess. Two of them later denied [*verleugneten*][T] having done so when I reminded them of the fact; the third (the great Charcot) would probably have done the same if it had been granted me to see him again. But these three identical opinions, which I had heard without understanding, had lain dormant in my mind for years, until one day they awoke in the form of an apparently original discovery.[3]

One day, when I was a young house physician, I was walking across the town with Breuer, when a man came up who evidently wanted to speak to him urgently. I fell behind. As soon as Breuer was free, he told me in his friendly, instructive way that this man was the husband of a patient of his

1 [A discussion of Freud's relations with Breuer can be found in the Editors' Introduction to Volume 2 of the *RSE*.]

2 [Rudolf Chrobak (1843–1910) was Professor of Gynaecology at Vienna from 1880 to 1908.]

3 [Freud had mentioned this at a meeting of the Vienna Psychoanalytical Society on April 1, 1908. (Cf. the *Minutes* of the Society, **1**.)]

and had brought him some news of her. The wife, he added, was behaving in such a peculiar way in society that she had been brought to him for treatment as a nervous case. He concluded: 'These things are always *secrets d'alcôve*!' I asked him in astonishment what he meant, and he answered by explaining the word *alcôve* ('marriage bed') to me, for he failed to realize how extraordinary the *matter* of his statement seemed to me.

Some years later, at one of Charcot's evening receptions, I happened to be standing near the great teacher at a moment when he appeared to be telling Brouardel[1] a very interesting story about something that had [14] happened during his day's work. I hardly heard the beginning, but gradually my attention was seized by what he was talking of: a young married couple from a distant country in the East – the woman a severe sufferer, the man either impotent or exceedingly awkward. '*Tâchez donc*,' I heard Charcot repeating, '*je vous assure, vous y arriverez*.'[2] Brouardel, who spoke less loudly, must have expressed his astonishment that symptoms like the wife's could have been produced by such circumstances. For Charcot suddenly broke out with great animation: '*Mais, dans des cas pareils c'est toujours la chose génitale, toujours . . . toujours . . . toujours*';[3] and he crossed his arms over his stomach, hugging himself and jumping up and down on his toes several times in his own characteristically lively way. I know that for a moment I was almost paralysed with amazement and said to myself: 'Well, but if he knows that, why does he never say so?' But the impression was soon forgotten; brain anatomy and the experimental induction of hysterical paralyses absorbed all my interest.

A year later, I had begun my medical career in Vienna as a lecturer in nervous diseases, and in everything relating to the aetiology of the neuroses I was still as ignorant and innocent as one could expect of a promising student trained at a university. One day I had a friendly message from Chrobak, asking me to take a woman patient of his to whom he could not give enough time, owing to his new appointment as a university teacher. I arrived at the patient's house before he did and found that she was suffering from attacks of meaningless anxiety [*sinnlosen Angstanfällen*][T], and could only be soothed by the most precise information about *Angst* where her doctor was at every moment of the day. When Chrobak arrived he took me aside and told me that the patient's anxiety was due to the fact

1 [P. C. H. Brouardel (1837–1906) was appointed Professor of Forensic Medicine in Paris in 1879. Freud mentions him appreciatively in his 'Report on my Studies in Paris and Berlin' (1956*a* [1886]), *NSW*, **4**; *RSE*, **1**, and also in his Preface to Bourke's *Scatalogic Rites of All Nations* (Freud, 1913*k*; *RSE*, **12**).]

2 ['Go on trying! I promise you, you'll succeed.']

3 ['But in this sort of case it's always a question of the genitals – always, always, always.']

that although she had been married for eighteen years she was still *virgo intacta*. The husband was absolutely impotent. In such cases, he said, there was nothing for a medical man to do but to shield this domestic misfortune with his own reputation, and put up with it if people shrugged their shoulders and said of him: 'He's no good if he can't cure her after so
[15] many years.' The sole prescription for such a malady, he added, is familiar enough to us, but we cannot order it. It runs:

'℞ Penis normalis
dosim
repetatur!'

I had never heard of such a prescription, and felt inclined to shake my head over my kind friend's cynicism.

I have not of course disclosed the illustrious parentage of this scandalous idea in order to saddle other people with the responsibility for it. I am well aware that it is one thing to give utterance to an idea once or twice in the form of a passing *aperçu*, and quite another to mean it seriously – to take it literally and pursue it in the face of every contradictory detail, and to win it a place among accepted truths. It is the difference between a casual flirtation and a legal marriage with all its duties and difficulties. '*Épouser les idées de . . .*'[1] is no uncommon figure of speech, at any rate in French.

Among the other new factors which were added to the cathartic procedure as a result of my work and which transformed it into psychoanalysis, I may mention in particular the theory of repression and resistance, the recognition of infantile sexuality, and the interpreting and exploiting of dreams as a source of knowledge of the unconscious.

The theory of repression quite certainly came to me independently of any other source; I know of no outside impression which might have suggested it to me, and for a long time I imagined it to be entirely original, until Otto Rank (1910*b*) showed us a passage in Schopenhauer's *World as Will and Idea* in which the philosopher seeks to give an explanation of insanity. What he says there about the struggle against accepting a distressing piece of reality coincides with my concept of repression so completely that once again I owe the chance of making a discovery to my not being well read. Yet others have read the passage and passed it by without making this discovery, and perhaps the same would have happened to me if in my young days I had had more taste
Versagung for reading philosophical works. In later years I have denied [*versagt*]^{T} myself the very great pleasure of reading the works of Nietzsche, with

1 ['To espouse an idea.']

the deliberate object of not being hampered in working out the impressions received in psychoanalysis by any sort of anticipatory ideas [*Erwartungsvorstellung*][T]. I had therefore to be prepared – and I am so, gladly – to forgo all claims to priority in the many instances in which laborious psychoanalytic investigation can merely confirm the truths which the philosopher recognized by intuition.[1] [16] *Vorstellung*

The theory of repression is the cornerstone on which the whole structure of psychoanalysis rests. It is the most essential part of it; and yet it is nothing but a theoretical formulation of a phenomenon which may be observed as often as one pleases if one undertakes an analysis of a neurotic without resorting to hypnosis. In such cases one comes across a resistance which opposes the work of analysis and in order to frustrate it pleads a failure of memory. The use of hypnosis was bound to hide this resistance; the history of psychoanalysis proper, therefore, only begins with the new technique that dispenses with hypnosis. The theoretical consideration of the fact that this resistance coincides with an amnesia leads inevitably to the view of unconscious mental activity which is peculiar to psychoanalysis and which, too, distinguishes it quite clearly from philosophical speculations about the unconscious. It may thus be said that the theory of psychoanalysis is an attempt to account for two striking and unexpected facts of observation which emerge whenever an attempt is made to trace the symptoms of a neurotic back to their sources in his past life: the facts of transference and of resistance. Any line of investigation which recognizes these two facts and takes them as the starting point of its work has a right to call itself psychoanalysis, even though it arrives at results other than my own. But anyone who takes up other sides of the problem while avoiding these two hypotheses will hardly escape a charge of misappropriation of property by attempted impersonation, if he persists in calling himself a psychoanalyst.

If anyone sought to place the theory of repression and resistance among the *premises* instead of the *findings* of psychoanalysis, I should oppose him most emphatically. Such premises of a general psychological and biological nature do exist, and it would be useful to consider them on some other occasion; but the theory of repression is a product of psychoanalytic work, a theoretical inference legitimately drawn from innumerable observations. [17]

1 [Other instances of the anticipation of Freud's ideas are discussed by him in his 'Note on the Prehistory of the Technique of Analysis' (1920*b*), *RSE*, **18**, 253 ff. See also the remarks on Popper-Lynkeus below (p. 16). The possibility that Freud derived the term 'repression' indirectly from the early nineteenth-century philosopher Herbart is discussed by Ernest Jones (1953, 407 ff.). Cf. the Editors' Note to the paper on repression, below, p. 127, and 'The Unconscious', p. 144.]

Another product of this sort was the hypothesis of infantile sexuality. This, however, was made at a much later date. In the early days of tentative investigation by analysis no such thing was thought of. At first it was merely observed that the effects of present-day experiences had to be traced back to something in the past. But enquirers often find more than they bargain for. One was drawn further and further back into the past; one hoped at last to be able to stop at puberty, the period in which the sexual impulses [*Sexualregungen*][T] are traditionally supposed to awake. But in vain; the tracks led still further back into childhood and into its earlier years. On the way, a mistaken idea had to be overcome which might have been almost fatal to the young science. Influenced by Charcot's view of the traumatic origin of hysteria, one was readily inclined to accept as true and aetiologically significant the statements made by patients in which they ascribed their symptoms to passive sexual experiences in the first years of childhood – to put it bluntly, to seduction. When this aetiology broke down under the weight of its own improbability and contradiction in definitely ascertainable circumstances, the result at first was helpless bewilderment. Analysis had led back to these infantile sexual traumas by the right path, and yet they were not true. The firm ground of reality was gone. At that time, I would gladly have given up the whole work, just as my esteemed predecessor, Breuer, had done when he made his unwelcome discovery. Perhaps I persevered only because I no longer had any choice and could not then begin again at anything else. At last came the reflection that, after all, one had no right to despair because one has been deceived in one's expectations; one must revise those expectations. If hysterical subjects trace back their symptoms to traumas that are fictitious, then the new fact which emerges is precisely that they create such scenes in *phantasy* [*phantasieren*][T], and this psychical reality needs to be taken into account alongside practical reality. This reflection was soon followed by the discovery that these phantasies were intended to cover up the autoerotic activity of the first years of childhood, to embellish it and raise it to a higher plane. And now, from behind the phantasies, the whole range of a child's sexual life came to light.[1]

Regung

Phantasie

[18]

1 [Freud's contemporary account of this rectification of his theory can be found in his letter to Fliess of September 21, 1897 (1950*a*, Letter 69). Cf. his account of it in his *Autobiographical Study* (1925*d*), *RSE*, **20**, 29 f. His first explicit published acknowledgement of it was made almost ten years later in a paper on sexuality in the neuroses (1906*a*), ibid., **7**, 284. In Lecture XXXIII of the *New Introductory Lectures* Freud remarked that these phantasies related in fact not to the father but to the mother (ibid., **22**, 106).]

With this sexual activity of the first years of childhood the inherited constitution of the individual also came into its own. Disposition and experience are here linked up in an indissoluble aetiological unity. For *disposition* exaggerates impressions which would otherwise have been completely commonplace and have had no effect, so that they become traumas giving rise to stimulations and fixations; while *experiences* awaken factors in the disposition which, without them, might have long remained dormant and perhaps never have developed. The last word on the subject of traumatic aetiology was spoken later by Abraham [1907], when he pointed out that the sexual constitution which is peculiar to children is precisely calculated to provoke sexual experiences of a particular kind – namely traumas.

In the beginning, my statements about infantile sexuality were founded almost exclusively on the findings of analysis in adults which led back into the past. I had no opportunity of direct observations on children. It was therefore a very great triumph when it became possible years later to confirm almost all my inferences by direct observation and the analysis of very young children – a triumph that lost some of its magnitude as one gradually realized that the nature of the discovery was such that one should really be ashamed of having had to make it. The further one carried these observations on children, the more self-evident the facts became; but the more astonishing, too, did it become that one had taken so much trouble to overlook them.

Such a certain conviction of the existence and importance of infantile sexuality can, however, only be obtained by the method of analysis, by pursuing the symptoms and peculiarities of neurotics back to their ultimate sources, the discovery of which then explains whatever is [19]
explicable in them and enables whatever is modifiable to be changed. I can understand that one would arrive at different results if, as C. G. Jung has recently done, one first forms a theoretical conception of the nature of the sexual drive [*Sexualtriebes*][T] and then seeks to *Trieb*
explain the life of children on that basis. A conception of this kind is bound to be selected arbitrarily or in accordance with irrelevant considerations, and runs the risk of proving inadequate for the field to which one is seeking to apply it. It is true that the analytic method, too, leads to certain ultimate difficulties and obscurities in regard to sexuality and its relation to the total life of the individual. But these problems cannot be got rid of by speculation; they must await solution through other observations or through observations in other fields.

I need say little about the interpretation of dreams [*Traumdeutung*]. It came as the first-fruits of the technical innovation I had adopted when, following a dim presentiment, I decided to replace hypnosis with free association [*freien Assoziation*]. My desire for knowledge had not at the start been directed towards understanding dreams. I do not know of any outside influence which drew my interest to them or inspired me with any helpful expectations. Before Breuer and I ceased to meet I only just had time to tell him in a single sentence that I now understood how
Übersetzung to translate [*übersetzen*][T] dreams. Since this was how the discovery came about, it followed that the *symbolism* in the language of dreams was almost the last thing to become accessible to me, for the dreamer's associations [*Assoziationen*] help very little towards understanding symbols. I have held fast to the habit of always studying things themselves before looking for information about them in books, and therefore I was able to establish the symbolism of dreams for myself before I was led to it by Scherner's work on the subject [1861]. It was only later that I came to appreciate to its full extent this mode of expression of dreams. This was partly through the influence of the works of Stekel, who at first did such very creditable work but afterwards went totally astray.[1] The close connection between psychoanalytic dream interpretation and the art of interpreting dreams as practised and held in such high esteem in
[20] antiquity only became clear to me much later. Later on I found the essential characteristic and most important part of my dream theory – the derivation of dream distortion from an internal conflict, a kind of inner dishonesty – in a writer who was ignorant, it is true, of medicine, though not of philosophy, the famous engineer J. Popper, who published his *Phantasien eines Realisten* [1899] under the name of Lynkeus.[2]

The interpretation of dreams became a solace and a support to me in those arduous first years of analysis, when I had to master the technique, clinical phenomena and therapy of the neuroses all at the same time. At that period I was completely isolated and in the network of problems and accumulation of difficulties I often dreaded losing my bearings and also my confidence. There were often patients with whom an unaccountably long time elapsed before my hypothesis, that a neurosis was bound to become intelligible through analysis, proved true; but these patients' dreams, which might be regarded as analogues of their symptoms, almost always confirmed the hypothesis.

1 [A longer discussion of Stekel's influence is contained in a passage added by Freud in 1925 to the section on symbolism, Chapter VI (E), in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 313.]

2 [See Freud's two papers on this: (1923*f*), ibid., **19**, and (1932*c*), ibid., **22**. The word 'famous' in this sentence was added in 1924.]

It was only my success in this direction that enabled me to persevere. The result is that I have acquired a habit of gauging the measure of a psychologist's understanding by his attitude to dream interpretation; and I have observed with satisfaction that most of the opponents of psychoanalysis avoid this field altogether or else display remarkable clumsiness if they attempt to deal with it. Moreover, I soon saw the necessity of carrying out a self-analysis, and this I did with the help of a series of my own dreams which led me back through all the events of my childhood; and I am still of the opinion today that this kind of analysis may suffice for anyone who is a good dreamer and not too abnormal.[1]

I think that by thus unrolling the story of the development of psychoanalysis I have shown what it is, better than by a systematic description [21]
of it. I did not at first perceive the peculiar nature of what I had discovered. I unhesitatingly sacrificed my growing popularity as a doctor, and the increase in attendance during my consulting hours, by making a systematic enquiry into the sexual factors involved in the causation of my patients' neuroses; and this brought me a great many new facts which finally confirmed my conviction of the practical importance of the sexual factor. I innocently addressed a meeting of the Vienna Society for Psychiatry and Neurology with Krafft-Ebing[2] in the chair [cf. Freud, 1896*c*; *RSE*, **3**], expecting that the material losses I had willingly undergone would be made up for by the interest and recognition of my colleagues. I treated my discoveries as ordinary contributions to science and hoped they would be received in the same spirit. But the silence which my communications met with, the void which formed itself about

1 [Freud's contemporary account of important parts of his self-analysis can be found in the Fliess correspondence (1950*a*), particularly in Letters 70 and 71, written in October, 1897. – He did not always take such a favourable view of self-analysis as in the text above. For instance, in a letter to Fliess of November 14, 1897 (1950*a*, Letter 75), he wrote: 'My self-analysis is still interrupted and I have realized the reason. I can only analyse myself with the help of knowledge obtained objectively (like an outsider). Genuine self-analysis is impossible; otherwise there would be no [neurotic] illness. Since I still find some puzzles in my patients, they are bound to hold me up in my self-analysis.' (*RSE*, **1**, 297.) Similarly, near the end of his life, in a short note on a parapraxis (1935*b*), ibid., **22**, 250, he remarked in passing: 'In self-analysis the danger of incompleteness is particularly great. One is too soon satisfied with a part explanation, behind which resistance may easily be keeping back something that is more important perhaps.' Against these may be set the cautiously appreciative words which he prefaced to a paper by E. Pickworth Farrow (1926) giving the findings of a self-analysis (Freud, 1926*c*; *RSE*, **20**). In the case of *training* analyses at all events, he speaks strongly in favour of the need for analysis by some other person – for instance, in one of his papers on technique written not long before the present paper (1912*e*), ibid., **12**, and again in the very much later 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**.]

2 [R. von Krafft-Ebing (1840–1903) was Professor of Psychiatry at Strasbourg 1872–3, at Graz 1873–89, where he also directed the provincial mental hospital, and at Vienna 1889–1902. He was also distinguished for his work on criminology, neurology and psychopathia sexualis.]

me, the hints that were conveyed to me, gradually made me realize that assertions on the part played by sexuality in the aetiology of the neuroses cannot count upon meeting with the same kind of treatment as other communications. I understood that from now onwards I was one of those who have 'disturbed the sleep of the world', as Hebbel says,[1] and
[22] that I could not reckon upon objectivity and tolerance. Since, however, my conviction of the general accuracy of my observations and conclusions grew even stronger, and since neither my confidence in my own judgement nor my moral courage were precisely small, the outcome of the situation could not be in doubt. I made up my mind to believe that it had been my fortune to discover some particularly important facts and connections, and I was prepared to accept the fate that sometimes accompanies such discoveries.

I pictured the future as follows: I should probably succeed in maintaining myself by means of the therapeutic success of the new procedure, but science would ignore me entirely during my lifetime; some decades later, someone else would infallibly come upon the same things – for which the time was not now ripe – would achieve recognition for them and bring me honour as a forerunner whose failure had been inevitable. Meanwhile, like Robinson Crusoe, I settled down as comfortably as possible on my desert island. When I look back to those lonely years, away from the pressures and confusions of today, it seems like a glorious heroic age. My 'splendid isolation'[2] was not without its advantages and charms. I did not have to read any publications, nor listen to any ill-informed opponents; I was not subject to influence from any quarter; there was nothing to hustle me. I learnt to restrain speculative tendencies and to follow the unforgotten advice of my master, Charcot: to look at the same things again and again until they themselves begin to speak.[3] My publications, which I was able to place with a little trouble, could always lag far behind my knowledge, and could be postponed as long as I pleased, since there was no doubtful 'priority' to be defended. *The Interpretation of Dreams*, for instance, was finished in all essentials at the beginning of 1896[4] but was not written out until the summer of 1899. The analysis of 'Dora' was over at the end of 1899 [1900];[5] the case history was written in the next

1 [A reference to Kandaules' words to Gyges in Hebbel's *Gyges und sein Ring*, Act V, Scene 1.]

2 [In English in the original.]

3 [The sentence appears, in slightly different words, in Freud's obituary of Charcot (1893*f*), *NSW*, **4**; *RSE*, **3**, 12.]

4 [See, however, the Editors' Introduction to *The Interpretation of Dreams* (1900*a*), ibid., **4**, xvii ff.]

5 [See footnote, p. 8 above.]

two weeks, but was not published until 1905. Meanwhile my writings were not reviewed in the medical journals, or, if as an exception they *were* reviewed, they were dismissed with expressions of scornful or pity- [23]
ing superiority. Occasionally a colleague would make some reference to me in one of his publications; it would be very short and not at all flattering – words such as 'eccentric', 'extreme' or 'very peculiar' would be used. It once happened that an assistant at the clinic in Vienna where I gave my university lectures asked me for permission to attend the course. He listened very attentively and said nothing; after the last lecture was over he offered to join me outside. As we walked away, he told me that with his chief's knowledge he had written a book combating my views; he regretted very much, however, that he had not first learnt more about them from my lectures, for in that case he would have written much of it differently. He had indeed enquired at the clinic whether he had not better first read *The Interpretation of Dreams*, but had been advised against doing so – it was not worth the trouble. He then himself compared the structure of my theory [*Lehrgebäude*][T], so far as he now understood it, *Gebäude*
with that of the Catholic Church as regards its internal solidity. In the interests of the salvation of his soul, I shall assume that this remark implied a certain amount of appreciation. But he concluded by saying that it was too late to alter anything in his book, since it was already in print. Nor did my colleague think it necessary later to make any public avowal of his change of views on the subject of psychoanalysis; but preferred, in his capacity as a regular reviewer for a medical journal, to follow its development with flippant comments.[1]

Whatever personal sensitiveness I possessed became blunted during those years, to my advantage. I was saved from becoming embittered, however, by a circumstance which is not always present to help lonely discoverers. Such people are as a rule tormented by the need to account for the lack of sympathy or the aversion of their contemporaries, and feel this attitude as a distressing contradiction of the security of their own sense of conviction. There was no need for me to feel so; for psychoanalytic theory enabled me to understand this attitude in my contemporaries and to see it as a necessary consequence of fundamental analytic premises. If it was true that the set of facts I had discovered were kept from the knowledge of patients themselves by internal resistances of an affective kind, then these resistances would be

1 [A sequel to this anecdote can be found at the beginning of Section V of Freud's *Autobiographical Study* (1925*d*), *RSE*, **20**, 42. According to Ernest Jones, the assistant in question was Emil Raimann, whose chief was Wagner-Jauregg. (See Jones, 1953, 395; 1955, 122–3.)]

[24] bound to appear in healthy people too, as soon as some external source confronted them with what was repressed. It was not surprising that they should be able to justify this rejection of my ideas on intellectual grounds though it was actually affective in origin. The same thing happened equally often with patients; the arguments they advanced were the same and were not precisely brilliant. In Falstaff's words, reasons are 'as plenty as blackberries'.[1] The only difference was that with patients one was in a position to bring pressure to bear on them so as to induce them to get insight into their resistances and overcome them, whereas one had to do without this advantage in dealing with people who were ostensibly healthy. How to compel these healthy people to examine the matter in a cool and scientifically objective spirit was an unsolved problem which was best left to time to clear up. In the history of science one can clearly see that often the very proposition which has at first called out nothing but contradiction has later come to be accepted, although no new proofs in support of it have been brought forward.

It was hardly to be expected, however, that during the years when I alone represented psychoanalysis I should develop any particular respect for the world's opinion or any bias towards intellectual appeasement.

1 [*Henry IV*, *Part I*, Act II, Scene, 4.]

II

From the year 1902 onwards, a number of young doctors gathered round [25]
me with the express intention of learning, practising and spreading the knowledge of psychoanalysis. The stimulus came from a colleague who had himself experienced the beneficial effects of analytic therapy.[1] Regular meetings took place on certain evenings at my house, discussions were held according to certain rules and the participants endeavoured to find their bearings in this new and strange field of research and to interest others in it. One day a young man who had passed through a technical training college introduced himself with a manuscript which showed very unusual comprehension. We persuaded him to go through the *Gymnasium* [secondary school] and the university and to devote himself to the non-medical side of psychoanalysis. The little society acquired in him a zealous and dependable secretary and I gained in Otto Rank a most loyal helper and co-worker.[2]

The small circle soon expanded, and in the course of the next few years often changed its composition. On the whole I could tell myself that it was hardly inferior, in wealth and variety of talent, to the staff of any clinical teacher one could think of. It included from the beginning the men who were later to play such a considerable, if not always a welcome, part in the history of the psychoanalytic movement. At that time, however, one could not yet guess at these developments. I had every reason to be satisfied, and I think I did everything possible to impart my own knowledge and experience to the others. There were only two inauspicious circumstances which at last estranged me inwardly from the group. I could not succeed in establishing among its members the friendly relations that ought to obtain between men who are all engaged upon the same difficult work; nor was I able to stifle the disputes about priority for which there were so many opportunities under these conditions of work in common. The difficulties in the way of giving instruction in the [26]
practice of psychoanalysis, which are quite particularly great and are responsible for much in the present dissensions, were evident already in this private Vienna Psychoanalytical Society. I myself did not venture to put forward a still unfinished technique and a theory still in the making

1 [Wilhelm Stekel.]

2 [*Footnote added* 1924:] Now director of the Internationaler Psychoanalytischer Verlag [International Psychoanalytical Publishing House, see 1919*c*; *RSE*, **17**, 259–60] and editor of the *Zeitschrift* and *Imago* from their inception [see below, p. 42].

with an authority which would probably have enabled the others to avoid some wrong turnings and ultimate disasters. The self-reliance of intellectual workers, their early independence of their teacher, is always gratifying from a psychological point of view; but it is only of advantage to science if those workers fulfil certain personal conditions which are none too common. For psychoanalysis in particular a long and severe discipline and training in self-discipline would have been required. In view of the courage displayed by their devotion to a subject so much frowned upon and so poor in prospects, I was disposed to tolerate much among the members to which I should otherwise have made objection. Besides doctors, the circle included others – men of education who had recognized something important in psychoanalysis: writers, painters and so on. My *Interpretation of Dreams* and my book on jokes, among others, had shown from the beginning that the theories of psychoanalysis cannot be restricted to the medical field, but are capable of application to a variety of other mental sciences.

In 1907 the situation changed all at once and contrary to all expectations. It appeared that psychoanalysis had unobtrusively awakened interest and gained friends, and that there were even some scientific workers who were ready to acknowledge it. A communication from Bleuler[1] had informed me before this that my works had been studied and made use of in the Burghölzli. In January, 1907, the first member of the Zürich clinic came to Vienna – Dr Eitingon.[2] Other visits followed, which led to an animated exchange of ideas. Finally, on the invitation of C. G. Jung, at that time still assistant physician at the Burghölzli, a first meeting took place at Salzburg in the spring of 1908, which brought together friends of
[27] psychoanalysis from Vienna, Zürich and other places. One of the results of this first Psychoanalytical Congress was the founding of a periodical called the *Jahrbuch für psychoanalytische und psychopathologische Forschungen* [see below, p. 41], under the direction of Bleuler and Freud and edited by Jung, which first appeared in 1909. This publication gave expression to an intimate cooperation between Vienna and Zürich.

I have repeatedly acknowledged with gratitude the great services rendered by the Zürich school of Psychiatry in the spread of psychoanalysis, particularly by Bleuler and Jung, and I have no hesitation in doing so again, even in the greatly altered circumstances of the present. True, it

1 [Eugen Bleuler (1857–1939), the well-known psychiatrist, then head of the Burghölzli, the public mental hospital at Zürich.]

2 [*Footnote added* 1924:] The subsequent founder of the 'Psychoanalytic Policlinic' in Berlin. [See two short notes on this by Freud (1923*g*), *RSE*, **19**, and (1930*b*), ibid., **21**.]

was not the support of the Zürich school which first directed the attention of the scientific world to psychoanalysis at that time. What had happened was that the latency period had expired and everywhere psychoanalysis was becoming the object of ever-increasing interest. But in all other places this accession of interest at first produced nothing but a very emphatic repudiation, mostly a quite passionate one; whereas in Zürich, on the contrary, agreement on general lines was the dominant note. Moreover, nowhere else did such a compact little group of adherents exist, or could a public clinic be placed at the service of psychoanalytic researches, or was there a clinical teacher who included psychoanalytic theories as an integral part of his psychiatric course. The Zürich group thus became the nucleus of the small band who were fighting for the recognition of analysis. The only opportunity of learning the new art and working at it in practice lay there. Most of my followers and co-workers at the present time came to me by way of Zürich, even those who were geographically much nearer to Vienna than to Switzerland. In relation to Western Europe, which contains the great centres of our culture, the position of Vienna is an outlying one; and its prestige has for many years been affected by strong prejudices. Representatives of all the most important nations congregate in Switzerland, where intellectual activity is so lively; a focus of infection there was bound to be of great importance for the spread of the 'psychical epidemic', as Hoche of Freiburg has called it.[1]

According to the evidence of a colleague who witnessed developments [28]
at the Burghölzli, it appears that psychoanalysis awakened interest there very early. In Jung's work on occult phenomena, published in 1902, there was already an allusion to my book on dream interpretation. From 1903 or 1904, says my informant, psychoanalysis was at the forefront of interest. After personal relations between Vienna and Zürich had been established, an informal society was also started, in the middle of 1907, in the Burghölzli, where the problems of psychoanalysis were discussed at regular meetings. In the alliance between the Vienna and Zürich schools the Swiss were by no means mere recipients. They had already produced very creditable scientific work, the results of which were of service to psychoanalysis. The association experiments started by the Wundt school had been interpreted by them in a psychoanalytic sense, and had proved applicable in unexpected ways. By this means it had become possible to arrive at rapid experimental confirmation of psychoanalytic

1 [Alfred Hoche (1865–1943), Professor of Psychiatry at Freiburg, was particularly vehement and abusive in his attacks on psychoanalysis. He read a paper on it at a medical congress at Baden-Baden with the title 'A Psychical Epidemic among Doctors'. (Hoche, 1910.)]

observations and to demonstrate directly to students certain connections which an analyst would only have been able to tell them about. The first bridge linking up experimental psychology with psychoanalysis had been built.

In psychoanalytic treatment, association experiments enable a provisional, qualitative analysis of the case to be made, but they furnish no essential contribution to the technique and can be dispensed with in carrying out analyses. More important, however, was another achievement by the Zürich school, or its leaders, Bleuler and Jung. The former showed that light could be thrown on a large number of purely psychiatric cases by adducing the same processes as have been recognized through psychoanalysis to obtain in dreams and neuroses (Freudian mechanisms); and Jung [1907] successfully applied the analytic method of interpretation to the most alien and obscure phenomena of dementia praecox [schizophrenia], so that their sources in the life history and interests of the patient came clearly to light. After this it was impossible for psychiatrists to ignore psychoanalysis any longer. Bleuler's great work on schizophrenia (1911), in which the psychoanalytic point of view was placed on an equal footing with the clinical systematic one, completed this success.

[29] I will not omit to point out a divergence which was already at that time noticeable in the direction taken by the work of the two schools. As early as in 1897[1] I had published the analysis of a case of schizophrenia, which however was of a paranoid character, so that the solution to it could not take away from the impression made by Jung's analyses. But to me the important point had been, not so much the possibility of interpreting the symptoms, as the psychical mechanism of the disease, and above all the agreement of this mechanism with that of hysteria, which had already been discovered. At that time no light had yet been thrown on the differences between the two mechanisms. For I was then already aiming at a libido theory of the neuroses, which was to explain all neurotic and psychotic phenomena as proceeding from abnormal vicissitudes [*Schicksalen*] of the libido, that is, as diversions from its normal employment. This point of view was missed by the Swiss investigators. As far as I know, even today Bleuler maintains the view that the various forms of dementia praecox have an organic causation; and at the Salzburg Congress in 1908 Jung, whose book on this disease had appeared in

1 [This wrong date appears in all the German editions. The case was published in May, 1896. It occupies Section III of Freud's second paper on 'The Neuropsychoses of Defence' (1896*b*), *RSE*, **3**, 183 ff.]

1907, supported the toxic theory of its causation, which takes no account of the libido theory, although it is true that it does not rule it out. Later on (1912) he came to grief[1] on this same point, by making too much of the material which he had previously refused to employ.

There is a third contribution made by the Swiss school, probably to be ascribed entirely to Jung, which I do not value so highly as others do whose concern with these matters is more remote. I refer to the theory of 'complexes' which grew out of the *Diagnostische Assoziationsstudien* [*Studies in Word-Association*] (1906). It has neither itself produced a psychological theory, nor has it proved capable of easy incorporation into the context of psychoanalytic theory. The word 'complex', on the other hand, has become naturalized, so to speak, in psychoanalytic language; it is a convenient and often indispensable term for summing up a psychological state descriptively.[2] None of the other terms coined by [30]
psychoanalysis for its own needs has achieved such widespread popularity or been so misapplied to the detriment of the construction of clearer concepts. Analysts began to speak among themselves of a 'return of a complex' where they meant a 'return of the repressed', or fell into the habit of saying 'I have a complex against him', where the only correct expression would have been 'a resistance against him'.

In the years following 1907, when the schools of Vienna and Zürich were united, psychoanalysis made the extraordinary surge forward of which the momentum is felt even today; this is shown both by the spread of psychoanalytic literature and by the constant increase in the number of doctors who are practising or studying it, as well as by the frequency of the attacks made on it at congresses and in learned societies. It has penetrated into the most distant lands and has everywhere not merely startled psychiatrists but commanded the attention of the educated public and of scientific workers in other fields. Havelock Ellis, who has

1 [Grubrich-Simitis (1993, 216–17; trans., 170, slightly modified here) records that the following passage appears here in the manuscript which was omitted and replaced by the remainder of the sentence in the published version: 'When he for his part ultimately ventured to subject schizophrenia to the libido theory, he deviated in the opposite direction and modified the concept of libido to such an extent that his libido theory has nothing other than the name in common with the one developed previously. But even the name is illegitimate, as there was no need to use the word "libido" for the principle by which he wanted to elucidate schizophrenia dynamically. This appropriation of the name, however minor it might appear as a symptomatic act, was a product of that character trait in Jung which rendered it impossible to maintain the working relationship with him: his tendency to ruthlessly thrust aside an inconvenient other.']

2 [Freud seems to have first borrowed the term from Jung in a paper on evidence in legal proceedings (1906*c*), *RSE*, **9**. He himself, however, had used the word in what seems a very similar sense long before, in a footnote to the case of Frau Emmy von N. in *Studies on Hysteria* (1895*d*), ibid., **2**, 62 *n*.]

followed its development with sympathy though without ever calling himself an adherent, wrote in 1911 in a report for the Australasian Medical Congress: 'Freud's psychoanalysis is now championed and carried out not only in Austria and in Switzerland, but in the United States, in England, in India, in Canada, and, I doubt not, in Australasia.'[1] A physician from Chile (probably a German) spoke at the International Congress at Buenos Aires in 1910 in support of the existence of infantile sexuality and commended highly the effects of psychoanalytic therapy on obsessional symptoms.[2] An English neurologist in Central India (Berkeley-Hill[3]) informed me, through a distinguished colleague who was visiting Europe, that the analyses of Mohammedan Indians which he had carried out showed that the aetiology of their neuroses was no different from what we find in our European patients.

[31] The introduction of psychoanalysis into North America was accompanied by very special marks of honour. In the autumn of 1909, Stanley Hall, the President of Clark University, Worcester, Massachusetts, invited Jung and myself to take part in the celebration of the twentieth anniversary of the foundation of the university by giving a number of lectures in German. To our great surprise, we found the members of that small but highly esteemed university for the study of education and philosophy so unprejudiced that they were acquainted with all the literature of psychoanalysis and had given it a place in their lectures to students. In prudish America it was possible, in academic circles at least, to discuss freely and scientifically everything that in ordinary life is regarded as objectionable. The five lectures which I improvised in Worcester appeared in an English translation in the *American Journal of Psychology* [1910*a*], and were shortly afterwards published in German under the title *Über Psychoanalyse*. Jung read a paper on diagnostic association experiments and another on conflicts in the mind of the child.[4] We were rewarded with the honorary degree of Doctor of Laws. During that week of celebrations at Worcester, psychoanalysis was represented by five men: besides Jung and myself, there were Ferenczi, who had joined me for the journey, Ernest Jones, then at the University of Toronto (Canada) and now in London, and A. A. Brill, who was already practising psychoanalysis in New York.

1 Havelock Ellis, 1911*b*. [Freud himself contributed a paper to the same Congress in Sydney (1913*m* [1911]), *RSE*, **12**.]

2 G. Greve, 1910. [Freud wrote a review of this (1911*g*), ibid., **11**.]

3 [The name was added in 1924.]

4 [Jung, 1910*a* and 1910*b*.]

The most important personal relationship which arose from the meeting at Worcester was that with James J. Putnam, Professor of Neuropathology at Harvard University. Some years before, he had expressed an unfavourable opinion of psychoanalysis, but now he rapidly became reconciled to it and recommended it to his countrymen and his colleagues in a series of lectures which were as rich in content as they were brilliant in form. The esteem he enjoyed throughout America on account of his high moral character and unflinching love of truth was of great service to psychoanalysis and protected it against the denunciations which in all probability would otherwise quickly have overwhelmed it. Later on, yielding too much to the strong ethical and philosophical bent of his nature, Putnam made what seems to me an impossible demand – he expected psychoanalysis to place itself at the service of a particular moral-philosophical conception of the universe – but he remains the chief pillar of the psychoanalytic movement in his native land.[1] [32]

For the further spread of this movement Brill and Jones deserve the greatest credit: in their writings they drew their countrymen's attention with unremitting assiduity to the easily observable fundamental facts of everyday life, of dreams and neurosis. Brill has contributed still further to this effect by his medical practice and by his translations of my works, and Jones by his instructive lectures and by his skill in debate at congresses in America.[2] The absence of any deep-rooted scientific tradition in America and the much less stringent rule of official authority there have been of decided advantage to the impetus given by Stanley Hall. It was characteristic of that country that from the beginning professors and superintendents of mental hospitals showed as much interest in analysis as independent practitioners. But it is clear that precisely for this reason the ancient centres of culture, where the greatest resistance has been displayed, must be the scene of the decisive struggle over psychoanalysis.

Among European countries France has hitherto shown itself the least disposed to welcome psychoanalysis, although useful work in French by A. Maeder of Zürich has provided easy access to its theories. The first indications of sympathy came from the provinces: Morichau-Beauchant (Poitiers) was the first Frenchman to adhere publicly to psychoanalysis, Régis[3] & Hesnard (Bordeaux) have recently [1914] attempted to disperse

1 [*Footnote added* 1924:] See Putnam's *Addresses on Psycho-Analysis*, 1921. [Freud contributed a Preface to this (1921*a*), *RSE*, **18**.] – Putnam died in 1918. [See Freud's obituary of him (1919*b*), ibid., **17**.]

2 The publications of both authors have appeared in collected volumes: Brill, 1912, and Ernest Jones, 1913*a*.

3 [E. Régis (1855–1918) was Professor of Psychiatry at Bordeaux from 1905.]

the prejudices of their countrymen against the new ideas by an exhaustive presentation, which, however, is not always understanding and takes special exception to symbolism.[1] In Paris itself, a conviction still seems to reign (to which Janet himself gave eloquent expression at the Congress[2] in London in 1913) that everything good in psychoanalysis is a repetition
[33] of Janet's views with insignificant modifications, and that everything else in it is bad. At this Congress itself, indeed, Janet had to submit to a number of corrections by Ernest Jones, who was able to point out to him his insufficient knowledge of the subject.[3] Even though we deny his claims, however, we cannot forget the value of his work on the psychology of the neuroses.

In Italy, after several promising starts, no real interest was forthcoming. To Holland analysis found early access through personal connections: Van Emden, Van Ophuijsen, Van Renterghem (*Freud en zijn School* [1913]) and the two Stärckes are actively occupied with it both in practice and theory.[4] In scientific circles in England interest in analysis has developed very slowly, but there is reason to expect that the sense for the practical and the passionate love of justice in the English will ensure it a brilliant future there.

In Sweden, P. Bjerre, who succeeded to Wetterstrand's practice, gave up hypnotic suggestion, at least for the time, in favour of analytic treatment. R. Vogt (Christiania) had already shown an appreciation of psychoanalysis in his *Psykiatriens grundtraek*, published in 1907; so that the first textbook of psychiatry to refer to psychoanalysis was written in Norwegian. In Russia, psychoanalysis has become generally known and has spread widely; almost all my writings, as well as those of other adherents of analysis, have been translated into Russian. But a really penetrating comprehension of analytic theories has not yet been evinced in Russia; so that the contributions of Russian physicians are at present not very notable. The only trained analyst there is M. Wulff who practises in Odessa. It is principally due to L. Jekels that psychoanalysis has been introduced to Polish scientific and literary circles. Hungary, so near geographically to Austria, and so far from it scientifically, has produced

1 [Before 1924 this read 'an exhaustive and understanding presentation which only took exception to symbolism'.]

2 [The International Medical Congress.]

3 [Cf. Janet (1913) and Jones (1915), also an Editors' footnote to *Studies on Hysteria* (Breuer & Freud, 1895*d*), *RSE*, **2**, xvi *n.* 1.]

4 The first *official* recognition of dream interpretation and psychoanalysis in Europe was extended to them by the psychiatrist Jelgersma, Rector of the University of Leyden, in his rectorial address on February 9, 1914.

only one collaborator, S. Ferenczi, but one that indeed outweighs a whole society.[1]

As regards the position of psychoanalysis in Germany, it can only be [34]
said that it forms the centre point of scientific discussions and provokes the most emphatic expressions of disagreement both among doctors and laymen; these are not yet at an end, but are constantly flaring up again, sometimes with greater intensity. No official educational bodies there have up to now recognized psychoanalysis. Successful practitioners who employ it are few; only a few institutions, such as Binswanger's in Kreuzlingen (on Swiss soil) and Marcinowski's in Holstein, have opened their doors to it. One of the most prominent representatives of analysis, Karl Abraham, at one time an assistant of Bleuler's, maintains himself in the critical atmosphere of Berlin. One might wonder that this state of things should have continued unaltered for several years if one did not know that the account I have given only represents external appearances. Too much significance should not be attributed to rejection by the official representatives of science and heads of institutions, and by the followers dependent on them. It is natural that its opponents should give loud expression to their views, while its intimidated adherents keep silence. Some of the latter, whose first contributions to analysis raised favourable expectations, have later withdrawn from the movement under the pressure of circumstances. The movement itself advances surely though silently; it is constantly gaining new adherents among [35]
psychiatrists and laymen, it brings in a growing stream of new readers for psychoanalytic literature and for that very reason drives its opponents to ever more violent defensive efforts. At least a dozen times in recent

1 [*Footnote added* 1923:] It is not my intention, of course, to bring this account, written in 1914, 'up to date' [in English in the original]. I will add only a few remarks to indicate how the picture has altered in the interval, which includes the World War. In Germany a gradual infiltration of analytic theories into clinical psychiatry is taking place, though this is not always admitted. The French translations of my works that have been appearing during the last few years have finally aroused a keen interest in psychoanalysis even in France, though for the moment this is more active in literary circles than in scientific ones. In Italy M. Levi Bianchini (of Nocera Superiore) and Edoardo Weiss (of Trieste) have come forward as translators and champions of psychoanalysis (cf. the *Biblioteca Psicoanalitica Italiana*). A collected edition of my works which is appearing in Madrid (translated by López Ballesteros) is evidence of the lively interest taken in it in Spanish-speaking countries (Prof. H. Delgado in Lima). As regards England, the prophecy which I have made above seems to be in steady course of fulfilment; a special centre for the study of analysis has been formed at Calcutta in British India. In North America it is still true that the depth of understanding of analysis does not keep pace with its popularity. In Russia, since the Revolution, psychoanalytic work has begun afresh at several centres. In Poland the *Polska Bibljoteka Psychoanalityczna* is now appearing. In Hungary a brilliant analytic school is flourishing under the leadership of Ferenczi. (Cf. the Festschrift issued in honour of his fiftieth birthday [which included an appreciation by Freud (1923*i*), *RSE*, **19**].) At the present time the Scandinavian countries are still the least receptive.

years, in reports of the proceedings of certain congresses and scientific bodies or in reviews of certain publications, I have read that now psychoanalysis is dead, defeated and disposed of once and for all. The best answer to all this would be in the terms of Mark Twain's telegram to the newspaper which had falsely published news of his death: 'Report of my death greatly exaggerated.' After each of these obituaries psychoanalysis regularly gained new adherents and co-workers or acquired new channels of publicity. After all, being declared dead was an advance on being buried in silence.

Hand in hand with this expansion of psychoanalysis in space went an expansion in content; it extended from the field of the neuroses and psychiatry to other fields of knowledge. I shall not treat this aspect of the development of our discipline in much detail, since this has been done with great success by Rank & Sachs [1913] in a volume (one of Löwenfeld's *Grenzfragen*) which deals exhaustively with precisely this side of analytic research. Moreover, this development is still in its infancy; it has been little worked at, consists mostly of tentative beginnings and in part of no more than plans. No reasonable person will see any grounds for reproach in this. An enormous mass of work confronts a small number of workers, most of whom have their main occupation elsewhere and can bring only the qualifications of an amateur to bear on the technical problems of these unfamiliar fields of science. These workers, who derive from psychoanalysis, make no secret of their amateurishness. Their aim is merely to act as signposts and stopgaps for the specialists, and to put the analytic technique and principles at their disposal against a time when they in turn shall take up the work. That the results achieved are nevertheless not inconsiderable is due partly to the fruitfulness of the analytic method, and partly to the circumstance that there are already a few investigators who are not doctors, and have taken up the application of psychoanalysis to the human sciences [*Geisteswissenschaften*] as their profession in life.

Most of these applications of analysis naturally go back to a hint in my
[36] earliest analytic writings. The analytic examination of neurotic people and the neurotic symptoms of normal people necessitated the assumption of psychological conditions which could not possibly be limited to the field in which they had been discovered. In this way analysis not only provided us with the explanation of pathological phenomena, but revealed their connection with normal mental life and disclosed unsuspected relationships between psychiatry and the most various other

sciences dealing with activities of the mind. Certain typical dreams, for instance, yielded an explanation of some myths and fairy tales. Riklin [1908] and Abraham [1909] followed this hint and initiated the researches into myths which have found their completion, in a manner complying with even expert standards, in Rank's works on mythology [e.g. 1909, 1911*e*]. Further investigation into dream symbolism led to the heart of the problems of mythology, folklore (Jones [e.g. 1910*c* and 1912*d*] and Storfer [1914*b*]) and the abstractions of religion. A deep impression was made on the audience at one of the Psychoanalytical Congresses when a follower of Jung's demonstrated the correspondence between schizophrenic phantasies [*Phantasiebildungen*] and the cosmogonies of primitive times and races.[1] Mythological material later received further elaboration (which, though open to criticism, was nonetheless very interesting) at the hands of Jung, in works attempting to correlate the neuroses with religious and mythological phantasies.

Another path led from the investigation of dreams to the analysis of works of imagination [*dichterischen Schöpfungen*] and ultimately to the analysis of their creators – writers and artists themselves. At an early stage it was discovered that dreams invented by writers will often yield to analysis in the same way as genuine ones. (Cf. 'Gradiva' [1907*a*].) The conception of unconscious mental activity made it possible to form a preliminary idea of the nature of imaginative creative writing; and the realization, gained in the study of neurotics, of the part played by drive impulses enabled us to perceive the sources of artistic production and confronted us with two problems: how the artist reacts to this instigation and what means he employs to disguise his reactions.[2] Most analysts with general interests have contributed something to the solution to [37]
these problems, which are the most fascinating among the applications of psychoanalysis. Naturally, opposition was not lacking in this direction either on the part of people who knew nothing of analysis; it took the same form as it did in the original field of psychoanalytic research – the same misconceptions and vehement rejections. It was only to be expected from the beginning that, whatever the regions into which psychoanalysis might penetrate, it would inevitably experience the same struggles with those already in possession of the field. These attempted invasions, however, have not yet stirred up the attention in some quarters which awaits

1 [Jan Nelken at the Weimar Congress in 1911. An expanded version of the paper can be found in Nelken, 1912.]

2 Cf. Rank's *Der Künstler* [*The Artist*, 1907], analyses of imaginative writers by Sadger [1909*b*], Reik [1912, etc.], and others, my own small work on a childhood memory of Leonardo da Vinci's [1910*c*; *RSE*, **11**], and Abraham's analysis of Segantini [1911*b*].

them in the future. Among the strictly scientific applications of analysis to literature, Rank's exhaustive work on the theme of incest [1912*c*] easily takes first place. Its subject is bound to arouse the greatest unpopularity. Up to the present, little work based on psychoanalysis has been done in the sciences of language and history. I myself ventured the first approach to the problems of the psychology of religion by drawing a parallel between religious ritual and the ceremonials of neurotics (1907*b*).[1] Dr Pfister, a pastor in Zürich, has traced back the origin of religious fanaticism to perverse eroticism in his book on the piety of Count von Zinzendorf [1910], as well as in other contributions. In the latest works of the Zürich school, however, we find analysis permeated with religious ideas rather than the opposite outcome that had been in view.

In the four essays with the title *Totem and Taboo* [1912–13*a*; *RSE*, **13**] I have made an attempt to deal with the problems of social anthropology in the light of analysis; this line of investigation leads directly to the origins of the most important institutions of our civilization [*Kultur-*
Kultur *institutionen*][T], of the structure of the state, of morality and religion, and, moreover, of the prohibition against incest and of conscience. It is no doubt too early to decide how far the conclusions thus reached will be able to withstand criticism.[2]

The first example of an application of the analytic mode of thought to the problems of aesthetics was contained in my book on jokes [1905*c*; *RSE*, **8**]. Everything beyond this is still awaiting workers, who may expect
[38] a particularly rich harvest in this field. We are entirely without the cooperation of specialists in all these branches of knowledge, and in order to attract them Hanns Sachs, in 1912, founded the periodical *Imago* which is edited by him and Rank. A beginning has been made by Hitschmann and von Winterstein in throwing psychoanalytic light on philosophical systems and personalities, and here there is much need both of extended and of deeper investigation.

The revolutionary discoveries of psychoanalysis in regard to the mental life of children – the part played in it by sexual impulses (von Hug-Hellmuth [1913*b*]), and the fate of those components of sexuality which become unserviceable in the function of reproduction – were bound early to direct attention to education and to stimulate an

1 [All the German editions give this date wrongly as 1910.]

2 [Grubrich-Simitis (1993, 222; trans., 174, slightly modified here) notes that the emotive continuation of this sentence in the manuscript was suppressed in the printed version: 'but I can surely dismiss as harmless nonsense objections such as one I have heard to the effect that wild horses, under analogous conditions of family formation, do not behave in accordance with my assumption regarding primal man.']

attempt to bring analytic points of view into the foreground in that field of work. Recognition is due to Dr Pfister for having, with sincere enthusiasm, initiated the application of psychoanalysis in this direction and brought it to the notice of ministers of religion and those concerned with education. (Cf. *The Psychoanalytic Method*, 1913*b*.[1]) He has succeeded in gaining the sympathy and participation of a number of Swiss teachers in this. Other members of his profession are said to share his views but to have preferred nevertheless to remain cautiously in the background. In their retreat from psychoanalysis, a section of Vienna analysts seem to have arrived at a kind of combination of medicine and education.[2]

With this incomplete outline I have attempted to give some idea of the still incalculable wealth of connections which have come to light between medical psychoanalysis and other fields of science. There is material here for a generation of investigators to work at, and I do not doubt that the work will be carried out as soon as the resistances against psychoanalysis are overcome on its original ground.[3]

To write the story of these resistances would, I think, be both fruitless and inopportune at the present time. The story is not very creditable to the scientific men of our day. But I must add at once that it has never occurred to me to pour contempt upon the opponents of psychoanalysis merely because they were opponents – apart from the few unworthy [39] individuals, the adventurers and profiteers, who are always to be found on both sides in time of war. I knew very well how to account for the behaviour of these opponents and, moreover, I had learnt that psychoanalysis brings out the worst in everyone. But I made up my mind not to answer my opponents and, so far as my influence went, to restrain others from polemics. Under the peculiar conditions of the controversy over psychoanalysis it seemed to me very doubtful whether either public or written discussion would avail anything; it was certain which way the majority at congresses and meetings would go, and my faith in the reasonableness and good behaviour of the gentlemen who opposed me was not at any time great. Experience shows that only very few people are capable of remaining polite, to say nothing of objective, in a scientific dispute, and the impression made on me by scientific squabbles has always been odious. Perhaps this attitude on my part has been

1 [Freud wrote an Introduction to this (1913*b*), *RSE*, **12**.]

2 Adler & Furtmüller, *Heilen und Bilden* [*Healing and Educating*], 1914.

3 See my two articles in *Scientia* (1913*j*) [*RSE*, **13**].

misunderstood; perhaps I have been thought so good-natured or so easily intimidated that no further notice need be taken of me. This was a mistake; I can be as abusive and enraged as anyone; but I have not the art of expressing the underlying emotions in a form suitable for publication and I therefore prefer to abstain completely.

Perhaps in some respects it would have been better if I had given free rein to my own passions and to those of others round me. We have all heard of the interesting attempt to explain psychoanalysis as a product of the Vienna milieu. As recently as in 1913 Janet was not ashamed to use this argument, although he himself is no doubt proud of being a Parisian, and Paris can scarcely claim to be a city of stricter morals than Vienna.[1] The suggestion is that psychoanalysis, and in particular its assertion that the neuroses are traceable to disturbances in sexual life, could only have originated in a town like Vienna – in an atmosphere of sensuality and immorality foreign to other cities – and that it is simply a reflection, a projection into theory, as it were, of these peculiar Viennese conditions. Now I am certainly no local patriot; but this theory about psychoanalysis always seems to me quite exceptionally senseless – so senseless, in fact, that I have sometimes been inclined to suppose that the
[40] reproach of being a citizen of Vienna is only a euphemistic substitute for another reproach which no-one would care to put forward openly.[2] If the premises on which the argument rests were the opposite of what they are, then it might be worth giving it a hearing. If there were a town in which the inhabitants imposed exceptional restrictions on themselves as regards sexual satisfaction, and if at the same time they exhibited a marked tendency to severe neurotic disorders, that town might certainly give rise in an observer's mind to the idea that the two circumstances had some connection with each other, and might suggest that one was contingent on the other. But neither of these assumptions is true of Vienna. The Viennese are no more abstinent and no more neurotic than the inhabitants of any other capital city. There is rather less embarrassment – less prudery – in regard to sexual relationships than in the cities of the West and North which are so proud of their chastity. These peculiar characteristics of Vienna would be more likely to mislead the observer on the causation of neurosis than to enlighten him on it.

Vienna has done everything possible, however, to deny her share in the origin of psychoanalysis. In no other place is the hostile indifference of the learned and educated section of the population so evident to the analyst as in Vienna.

1 [The last clause of this sentence was added in 1924.]

2 [Presumably Freud's Jewish origin.]

It may be that my policy of avoiding wide publicity is to some extent responsible for this. If I had encouraged or allowed the medical societies of Vienna to occupy themselves with psychoanalysis in stormy debates which would have discharged all the passions and brought into the open all the reproaches and invectives that were on its opponents' tongues or in their hearts – then, perhaps, the ban on psychoanalysis would have been overcome by now and it would no longer be a stranger in its native city. As it is, the poet may be right when he makes his Wallenstein say:

> Doch das vergeben mir die Wiener nicht,
> dass ich um ein Spektakel sie betrog.[1]

The task to which I was not equal – that of demonstrating to the opponents of psychoanalysis *suaviter in modo* their injustice and arbitrariness – was undertaken and carried out most creditably by [41]
Bleuler in a paper written in 1910, 'Freud's Psychoanalysis: A Defence and Some Critical Remarks'. It would seem so natural for me to praise this work (which offers criticisms in both directions) that I will hasten to say what I take exception to in it. It seems to me still to display partiality, to be too lenient to the faults of the opponents of psychoanalysis and too severe on the shortcomings of its adherents. This trait in it may possibly explain why the opinion of a psychiatrist of such high repute, such undoubted ability and independence, failed to carry more weight with his colleagues. The author of *Affectivity* (1906*a*) ought not to be surprised if the influence of a work is determined not by the strength of its arguments but by its affective tone. Another part of its influence – its influence on the followers of psychoanalysis – was destroyed later by Bleuler himself, when in 1913 he showed the reverse side of his attitude to psychoanalysis in his 'Criticism of the Freudian Theory'. In that paper he subtracts so much from the structure [*Gebäude*] of psychoanalytic theory that our opponents may well be glad of the help given them by this champion of psychoanalysis. These adverse judgements of Bleuler's, however, are not based on new arguments or better observations. They rely simply on the state of his own knowledge, the inadequacy of which he no longer himself admits, as he did in his earlier works. It seemed therefore that an almost irreparable loss threatened psychoanalysis here. But in his last publication, 'Criticisms of my *Schizophrenia*' (1914), Bleuler rallies his forces in the face of the attacks made on him for having introduced psychoanalysis into his book on schizophrenia, and makes what he

1 [Literally 'But what the Viennese will not forgive me is having cheated them out of a spectacle.' Schiller, *Die Piccolomini*, Act II, Scene 7.]

himself calls a 'presumptuous claim'. 'But now I will make a presumptuous claim: I consider that up to the present the various schools of psychology have contributed extremely little towards explaining the nature of psychogenic symptoms and diseases, but that depth psychology offers something towards a psychology which still awaits creation and which physicians are in need of in order to understand their patients and to cure them rationally; and I even believe that in my *Schizophrenia* I have taken a very short step towards that understanding. The first two assertions are certainly correct; the last may be an error.'

Since by 'depth psychology' he means nothing else but psychoanalysis, we may for the present be content with this acknowledgement.

III

Mach es kurz!
Am Jüngsten Tag ist's nur ein Furz![1]
GOETHE

Two years after the first private Congress of psychoanalysts the second took place, this time at Nuremberg, in March, 1910. In the interval between them, influenced partly by the favourable reception in America, by the increasing hostility in German-speaking countries, and by the unforeseen acquisition of support from Zürich, I had conceived a project which with the help of my friend Ferenczi I carried out at this second Congress. What I had in mind was to organize the psychoanalytic movement, to transfer its centre to Zürich and to give it a chief who would look after its future career. As this scheme has met with much opposition among the adherents of psychoanalysis, I will set out my reasons for it in some detail. I hope that these will justify me, even though it turns out that what I did was in fact not very wise. [42]

I judged that the new movement's association with Vienna was no recommendation but rather a handicap to it. A place in the heart of Europe like Zürich, where an academic teacher had opened the doors of his institution to psychoanalysis, seemed to me much more promising. I also took it that a second handicap lay in my own person, opinion about which was too much confused by the liking or hatred of the different sides: I was either compared to Columbus,[2] Darwin and Kepler, or abused as a general paralytic. I wished, therefore, to withdraw into the background both myself and the city where psychoanalysis first saw the light. Moreover, I was no longer young; I saw that there was a long road ahead, and I felt oppressed by the thought that the duty of being a leader should fall to me so late in life.[3] Yet I felt that there must be [43]

1 [Literally 'Cut it short! On the Day of Judgement it is no more than a fart.' The lines occur in some ironic verses written late in Goethe's life (Grossherzog Wilhelm Ernst Ausgabe, **15**, 400–1). Satan is represented in them as bringing up a number of charges against Napoleon, and the words quoted by Freud are God the Father's reply. Freud had many years earlier (on December 4, 1896) quoted the same words in a letter to Fliess, as the suggested motto for a chapter on 'Resistance' (Freud, 1950*a*, Letter 51). Two possible explanations, not necessarily incompatible, may be offered for Freud's use of the quotation in the present connection. He may be applying the words to the criticisms put forward by the opponents of psychoanalysis, or he may be applying them ironically to himself for wasting his time on such trivialities. – It may also be remarked for the benefit of the non-German reader that '*Jüngsten Tag*' (literally 'last day') would not, in modern German, necessarily be spelt with a capital 'J'.]

2 [This name was added in 1924.]

3 [In 1910 Freud was 54.]

someone at the head. I knew only too well the pitfalls that lay in wait for anyone who became engaged in analysis, and hoped that many of them might be avoided if an authority could be set up who would be prepared to instruct and admonish. This position had at first been occupied by myself, owing to my fifteen years' start in experience which nothing could counterbalance. I felt the need of transferring this authority to a younger man, who would then as a matter of course take my place after my death. This man could only be C. G. Jung, since Bleuler was my contemporary in age; in favour of Jung were his exceptional talents, the contributions he had already made to psychoanalysis, his independent position and the impression of assured energy which his personality conveyed. In addition to this, he seemed ready to enter into a friendly relationship with me and for my sake to give up certain racial prejudices which he had previously permitted himself. I had no inkling at that time that in spite of all these advantages the choice was a most unfortunate one, that I had lighted upon a person who was incapable of tolerating the authority of another, but who was still less capable of wielding it himself, and whose energies were relentlessly devoted to the furtherance of his own interests.

I considered it necessary to form an official association because I feared the abuses to which psychoanalysis would be subjected as soon as it became popular. There should be some headquarters whose business it would be to declare: 'All this nonsense is nothing to do with analysis; this is not psychoanalysis.' At the sessions of the local groups (which together would constitute the international association) instruction should be given as to how psychoanalysis was to be conducted and doctors should be trained, whose activities would then receive a kind of guarantee.
[44] Moreover, it seemed to me desirable, since official science had pronounced its solemn ban upon psychoanalysis and had declared a boycott against doctors and institutions practising it, that the adherents of psychoanalysis should come together for friendly communication with one another and mutual support.

This and nothing else was what I hoped to achieve by founding the 'International Psychoanalytical Association'. It was probably more than could be attained. Just as my opponents were to discover that it was not possible to stem the tide of the new movement, so I was to find that it would not proceed in the direction I wished to mark out for it. The proposals made by Ferenczi in Nuremberg were adopted, it is true; Jung was elected President and made Riklin his Secretary; the publication of a bulletin which should link the Central Executive with the local groups

was resolved upon. The object of the Association was declared to be 'to foster and further the science of psychoanalysis founded by Freud, both as pure psychology and in its application to medicine and the human sciences; and to promote mutual support among its members in all endeavours to acquire and to spread psychoanalytic knowledge'. The scheme was strongly opposed only by the Vienna group. Adler, in great excitement, expressed the fear that 'censorship and restrictions on scientific freedom' were intended. Finally the Viennese gave in, after having secured that the seat of the Association should be not Zürich, but the place of residence of the President for the time being, who was to be elected for two years.

At this Congress three local groups were constituted: one in Berlin, under the chairmanship of Abraham; one in Zürich, whose head had become the President of the whole Association; and one in Vienna, the direction of which I made over to Adler. A fourth group, in Budapest, could not be formed until later. Bleuler had not attended the Congress on account of illness, and later he evinced hesitation about joining the Association on general grounds; he let himself be persuaded to do so, it is true, after a personal conversation with me, but resigned again shortly afterwards as a result of disagreements in Zürich. This severed the connection between the Zürich local group and the Burghölzli institution.

One outcome of the Nuremberg Congress was the founding of the *Zentralblatt für Psychoanalyse* [*Central Journal for Psychoanalysis*], for which purpose Adler and Stekel joined forces. It was obviously intended [45]
originally to represent the Opposition: it was meant to win back for Vienna the hegemony threatened by the election of Jung. But when the two founders of the journal, labouring under the difficulties of finding a publisher, assured me of their peaceful intentions and as a guarantee of their sincerity gave me a right of veto, I accepted the direction of it and worked energetically for the new organ; its first number appeared in September, 1910.

I will now continue the story of the Psychoanalytical Congresses. The third Congress took place in September, 1911, at Weimar, and was even more successful than the previous ones in its general atmosphere and scientific interest. J. J. Putnam, who was present on this occasion, declared afterwards in America how much pleasure it had given him and expressed his respect for 'the mental attitude' of those who attended it, quoting some words I was said to have used in reference to them: 'They have learnt to tolerate a bit of truth.' (Putnam, 1912*b*.) It is a fact that no-one who had attended scientific congresses could have failed to carry

away a favourable impression of the Psychoanalytical Association. I myself had conducted the first two Congresses and I had allowed every speaker time for his paper, leaving discussions to take place in private afterwards among the members. Jung, as President, took over the direction at Weimar and reintroduced formal discussions after each paper, which, however, did not give rise to any difficulties as yet.

A very different picture was presented by the fourth Congress, held in Munich two years later, in September, 1913. It is still fresh in the memory of all who were present. It was conducted by Jung in a disagreeable and incorrect manner; the speakers were restricted in time and the discussions overwhelmed the papers. By a malicious stroke of chance it happened that that evil spirit, Hoche,[1] had settled in the very building in which the meetings were held. Hoche would have had no difficulty in convincing himself of the nonsense which the analysts made of his description of them as a fanatical sect blindly submissive to their leader. The fatiguing and unedifying proceedings ended in the re-election of Jung to the Presidency of the International Psychoanalytical Association, which he accepted, although two-fifths of those present refused him their support. We dispersed without any desire to meet again.

[46] At about the time of this Congress the strength of the International Psychoanalytical Association was as follows. The local groups in Vienna, Berlin and Zürich had been formed at the Congress in Nuremberg as early as 1910. In May, 1911, a group at Munich under the chairmanship of Dr L. Seif was added. In the same year the first American local group was formed under the chairmanship of A. A. Brill, with the name 'The New York Psychoanalytic Society'. At the Weimar Congress the foundation of a second American group was authorized; it came into existence during the following year under the name of 'The American Psychoanalytic Association', and included members from Canada and the whole of America; Putnam was elected President and Ernest Jones Secretary. Shortly before the Congress in Munich in 1913, the Budapest local group was formed under the chairmanship of Ferenczi. Soon after this the first English group was formed by Ernest Jones, who had returned to London. The membership of these local groups, of which there were now eight, naturally affords no means of estimating the number of unorganized students and adherents of psychoanalyis.

The development of the periodicals devoted to psychoanalysis also deserves a brief mention. The first of these was a series of monographs

1 [See footnote, p. 23 above. In the manuscript Freud had originally intended to describe him as 'that filthy spirit' ('*der unsaubere Geist*'); the change was made at the instigation of Abraham (see Grubrich-Simitis, 1993, 215; trans., 169).]

entitled *Schriften zur angewandten Seelenkunde* [Papers on Applied Mental Science][1] which have appeared irregularly since 1907 and now number fifteen issues. (The publisher was to begin with Heller in Vienna and later F. Deuticke.) They comprise works by Freud (Nos. 1 and 7), Riklin, Jung, Abraham (Nos. 4 and 11), Rank (Nos. 5 and 13), Sadger, Pfister, Max Graf, Jones (Nos. 10 and 14), Storfer and von Hug-Hellmuth.[2] When the journal *Imago* (which will be referred to shortly [p. 42 below])[3] was founded, this form of publication ceased to have quite the same value. After the meeting at Salzburg in 1908, the *Jahrbuch für psychoanalytische und psychopathologische Forschungen* [*Yearbook for Psychoanalytic and Psychopathological Researches*] was founded, which appeared for five years under Jung's editorship and has now re-emerged, under two new editors[4] and with a slight change in its title, as the *Jahrbuch der Psychoanalyse* [*Yearbook of Psychoanalysis*]. It is no longer intended to be, as it has been in recent years, merely a repository [47]
for the publication of self-contained works. Instead, it will endeavour, through the activity of its editors, to fulfil the aim of recording all the work done and all the advances made in the sphere of psychoanalysis.[5] The *Zentralblatt für Psychoanalyse*, which, as I have already said, was started by Adler and Stekel after the foundation of the International Psychoanalytical Association in Nuremberg in 1910, has, during its short existence, had a stormy career. As early as in the tenth number of the first volume [July, 1911] an announcement appeared on the front page that, on account of scientific differences of opinion with the director, Dr Alfred Adler had decided to withdraw voluntarily from the editorship. After this Dr Stekel remained the only editor (from the summer of 1911). At the Weimar Congress [September, 1911] the *Zentralblatt* was raised to the position of official organ of the International Association and made available to all members in return for an increase in the annual subscription. From the third number of the second volume[6] onwards (winter [December], 1912) Stekel became solely responsible for its contents. His behaviour, of which it is not easy to publish an account, had compelled me to resign the direction and hurriedly to

1 [See Freud's prospectus for that series (1907*e*), *RSE*, **9**.]

2 [*Footnote added* 1924:] Since then, further works have appeared, by Sadger (Nos. 16 and 18) and Kielholz (No. 17).

3 [See also above, p. 32.]

4 [See above, p. 5 *n*. 2]

5 [*Footnote added* 1924:] It ceased publication at the beginning of the war [after only a single volume (1914) had been issued].

6 ['Second volume' in all former editions. It should in fact be 'third volume'. The volumes ran from October to September.]

establish a new organ for psychoanalysis – the *Internationale Zeitschrift für ärztliche Psychoanalyse* [*International Journal for Medical Psychoanalysis*]. The combined efforts of almost all our workers and of Hugo Heller, the new publisher, resulted in the appearance of the first number in January, 1913, whereupon it took the place of the *Zentralblatt* as official organ of the International Psychoanalytical Association.

Meanwhile, early in 1912, a new periodical, *Imago* (published by Heller), designed exclusively for the application of psychoanalysis to the human sciences, was founded by Dr Hanns Sachs and Dr Otto Rank. *Imago* is now in the middle of its third volume and is read with interest by a continually increasing number of subscribers, some of whom have little connection with medical analysis.[1]

[48] Apart from these four periodical publications (*Schriften zur angewandten Seelenkunde*, *Jahrbuch*, *Zeitschrift* and *Imago*) other German and foreign journals publish works which may claim a place in the literature of psychoanalysis. *The Journal of Abnormal Psychology*, directed by Morton Prince, usually contains so many good analytic contributions that it must be regarded as the principal representative of analytic literature in America. In the winter of 1913, White and Jelliffe in New York started a new periodical (*The Psychoanalytic Review*) which is devoted exclusively to psychoanalysis, no doubt bearing in mind the fact that most medical men in America who are interested in analysis find the German language a difficulty.[2]

I must now mention two secessions which have taken place among the adherents of psychoanalysis; the first occurred between the founding of the Association in 1910 and the Weimar Congress in 1911; the second took place after this and became manifest at Munich in 1913. The disappointment that they caused me might have been averted if I had paid more attention to the reactions of patients under analytic treatment. I knew very well of course that anyone may take to flight at his first approach to the unwelcome truths of analysis; I had always myself maintained that everyone's understanding of it is limited by his own

1 [*Footnote added* 1924:] The publication of these two periodicals was transferred in 1919 to the Internationaler Psychoanalytischer Verlag [the International Psychoanalytical Publishing House]. At the present time (1923) they are both in their ninth volume. (Actually, the *Internationale Zeitschrift* is in the eleventh and *Imago* in the twelfth year of its existence, but, in consequence of events during the war, Volume IV of the *Zeitschrift* covered more than one year, i.e. the years 1916–18, and Volume V of *Imago* the years 1917–18.) With the beginning of Volume VI the word '*ärztliche*' ['medical'] was dropped from the title of the *Internationale Zeitschrift*.

2 [*Footnote added* 1924:] In 1920 Ernest Jones undertook the founding of *The International Journal of Psycho-Analysis*, intended for readers in England and America.

repressions (or rather, by the resistances which sustain them) so that he cannot go beyond a particular point in his relation to analysis. But I had not expected that anyone who had reached a certain depth in his understanding of analysis could renounce that understanding and lose it. And yet daily experience with patients had shown that total rejection of analytic knowledge may result whenever a specially strong resistance arises at any depth in the mind; one may have succeeded in laboriously [49]
bringing a patient to grasp some parts of analytic knowledge and to handle them like possessions of his own, and yet one may see him, under the domination of the very next resistance, throw all he has learnt to the winds and stand on the defensive as he did in the days when he was a carefree beginner. I had to learn that the very same thing can happen with psychoanalysts as with patients in analysis.

It is no easy or enviable task to write the history of these two secessions, partly because I am without any strong personal motive for doing so – I had not expected gratitude nor am I revengeful to any effective degree – and partly because I know that by doing so I shall lay myself open to the invectives of my not too scrupulous opponents and offer the enemies of analysis the spectacle they so heartily desire – of 'the psychoanalysts tearing one another limb from limb'. After exercising so much self-restraint in not coming to blows with opponents outside analysis, I now see myself compelled to take up arms against its former followers or people who still like to call themselves its followers. I have no choice in the matter, however; only indolence or cowardice could lead one to keep silence, and silence would cause more harm than a frank revelation of the harms that already exist. Anyone who has followed the growth of other scientific movements will know that the same upheavals and dissensions commonly occur in them as well. It may be that elsewhere they are more carefully concealed; but psychoanalysis, which repudiates so many conventional ideals, is more honest in these matters too.

Another very severe drawback is that I cannot entirely avoid throwing some analytic light on these two opposition movements. Analysis is not suited, however, for polemical use; it presupposes the consent of the person who is being analysed and a situation in which there is a superior and a subordinate. Anyone, therefore, who undertakes an analysis for polemical purposes must expect the person analysed to use analysis against him in turn, so that the discussion will reach a state which entirely excludes the possibility of convincing any impartial third person. I shall therefore restrict to a minimum my use of analytic knowledge, and, with it, of indiscretion and aggressiveness towards my opponents; and I may

also point out that I am not basing any scientific criticism on these grounds. I am not concerned with the truth that may be contained in the
[50] theories which I am rejecting, nor shall I attempt to refute them. I shall leave that task to other qualified workers in the field of psychoanalysis, and it has, indeed, already been partly accomplished. I wish merely to show that these theories controvert the fundamental principles of analysis (and on what points they controvert them) and that for this reason they should not be known by the name of analysis. So I shall avail myself of analysis only in order to explain how these divergences from it could arise among analysts. When I come to the points at which the divergences occurred, I shall have, it is true, to defend the just rights of psychoanalysis with some remarks of a purely critical nature.

The first task confronting psychoanalysis was to explain the neuroses; it used the two facts of resistance and transference as starting points, and, taking into consideration the third fact of amnesia, accounted for them with its theories of repression, of the sexual drive forces in neurosis and of the unconscious. Psychoanalysis has never claimed to provide a complete theory of human mentality in general, but only expected that what it offered should be applied to supplement and correct the knowledge acquired by other means. Adler's theory, however, goes far beyond this point; it seeks at one stroke to explain the behaviour and character of human beings as well as their neurotic and psychotic illnesses. It is actually more suited to any other field than that of neurosis, although for reasons connected with the history of its development it still places this in the foreground. For many years I had opportunities of studying Dr Adler and have never refused to recognize his unusual ability, combined with a particularly speculative disposition. As an instance of the 'persecution' to which he asserts he has been subjected by me, I can point to the fact that after the Association was founded I made over to him the leadership of the Vienna group. It was not until urgent demands were put forward by all the members of the society that I let myself be persuaded to take the chair again at its scientific meetings. When I perceived how little gift Adler had precisely for judging unconscious material, my view changed to an expectation that he would succeed in discovering the connections of psychoanalysis with psychology and with the biological foundations of drive processes – an expectation
[51] which was in some sense justified by the valuable work he had done on 'organ inferiority'.[1] And he did, in fact, effect something of the kind; but

1 [Adler, 1907.]

his work conveys an impression 'as if' – to speak in his own 'jargon'[1] – it was intended to prove that psychoanalysis was wrong in everything and that it had only attributed so much importance to sexual driving forces because of its credulity in accepting the assertions of neurotics. I may even speak publicly of the personal motive for his work, since he himself announced it in the presence of a small circle of members of the Vienna group: 'Do you think it gives me such great pleasure to stand in your shadow my whole life long?' To be sure, I see nothing reprehensible in a younger man freely admitting his ambition, which one would in any case guess was among the incentives for his work. But even though a man is dominated by a motive of this kind he should know how to avoid being what the English, with their fine social tact, call 'unfair' – which in German can only be expressed by a much cruder word. How little Adler has succeeded in this is shown by the profusion of petty outbursts of malice which disfigure his writings and by the indications they contain of an uncontrolled craving for priority. At the Vienna Psychoanalytical Society we once actually heard him claim priority for the conception of the 'unity of the neuroses' and for the 'dynamic view' of them. This came as a great surprise to me, for I had always believed that these two principles were stated by me before I ever made Adler's acquaintance.

This striving of Adler's for a place in the sun has, however, had one result which is bound to be beneficial to psychoanalysis. When, after irreconcilable scientific disagreements had come to light, I was obliged to bring about Adler's resignation from the editorship of the *Zentralblatt*, he left the Vienna society as well, and founded a new one, which at first adopted the tasteful name of 'The Society for Free Psychoanalysis' ['*Verein für freie Psychoanalyse*']. But outsiders who are unconnected with analysis are evidently as unskilful in appreciating the differences between the views of two psychoanalysts as we Europeans are in detecting the differences between two Chinese faces. 'Free' psychoanalysis remained in the shadow of 'official', 'orthodox' psychoanalysis and was treated merely as an appendage to the latter. Then Adler took a step for [52]
which we are thankful; he severed all connection with psychoanalysis, and gave his theory the name of 'Individual Psychology'. There is room enough on God's earth, and anyone who can has a perfect right to potter about on it without being prevented; but it is not a desirable thing for people who have ceased to understand one another and have grown incompatible with one another to remain under the same roof. Adler's 'Individual Psychology' is now one of the many schools of psychology

1 [The terms 'as if' and 'jargon' figure prominently in Adler's writings.]

which are adverse to psychoanalysis and its further development is no concern of ours.

The Adlerian theory was from the very beginning a 'system' – which psychoanalysis was careful to avoid becoming. It is also a remarkably good example of 'secondary revision', such as occurs, for instance, in the process to which dream material is submitted by the action of waking thought. In Adler's case the place of dream material is taken by the new material obtained through psychoanalytic studies; this is then viewed purely from the standpoint of the ego [*Ichs*][T], reduced to the categories with which the ego is familiar, translated, twisted and – exactly as happens in dream formation – is misunderstood.[1] Moreover, the Adlerian theory is characterized less by what it asserts than by what it denies, so that it consists of three sorts of elements of quite dissimilar value: useful contributions to the psychology of the ego, superfluous but admissible translations of the analytic facts into the new 'jargon', and distortions and perversions of these facts when they do not comply with the requirements of the ego.

The elements of the first sort have never been ignored by psychoanalysis, although they did not deserve any special attention from it; it was more concerned to show that every ego trend contains libidinal components. The Adlerian theory emphasizes the counterpart to this, the egoistic [*egoistischen*] constituent in libidinal drive impulses. This would have been an appreciable gain if Adler had not on every occasion used this observation in order to deny the libidinal impulses in favour of their egoistic drive components [*Ichtriebkomponente*]. His theory does what every patient does and what our conscious thought in general does – namely, makes use of a *rationalization*, as Jones [1908] has called it, in order to conceal the unconscious motive. Adler is so consistent in this [53] that he positively considers that the strongest driving impetus [*Triebfeder*] in the sexual act is the man's intention of showing himself master of the woman – of being 'on top'. I do not know if he has expressed these monstrous notions in his writings.

Psychoanalysis recognized early that every neurotic symptom owes its possibility of existence to a compromise. Every symptom must therefore in some way comply with the demands of the ego which manipulates the repression; it must offer some advantage, it must admit of some useful application, or it would meet with the same fate as the original drive impulse itself which has been fended off. The term 'gain from illness' has taken this into account; one is even justified in differentiating the

1 [See Chapter VI (I) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 438 f.]

'primary' gain to the ego, which must be operative at the time of the generation of the symptom, from a 'secondary' part, which supervenes in attachment [*Anlehnung*][T] to other purposes of the ego, if the symptom is to persist.[1] It has also long been known that the withdrawal of this gain from illness, or its disappearance in consequence of some change in real external circumstances, constitutes one of the mechanisms of a cure of the symptom. In the Adlerian doctrine the main emphasis falls on these easily verifiable and clearly intelligible connections, while the fact is altogether overlooked that on countless occasions the ego is merely making a virtue of necessity in submitting, because of its usefulness, to the very disagreeable symptom which is forced upon it – for instance, in accepting anxiety as a means to security. The ego is here playing the ludicrous part of the clown in a circus who by his gestures tries to convince the audience that every change in the circus ring is being carried out under his orders. But only the youngest of the spectators are deceived by him.

Psychoanalysis is obliged to give its backing to the second constituent of Adler's theory as it would to something of its own. And, in fact, it is nothing else than psychoanalytic knowledge, which that author extracted from sources open to everyone during ten years of work in common and which he has now labelled as his own by a change in nomenclature. I myself consider 'safeguarding [*Sicherung*]', for instance, a better term than 'protective measure [*Schutzmassregel*]' which is the one I employ; but I cannot discover any difference in their meaning. Again, a host of familiar features come to light in Adler's [54]
propositions when one restores the earlier 'phantasied [*phantasiert*]' and 'phantasy [*Phantasie*]' in place of 'feigned [*fingiert*]', 'fictive [*fiktiv*]' and 'fiction [*Fiktion*]'. The identity of these terms would be insisted upon by psychoanalysis even if their author had not taken part in our common work over a period of many years.

The third part of the Adlerian theory, the twisted interpretations and distortions of the disagreeable facts of analysis, are what definitely separate 'Individual Psychology', as it is now to be called, from psychoanalysis. As we know, the principle of Adler's system is that the individual's aim of self-assertion, his 'will to power', is what, in the form of a 'masculine protest',[2] plays a dominating part in the conduct of life,

1 [A full discussion of the primary and secondary gain from illness can be found in Lecture XXIV of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 337–9. It is mentioned again in a footnote added in 1923 to the 'Dora' case history (1905*e*), ibid., 7, 39 *n*., where Freud revised his earlier views, and gave what is probably the clearest account of the topic.]

2 [The term 'masculine protest' was introduced by Adler in a paper at the Nuremberg International Psychoanalytical Congress in 1910. (See Adler, 1910.)]

in character formation and in neurosis. This 'masculine protest', the Adlerian motive force [*Motor*], is nothing else, however, but repression detached from its psychological mechanism and, moreover, sexualized in addition – which ill accords with the vaunted ejection of sexuality from its place in mental life.[1] The 'masculine protest' undoubtedly exists, but if it is made into the [sole] driving force of mental life the observed facts are being treated like a springboard that is left behind after it has been used to jump off from. Let us consider one of the fundamental situations in which desire [*Begehrens*] is felt in infancy: that of a child observing the sexual act between adults. Analysis shows, in the case of people with whose life story the physician will later be concerned, that at such moments two impulses [*Regungen*] take possession of the immature spectator. In boys, one is the impulse to put himself in the place of the active man, and the other, the opposing current, is the impulse to identify himself with the passive woman.[2] Between them these two impulses exhaust the pleasurable possibilities [*Lustmöglichkeiten*][T] of the situation. The first alone can come under the head of the masculine protest, if that concept is to retain any meaning at all. The second, however, the further course of which Adler disregards or which he knows nothing about, is the one that will become the more important in the subsequent neurosis. Adler has so merged himself in the jealous narrowness of the ego that he takes account only of those drive impulses which are agreeable to the ego and are encouraged by it; the situation in neurosis, in which the impulses are *opposed* to the ego, is precisely the one that lies beyond his horizon.

Lust [55]

In connection with the attempt, which psychoanalysis has made necessary, to correlate the fundamental principle of its theory with the mental life of children, Adler exhibits the most serious departures from actual observation and the most fundamental confusion in his concepts. The biological, social and psychological meanings of 'masculine' and 'feminine' are here hopelessly mixed.[3] It is impossible, and is disproved by observation, that a child, whether male or female, should found the plan of its life on an original depreciation of the female sex and take the wish to be a real man as its 'guiding line'.[4] Children have, to begin with, no

1 [Freud discussed Adler's explanation of repression at greater length in his paper 'A Child is Being Beaten' (1919*e*), *RSE*, **17**, 195 f. – Some discussion of the 'masculine protest' in relation to narcissism can be found below (p. 80) and in Freud (1923*d*), *RSE*, **19**, 82.]

2 [Cf. Chapter III of *The Ego and the Id* (1923*b*), ibid., **19**, 27 f.]

3 [Cf. a footnote added in 1915 to Section 4 of the third of Freud's *Three Essays* (1905*d*), ibid., **7**, 194 *n.* 1.]

4 ['*Leitlinie*', a term constantly used by Adler.]

idea of the significance of the distinction between the sexes; on the contrary, they start with the assumption that the same genital organ (the male one) is possessed by both sexes; they do not begin their sexual researches [*Sexualforschung*] with the problem of the distinction between the sexes [*des Geschlechtsdifferenz*],[1] while the *social* underestimation of women is completely foreign to them. There are women in whose neurosis the wish to be a man has played no part. Whatever in the nature of a masculine protest can be shown to exist is easily traceable to a disturbance in primary narcissism due to threats of castration or to the earliest interferences with sexual activities. All disputes about the psychogenesis of the neuroses must eventually be decided in the field of the neuroses of childhood. Careful dissection of a neurosis in early childhood puts an end to all misapprehensions about the aetiology of the neuroses and to [56] all doubts about the part played by the sexual drives in them.[2] That is why, in his criticism of Jung's paper 'Conflicts in the Mind of the Child' [1910*c*], Adler [1911*a*] was obliged to resort to the imputation that the facts of the case had been one-sidedly arranged, 'no doubt by the [child's] father'.

I will not dwell any longer on the biological aspect of the Adlerian theory nor discuss whether either actual 'organ inferiority' [p. 44 *n.* above] or the subjective feeling of it – one does not know which – is really capable of serving as the foundation of Adler's system. I will merely remark in passing that if it were so neurosis would appear as a by-product of every kind of physical decrepitude, whereas observation shows that an impressive majority of ugly, misshapen, crippled and miserable people fail to react to their defects by neurosis. Nor will I deal with the interesting assertion according to which inferiority is to be traced back to the feeling of being a child. It shows the disguise under which the factor of infantilism, which is so strongly emphasized by psychoanalysis, reappears in 'Individual Psychology'. On the other hand, I must point out how all the psychological acquisitions of psychoanalysis have been thrown to the winds by Adler. In his book *Über den nervösen Charakter* [1912] the unconscious is still mentioned as a psychological peculiarity, without, however, any relation to his system. Later, he has consistently declared that it is a matter of indifference to him whether an idea is conscious or unconscious. Adler has never from the first shown any understanding of

1 [This statement (which was repeated in a passage added in 1915 to Section 5 of the second of Freud's *Three Essays*, *RSE*, **7**, 172) was corrected in his later paper on the distinction between the sexes (1925*j*), ibid., **19**, 249 ff.]

2 [The illustration of this fact is the main thesis of Freud's 'Wolf Man' analysis (1918*b*), which was drafted a few months after the present paper. See ibid., **17**, 98 f.]

repression. In an abstract of a paper read by him at the Vienna Society (February, 1911) he wrote that it must be pointed out that the evidence in a particular case showed that the patient had never repressed his libido, but had been continually 'safeguarding' himself against it.[1] Soon afterwards, in a discussion at the Vienna Society, he said: 'If you ask where repression comes from, you are told, "from civilization"; but if you go on to ask where civilization comes from, you are told "from repression". So you see it is all simply playing with words.' A tithe of the acuteness and
[57] ingenuity with which Adler has unmasked the defensive devices of the 'nervous character' would have been enough to show him the way out of this pettifogging argument. What is meant is simply that civilization is based on the repressions effected by former generations, and that each fresh generation is required to maintain this civilization by effecting the same repressions. I once heard of a child who thought people were laughing at him, and began to cry, because when he asked where eggs come from he was told 'from hens', and when he went on to ask where hens come from he was told 'from eggs'. But they were not playing with words; on the contrary, they were telling him the truth.

Everything that Adler has to say about dreams, the shibboleth of psychoanalysis, is equally pitiful and empty. At first he regarded dreams as a turning away from the feminine to the masculine line – which is simply a translation of the wish-fulfilment theory of dreams into the language of the 'masculine protest'. Later he found that the essence of dreams lies in enabling men to accomplish unconsciously what they are denied consciously. Adler [1911*b*, 215 *n*.] must also be credited with priority in confusing dreams with latent dream thoughts – a confusion on which the discovery of his 'prospective purpose' rests. Maeder [1912] followed his lead in this later.[2] Here the fact is readily overlooked that every interpretation of a dream which is incomprehensible in its manifest form is based on the very method of dream interpretation whose premises and conclusions are being disputed. In regard to resistance Adler informs us that it serves the purpose of putting into effect the patient's opposition to the physician. This is certainly true; it is as much as to say that it serves the purpose of resistance. Where it comes from, however, or how it happens that its phenomena are at the disposal of the patient is not further enquired into, as being of no interest to the ego. The detailed mechanism of the symptoms and manifestations of diseases, the explanation of the manifold variety of those diseases and their forms of expression, are disregarded *in toto*; for everything alike is pressed into the service of the

1 [This abstract can be found in *Zbl. Psychoan.*, **1**, 371.]

2 [See a footnote added in 1914 to *The Interpretation of Dreams*, *RSE*, **5**, 518–19 *n*.]

masculine protest, self-assertion and the aggrandizement of the personality. The system is complete; to produce it has cost an enormous amount of labour in the recasting of interpretations, while it has not furnished a single new observation. I fancy I have made it clear that it has nothing to [58]
do with psychoanalysis.

The view of life which is reflected in the Adlerian system is founded exclusively on the aggressive drive; there is no room in it for love. We might feel surprise that such a cheerless *Weltanschauung* should have met with any attention at all; but we must not forget that human beings, weighed down by the burden of their sexual needs, are ready to accept anything if only the 'overcoming of sexuality' is offered them as a bait.

Adler's secession took place before the Weimar Congress in 1911; after that date the Swiss began theirs. The first signs of it, curiously enough, were a few remarks of Riklin's in some popular articles appearing in Swiss publications, so that the general public learnt earlier than those most intimately concerned in the subject that psychoanalysis had got the better of some regrettable errors which had previously discredited it. In 1912 Jung boasted, in a letter from America, that his modifications of psychoanalysis had overcome the resistances of many people who had hitherto refused to have anything to do with it. I replied that that was nothing to boast of, and that the more he sacrificed of the hard-won truths of psychoanalysis the more would he see resistances vanishing. This modification which the Swiss were so proud of introducing was again nothing else but a pushing into the background of the sexual factor in psychoanalytic theory. I confess that from the beginning I regarded this 'advance' as too far-reaching an adjustment to the demands of actuality.

These two retrograde movements away from psychoanalysis, which I must now compare with each other, show another point in common: for they both court a favourable opinion by putting forward certain lofty ideas, which view things, as it were, *sub specie aeternitatis*. With Adler, this part is played by the relativity of all knowledge and the right of the personality to put an artificial construction on the data of knowledge according to individual taste; with Jung, the appeal is made to the historic right of youth to throw off the fetters in which tyrannical age with its hidebound views seeks to bind it. A few words must be devoted to exposing the fallacy of these ideas.

The relativity of our knowledge is a consideration which may be [59]
advanced against every other science just as well as against

psychoanalysis. It is derived from familiar reactionary currents of present-day feeling which are hostile to science, and it lays claim to an appearance of superiority to which no-one is entitled. None of us can guess what the ultimate judgement of mankind about our theoretical efforts will be. There are instances in which rejection by the first three generations has been corrected by the succeeding one and changed into recognition. After a man has listened carefully to the voice of criticism in himself and has paid some attention to the criticisms of his opponents, there is nothing for him to do but with all his strength to maintain his own convictions which are based on experience. One should be content to conduct one's case honestly, and should not assume the office of judge, which is reserved for the remote future. The stress on arbitrary personal views in scientific matters is bad; it is clearly an attempt to dispute the right of psychoanalysis to be valued as a science – after that value, incidentally, has already been depreciated by what has been said before [on the relative nature of all knowledge]. Anyone who sets a high value on scientific thought will rather seek every possible means and method of circumscribing the factor of fanciful personal predilections as far as possible wherever it still plays too great a part. Moreover, it is opportune to recall that any zeal in defending ourselves is out of place. These arguments of Adler's are not intended seriously. They are only meant for use against his opponents; they do not touch his own theories. Nor have they prevented his followers from hailing him as the Messiah, for whose appearance expectant humanity has been prepared by a number of forerunners. The Messiah is certainly no relative phenomenon.

Jung's argument *ad captandam benevolentiam*[1] rests on the too optimistic assumption that the progress of the human race, of civilization and knowledge, has always pursued an unbroken line; as if there had been no periods of decadence, no reactions and restorations after every revolution, no generations who have taken a backward step and abandoned the gains of their predecessors. His approach to the standpoint of the masses, his abandonment of an innovation which proved unwelcome, make it *a priori* improbable that Jung's corrected version of psychoanalysis can justly claim to be a youthful act
[60] of liberation. After all, it is not the age of the doer that decides this but the character of the deed.

Of the two movements under discussion Adler's is indubitably the more important; while radically false, it is marked by consistency and

1 ['For the purpose of gaining goodwill.']

coherence. It is, moreover, in spite of everything, founded upon a theory of the drives. Jung's modification, on the other hand, loosens the connection of the phenomena with drive activity; and further, as its critics (e.g. Abraham, Ferenczi and Jones) have pointed out, it is so obscure, unintelligible and confused as to make it difficult to take up any position upon it. Wherever one lays hold of anything, one must be prepared to hear that one has misunderstood it, and one cannot see how to arrive at a correct understanding of it. It is put forward in a peculiarly vacillating manner, one moment as 'quite a mild deviation, which does not justify the outcry that has been raised about it' (Jung), and the next moment as a new message of salvation which is to begin a new epoch for psychoanalysis, and, indeed, a new *Weltanschauung* for everyone.

When one thinks of the inconsistencies displayed in the various public and private pronouncements made by the Jungian movement, one is bound to ask oneself how much of this is due to lack of clearness and how much to lack of sincerity. It must be admitted, however, that the exponents of the new theory find themselves in a difficult position. They are now disputing things which they themselves formerly upheld, and they are doing so, moreover, not on the ground of fresh observations which might have taught them something further, but in consequence of fresh interpretations which make the things they see look different to them now from what they did before. For this reason they are unwilling to give up their connection with psychoanalysis, as whose representatives they became known to the world, and prefer to give it out that psychoanalysis has changed. At the Munich Congress I found it necessary to clear up this confusion, and I did so by declaring that I did not recognize the innovations of the Swiss as legitimate continuations and further developments of the psychoanalysis that originated with me. Outside critics (like Furtmüller) had already seen how things were, and Abraham is right in saying that Jung is in full retreat from psychoanalysis. I am of course perfectly ready to allow that everyone has a right to think and to write what he pleases; but he has no right to put it forward as [61] something other than what it really is.

Just as Adler's investigation brought something new to psychoanalysis – a contribution to the psychology of the ego – and then expected us to pay too high a price for this gift by throwing over all the fundamental theories of analysis, so in the same way Jung and his followers paved the way for their fight against psychoanalysis by presenting it with a new

acquisition. They traced in detail (as Pfister did before them) the way in which the material of sexual ideas belonging to the family complex and incestuous object choice is made use of in representing the highest ethical and religious interests of man – that is, they have illuminated an important instance of the sublimation of the erotic drive forces and of their transformation into trends which can no longer be called erotic. This was in complete harmony with all the expectations of psychoanalysis, and would have agreed very well with the view that in dreams and neurosis a regressive dissolution of this sublimation, as of all others, becomes visible. But the world would have risen in indignation and protested that ethics and religion were being sexualized. Now I cannot refrain from thinking teleologically for once and concluding that these discoverers were not equal to meeting such a storm of indignation. Perhaps it even began to rage in their own bosoms. The theological prehistory of so many of the Swiss throws no less light on their attitude to psychoanalysis than does Adler's socialist prehistory on the development of his psychology. One is reminded of Mark Twain's famous story of all the things that happened to his watch and of his concluding words: 'And he used to wonder what became of all the unsuccessful tinkers, and gunsmiths, and shoemakers, and blacksmiths; but nobody could ever tell him.'

Suppose – to make use of a simile – that in a particular social group there lives a *parvenu*, who boasts of being descended from a noble family living in another place. It is pointed out to him, however, that his parents live somewhere in the neighbourhood, and that they are quite humble people. There is only one way of escape from his difficulty and he seizes on it. He can no longer repudiate his parents, but he asserts that they themselves are of noble lineage and have merely come down in the world; and he procures a family tree from some obliging official source.
[62] It seems to me that the Swiss have been obliged to behave in much the same way. If ethics and religion were not allowed to be sexualized but had to be something 'higher' from the start, and if nevertheless the ideas contained in them seemed undeniably to be descended from the Oedipus and family complex, there could be only one way out: it must be that from the very first these complexes themselves do not mean what they seem to be expressing, but bear the higher 'anagogic' meaning (as Silberer [1914] calls it) which made it possible for them to be employed in the abstract trains of thought of ethics and religious mysticism.

I am quite prepared to be told again that I have misunderstood the substance and purpose of the Neo-Zürich theory; but I must protest in

advance against any contradictions to my view of it that may be found in the publications of that school being laid at my door instead of theirs. I can find no other way of making the whole range of Jung's innovations intelligible to myself and of grasping all their implications. All the changes that Jung has proposed to make in psychoanalysis flow from his intention to eliminate what is objectionable in the family complexes, so as not to find it again in religion and ethics. For sexual libido an abstract concept has been substituted, of which one may safely say that it remains mystifying and incomprehensible to wise men and fools alike. The Oedipus complex has a merely 'symbolic' meaning: the mother in it means the unattainable, which must be renounced in the interests of civilization; the father who is killed in the Oedipus myth is the 'inner' father, from whom one must set oneself free in order to become independent. Other parts of the material of sexual ideas will no doubt be subjected to similar reinterpretations in the course of time. In the place of a conflict between ego-dystonic erotic trends and the self-preservative ones a conflict appears between the 'life-task' and 'psychical inertia' [see p. 269 below]; the neurotic's sense of guilt corresponds to his self-reproach for not properly fulfilling his 'life-task'. In this way a new religio-ethical system has been created, which, just like the Adlerian system, was bound to reinterpret, distort or jettison the factual findings of analysis. The truth is that these people have picked out a few cultural overtones from the symphony of life and have once more failed to hear the mighty and primordial melody of the drives.

In order to preserve this system intact it was necessary to turn entirely away from observation and from the technique of psychoanalysis. Occasionally, enthusiasm for the cause even permitted a disregard [63] of scientific logic – as when Jung finds that the Oedipus complex is not 'specific' enough for the aetiology of the neuroses, and proceeds to attribute this specific quality to inertia, the most universal characteristic of all matter, animate and inanimate! It is to be noted, by the way, that the 'Oedipus complex' represents only a topic with which the individual's mental forces have to deal, and is not itself a force, like 'psychical inertia'. The study of individual people had shown (and always will show) that the sexual complexes in their original sense are alive in them. On that account the investigation of individuals was pushed into the background [in the new theories] and replaced by conclusions based on evidence derived from anthropological research. The greatest risk of coming up against the original, undisguised meaning of these reinterpreted complexes was to be met with in the early childhood of

every individual; consequently in therapy the injunction was laid down that this past history should be dwelt on as little as possible and the main emphasis put on reverting to the current conflict, in which, moreover, the essential thing was on no account to be what was accidental and personal, but what was general – in fact, the non-fulfilment of the life-task. As we know, however, a neurotic's current conflict becomes comprehensible and admits of solution only when it is traced back to his prehistory, when one goes back along the path that his libido took when he fell ill.

The form taken by the Neo-Zürich therapy under these influences can be conveyed in the words of a patient who experienced it himself: 'This time not a trace of attention was given to the past or to the transference. Wherever I thought I recognized the latter it was pronounced to be a pure libidinal symbol. The moral instruction was very fine and I followed it faithfully, but I did not advance a step. It was even more annoying for me than for him, but how could I help it? . . . Instead of freeing me by analysis, every day brought fresh tremendous demands on me, which had to be fulfilled if the neurosis was to be conquered – for instance, inward concentration by means of introversion, religious meditation, resuming life with my wife in loving devotion, etc. It was almost beyond one's strength; it was aiming at a radical transformation of one's whole
[64] inner nature. I left the analysis as a poor sinner with intense feelings of contrition and the best resolutions, but at the same time in utter discouragement. Any clergyman would have advised what he recommended, but where was I to find the strength?' The patient, it is true, reported that he had heard that analysis of the past and of the transference must be gone through first; but he had been told that he had already had enough of it. Since this first kind of analysis had not helped him more, the conclusion seems to me justified that the patient had *not* had enough of it. Certainly the subsequent treatment, which no longer had any claim to be called psychoanalysis, did not improve matters. It is remarkable that the members of the Zürich school should have made the long journey round by way of Vienna in order to wind up at the nearby city of Bern, where Dubois[1] cures neuroses by ethical encouragement in a more considerate manner.[2]

The total incompatibility of this new movement with psychoanalysis

1 [Paul Dubois (1848–1918), Professor of Neuropathology at Bern, had some celebrity during the early part of the century for his method of treating neuroses by 'persuasion'.]

2 I know the objections there are to making use of a patient's reports, and I will therefore expressly state that my informant is a trustworthy person, very well capable of forming a judgement. He gave me this information quite spontaneously and I make use of his communication without asking his consent, since I cannot allow that a psychoanalytic technique has any right to claim the protection of medical discretion.

shows itself too, of course, in Jung's treatment of repression, which is hardly mentioned nowadays in his writings, in his misunderstanding of dreams, which, like Adler [cf. p. 50 above], in complete disregard of dream psychology, he confuses with the latent dream thoughts, and in his loss of all understanding of the unconscious – in short, in all the points which I should regard as the essence of psychoanalysis. When Jung tells us that the incest complex is merely 'symbolic', that after all it has no 'real' existence, that after all a savage feels no desire towards an old hag but prefers a young and pretty woman, we are tempted to conclude that 'symbolic' and 'without real existence' simply mean something which, by virtue of its manifestations and pathogenic effects, is described by psychoanalysis as 'existing unconsciously' – a description that disposes of the apparent contradiction.

If one bears in mind that dreams are something different from the latent dream thoughts which they work over, there is nothing surprising [65] in patients dreaming of things with which their minds have been filled during the treatment, whether it be the 'life-task', or 'being on top' or 'underneath'. The dreams of people being analysed can undoubtedly be directed, in the same way as they are by stimuli produced for experimental purposes. One can determine a part of the material which appears in a dream; nothing in the essence or mechanism of dreams is altered by this. Nor do I believe that 'biographical' dreams, as they are called, occur outside analysis.[1] If, on the other hand, one analyses dreams which occurred before treatment, or if one considers the dreamer's own additions to what has been suggested to him in the treatment, or if one avoids setting him any such tasks, then one may convince oneself how far removed it is from the purpose of a dream to produce attempted solutions to the life-task. Dreams are only a form of thinking; one can never reach an understanding of this form by reference to the content of the thoughts; only an appreciation of the dream-work will lead to that understanding.[2]

It is not difficult to find a factual refutation of Jung's misconceptions of psychoanalysis and deviations from it. Every analysis conducted in a proper manner, and in particular every analysis of a child, strengthens the convictions upon which the theory of psychoanalysis is founded, and rebuts the reinterpretations made by both Jung's and Adler's systems. In the days before his illumination, Jung himself [1910*b*; see above, p. 26] carried out and published an analysis of this kind of a child; it remains to

1 [See *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 312.]

2 [The topic of this paragraph was discussed by Freud at greater length in Section VII of 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), ibid., **19**. Cf. also a footnote added in 1925 to Chapter VI (I) of *The Interpretation of Dreams*, ibid., **5**, 453 *n.* 2.]

be seen whether he will undertake a new interpretation of its results with the help of a different 'one-sided arrangement of the facts', to use the expression employed by Adler in this connection [p. 49 above].

The view that the sexual representation of 'higher' thoughts in dreams and neurosis is nothing but an archaic mode of expression is of course irreconcilable with the fact that in neurosis these sexual complexes prove to be the bearers of the quantities of libido which have been withdrawn from utilization in real life. If it was merely a question of a
[66] sexual 'jargon', the economy of the libido could not have been altered in any way by it. Jung admits this himself in his *Darstellung der psychoanalytischen Theorie* [1913] and formulates the task of therapy as the detaching of libidinal cathexes from these complexes. This can never be achieved, however, by directing the patient away from them and urging him to sublimate, but only by exhaustive examination of them and by making them fully and completely conscious. The first piece of reality which the patient must deal with is his illness. Efforts to spare him that task point to the physician's incapacity to help him to overcome his resistances, or else to the physician's dread of the results of the work.

It may be said lastly that by his 'modification' of psychoanalysis Jung has given us a counterpart to the famous Lichtenberg knife.[1] He has changed the hilt, and he has put a new blade into it; yet because the same name is engraved on it we are expected to regard the instrument as the original one.

I think I have made clear, on the contrary, that the new teaching which aims at replacing psychoanalysis signifies an abandonment of analysis and a secession from it. Some people may be inclined to fear that this secession is bound to have more momentous consequences for analysis than would another, owing to its having been started by men who have played so great a part in the movement and have done so much to advance it. I do not share this apprehension.

Men are strong so long as they represent a strong idea; they become powerless when they oppose it. Psychoanalysis will survive this loss and gain new adherents in place of these. In conclusion, I can only express a wish that fortune may grant an agreeable upward journey to all those who have found their stay in the underworld of psychoanalysis too uncomfortable for their taste. The rest of us, I hope, will be permitted without hindrance to carry through to their conclusion our labours in the depths.

February, 1914

The present translation is a revised and corrected reprint of the *SE* version.

The title of this paper would have been more literally translated 'On the Introduction of the Concept of Narcissism'. Freud had been using the term for many years previously. We learn from Ernest Jones (1955, 304) that at a meeting of the Vienna Psychoanalytical Society on November 10, 1909, Freud had declared that narcissism was a necessary intermediate stage between auto-erotism and object love. At about the same time he was preparing the second edition of the *Three Essays on the Theory of Sexuality* (1905*d*) for the press (the Preface is dated 'December, 1909'), and it seems probable that the first public mention of the new term is to be found in a footnote added to that edition (*RSE*, **7**, 129 *n*.) – assuming, that is to say, that the new edition appeared in the early part of 1910. For at the end of May in the same year Freud's book on Leonardo (1910*c*) appeared, in which there is a considerably longer reference to narcissism (ibid., **11**, 91 f.). A paper on the subject by Rank, mentioned by

Freud at the beginning of the present study, was published in 1911, and other refer-
[70] ences by Freud himself soon followed, e.g. in Section III of the Schreber analysis (1911*c*), *RSE*, **12**, and in *Totem and Taboo* (1912–13*a*), ibid., **13**, 86–8.

The idea of writing the present paper emerges in Freud's letters for the first time in June, 1913, and he finished a first draft of it during a holiday in Rome in the third week of September of the same year. It was not until the end of February, 1914, that he started on the final version and it was completed a month later.

The paper is among the most important of Freud's writings and may be regarded as one of the pivots in the evolution of his views. It sums up his earlier discussions on the subject of narcissism and considers the place taken by narcissism in sexual development; but it goes far beyond this. For it enters into the deeper problems of the relations between the ego and external objects, and it draws the new distinction between 'ego libido' and 'object libido'. Furthermore – most important of all, perhaps – it introduces the concepts of the 'ego ideal' and of the self-observing agency related to it, which were the basis of what was ultimately to be described as the 'superego' in *The Ego and the Id* (1923*b*), ibid., **19**. And in addition to all this, at two points in the paper – at the end of the first section and at the beginning of the third – it trenches upon the controversies with Adler and Jung which were the principal theme of the 'History of the Psychoanalytic Movement', written more or less simultaneously with the present work during the early months of 1914. Indeed, one of Freud's motives in writing this paper was, no doubt, to show that the concept of narcissism offers an alternative to Jung's nonsexual 'libido' and to Adler's 'masculine protest'.

These are far from being the only topics raised in the paper, and it is therefore scarcely surprising that it should have an unusual appearance of being overcompressed – of its framework bursting from the quantity of material it contains. Freud himself seems to have felt something of the kind. Ernest Jones tells us (1955, 340) that 'he was very dissatisfied with the result' and wrote to Abraham: 'The "Narcissism" had a difficult labour and bears all the marks of a corresponding deformation.'

However this may be, the paper is one which demands and repays prolonged study; and it was the starting point of many later lines of thought. Some of these, for instance, were pursued further in 'Mourning and Melancholia' (1916–17*g* [1915]),
[71] p. 217 ff. below, and in Chapters VIII and XI of *Group Psychology* (1921*c*), *RSE*, **18**. The subject of narcissism, it may be added, occupies the greater part of Lecture XXVI of the *Introductory Lectures* (1916–17*a*), ibid., **16**. The further development of the fresh views on the structure of the mind which are already beginning to become apparent in the present paper led Freud later to a reassessment of some of the statements he makes here, especially as regards the functioning of the ego. In this connection it must be pointed out that the meaning which Freud attached to '*das Ich*' (almost invariably translated by 'the ego' in this edition) underwent a gradual modification. At first he used the term without any great precision, as we might speak of 'the self'; but in his latest writings he gave it a very much more definite and narrow meaning. The present paper occupies a transitional point in this development. The whole topic can be found discussed more fully in the Editors' Introduction to *The Ego and the Id* (1923*b*), and in the notes on the translation in Volume 24.

ON NARCISSISM: AN INTRODUCTION[t]

I

The term narcissism is derived from clinical description and was chosen by Paul Näcke[1] in 1899 to denote the attitude of a person who treats his own body in the same way in which the body of a sexual object [*Sexualobjekts*][T] is ordinarily treated – who looks at it, that is to say, strokes it and fondles it with sexual pleasure[2] till he obtains complete satisfaction through these activities. Developed to this degree, narcissism has the significance of a perversion that has absorbed the whole of the subject's [*der Person*][T] sexual life, and it will consequently exhibit the characteristics which we expect to meet with in the study of all perversions. [73] *Sex*

Psychoanalytic observers were subsequently struck by the fact that individual features of the narcissistic attitude are found in many people who suffer from other disorders – for instance, as Sadger has pointed out, in homosexuals – and finally it seemed probable that an allocation of the libido such as deserved to be described as narcissism might be present far more extensively, and that it might claim a place in the regular course of human sexual development.[3] Difficulties in psychoanalytic work upon neurotics led to the same supposition, for it seemed as though this kind of narcissistic attitude in them constituted one of the limits to their susceptibility to influence. Narcissism in this sense would

1 [In a footnote added by Freud in 1920 to his *Three Essays* (1905*d*), *RSE*, **7**, 193 *n*. 2, he said that he was wrong in stating in the present paper that the term 'narcissism' was introduced by Näcke and that he should have attributed it to Havelock Ellis. Ellis himself, however, subsequently (1927) wrote a short paper in which he corrected Freud's correction and argued that the priority should in fact be divided between himself and Näcke, explaining that the term 'narcissus-like' had been used by him in 1898 as a description of a psychological attitude, and that Näcke in 1899 had introduced the term '*Narcismus*' to describe a sexual perversion. The German word used by Freud is '*Narzissmus*'. In his paper on Schreber (1911*c*), in Section III, he defends this form of the word on the ground of euphony against the possibly more correct '*Narzissismus*'. (See ibid., **12**, 52 *n*. 3.)]

2 [The last three words were omitted in the *SE* translation.]

3 Otto Rank (1911*f*).

[74] not be a perversion, but the libidinal complement to the egoism [*Egoismus*] of the drive to self-preservation [*Selbsterhaltungstriebes*][T], a measure of which may justifiably be attributed to every living creature.

A pressing motive for occupying ourselves with the conception [*Vorstellung*][T] of a primary and normal narcissism arose when the attempt was made to subsume what we know of dementia praecox (Kraepelin) or schizophrenia (Bleuler) under the hypothesis of the libido theory. Patients of this kind, whom I have proposed to term paraphrenics,[1] display two fundamental characteristics: megalomania and diversion of their interest from the external world – from people and things. In consequence of the latter change, they become inaccessible to the influence of psychoanalysis and cannot be cured by our efforts. But the paraphrenic's turning away from the external world needs to be more precisely characterized. A patient suffering from hysteria or obsessional neurosis has also, as far as his illness extends, given up his relation to reality. But analysis shows that he has by no means broken off his erotic relations to people and things. He still retains them in phantasy [*Phantasie*][T]; i.e. he has, on the one hand, substituted for real objects imaginary ones from his memory, or has mixed the latter with the former; and on the other hand, he has renounced the initiation of motor activities for the attainment of his aims in connection with those objects. Only to this condition of the libido may we legitimately apply the term 'introversion' of the libido which is used by Jung indiscriminately.[2] It is otherwise with the paraphrenic. He seems really to have withdrawn his libido from people and things in the external world, without replacing them with others in phantasy. When he *does* so replace them, the process seems to be a secondary one and to be part of an attempt at recovery, designed to lead the libido back to objects.[3]

The question arises: What happens to the libido which has been withdrawn from external objects in schizophrenia? The megalomania characteristic of these states points the way. This megalomania has no
[75] doubt come into being at the expense of object libido. The libido that has been withdrawn from the external world has been directed to the ego [*Ich*][T] and thus gives rise to an attitude which may be called narcissism. But the megalomania itself is no new creation; on the contrary, it is, as

1 [For a discussion of Freud's use of this term, see a long Editors' footnote in Section III of the Schreber analysis (1911*c*), *RSE*, **12**, 66 *n.* 1.]

2 [Cf. a footnote in 'The Dynamics of Transference' (1912*b*), ibid., **12**, 95 *n.* 3.]

3 In connection with this see my discussion of the 'end of the world' in [Section III of] the analysis of Senatspräsident Schreber [1911*c*; ibid., **12**, 59–64]; also Abraham, 1908. [See also below, p. 74 f.]

we know, a magnification and plainer manifestation of a condition which had already existed previously. This leads us to look upon the narcissism which arises through the drawing in of object cathexes [*Objektbesetzungen*][T] as a secondary one, superimposed upon a primary narcissism that is obscured by a number of different influences. *Besetzung*

Let me insist that I am not proposing here to explain or penetrate further into the problem of schizophrenia, but that I am merely putting together what has already been said elsewhere,[1] in order to justify the introduction of the concept of narcissism.

This extension of the libido theory – in my opinion, a legitimate one – receives reinforcement from a third quarter, namely, from our observations and views on the mental life [*Seelenlebens*][T] of children and primitive peoples. In the latter we find characteristics which, if they occurred singly, might be put down to megalomania: an overestimation of the power of their wishes and mental acts, the 'omnipotence of thoughts', a belief in the thaumaturgic force [*Zauberkraft*][t] of words, and a technique for dealing with the external world – 'magic' – which appears to be a logical application of these grandiose premises.[2] In the children of today, whose development is much more obscure to us, we expect to find an exactly analogous attitude towards the external world.[3] Thus we form the idea of there being an original libidinal cathexis of the ego, from which some is later given off to objects, but which fundamentally persists and is related to the object cathexes much as the body of an amoeba is related to the pseudopodia which it puts out.[4] In our researches, taking, as they did, neurotic symptoms for their [76] starting point, this part of the allocation of libido necessarily remained hidden from us at the outset. All that we noticed were the emanations of this libido – the object cathexes, which can be sent out and drawn back again. We see also, broadly speaking, an antithesis between ego libido and object libido.[5] The more of the one is employed, the more the other becomes depleted. The highest phase of development of which object libido is capable is seen in the state of being in love, when the subject *Seele*

1 [See, in particular, the works referred to in footnote 3, p. 64 above. On p. 74 f. below, Freud in fact penetrates further into the problem.]

2 Cf. the passages in my *Totem and Taboo* (1912–13*a*) which deal with this subject. [These are chiefly in the third essay, *RSE*, **13**, 81 ff.]

3 Cf. Ferenczi (1913*c*).

4 [Freud used this and similar analogies more than once again, e.g. in Lecture XXVI of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 367 f., and in his short paper on 'A Difficulty in the Path of Psychoanalysis' (1917*a*), ibid., **17**, 129. He later revised some of the views expressed here. See the end of the Editors' Note, p. 62 above.]

5 [This distinction is drawn here by Freud for the first time.]

seems to give up his own personality in favour of an object cathexis; while we have the opposite condition in the paranoic's phantasy (or self-perception) of the 'end of the world'.[1] Finally, as regards the differentiation of psychical energies, we are led to the conclusion that to begin with, during the state of narcissism, they exist together and that our analysis is too coarse to distinguish between them; not until there is object cathexis is it possible to discriminate a sexual energy – the libido – from an energy of the ego drives.[2]

Before going any further I must touch on two questions which lead us to the heart of the difficulties of our subject. In the first place, what is the relation of the narcissism of which we are now speaking to auto-erotism, which we have described as an early state of the libido?[3] Secondly, if we grant the ego a primary cathexis of libido, why is there any necessity for further distinguishing a sexual libido from a nonsexual energy of the ego drives? Would not the postulation of a single kind of psychical energy save us all the difficulties of differentiating an energy of the ego drives from ego libido, and ego libido from object libido?[4]

[77] As regards the first question, I may point out that we are bound to suppose that a unity comparable to the ego cannot exist in the individual from the start; the ego has to be developed. The auto-erotic drives, however, are there from the very first; so there must be something added to auto-erotism – a new psychical action – in order to bring about narcissism.

To be asked to give a definite answer to the second question must occasion perceptible uneasiness in every psychoanalyst. One dislikes the thought of abandoning observation for barren theoretical controversy, but nevertheless one must not shirk an attempt at clarification. It is true that notions such as that of an ego libido, an energy of the ego drives, and so on, are neither particularly easy to grasp, nor sufficiently rich in content; a speculative theory of the relations in question would begin by seeking to obtain a sharply defined concept as its basis. But I am of the opinion that that is just the difference between a speculative theory and a science erected on empirical interpretation [*Deutung*][T]. The latter will

1 [See footnote 3, p. 64 above.] There are two mechanisms of this 'end of the world' idea: in the one case, the whole libidinal cathexis flows off to the loved object; in the other, it all flows back into the ego.

2 [Some account of the development of Freud's views on the drives can be found in the Editors' Note to 'Drives and their Vicissitudes', below, p. 100 ff.]

3 [See the second of Freud's *Three Essays* (1905*d*), *RSE*, 7, 161–2.]

4 [Cf. a remark on this passage in the Editors' Note to 'Drives and their Vicissitudes', p. 102 below.]

not envy speculation its privilege of having a smooth, logically unassailable foundation, but will gladly content itself with nebulous, scarcely imaginable basic concepts, which it hopes to apprehend more clearly in the course of its development, or which it is even prepared to replace with others. For these ideas are not the foundation of science, upon which everything rests: that foundation is observation alone. They are not the bottom but the top of the whole structure [*Baues*][T], and they can be replaced and discarded without damaging it. The same thing is happening in our day in the science of physics, the basic notions of which as regards matter, centres of force, attraction, etc., are scarcely less debatable than the corresponding notions in psychoanalysis.[1]

The value of the concepts 'ego libido' and 'object libido' lies in the fact that they are derived from the study of the intimate characteristics of neurotic and psychotic processes. A differentiation of libido into a kind which is proper to the ego and one which is attached to objects is an unavoidable corollary to an original hypothesis which distinguished between sexual drives and ego drives. At any rate, analysis of the pure transference neuroses [*Übertragungsneurosen*][T] (hysteria and obsessional neurosis) compelled me to make this distinction and I only know that all attempts to account for these phenomena by other means have been completely unsuccessful. *Übertragung* [78]

In the total absence of any theory of the drives which would help us to find our bearings, we may be permitted, or rather, it is incumbent upon us, to start off by working out some hypothesis to its logical conclusion, until it either breaks down or is confirmed. There are various points in favour of the hypothesis of there having been from the first a separation between sexual drives and others, ego drives, besides the serviceability of such a hypothesis in the analysis of the transference neuroses. I admit that this latter consideration alone would not be unambiguous, for it might be a question of an indifferent psychical energy[2] which only becomes libido through the act of cathecting an object. But, in the first place, the distinction made in this concept corresponds to the common, popular distinction between hunger and love. In the second place, there are *biological* considerations in its favour. The individual does actually carry on a twofold existence: one to serve his own purposes and the other as a link in a chain, which he serves against his will, or at least

1 [This line of thought was expanded by Freud in the opening passage of his paper on 'Drives and their Vicissitudes' (1915*c*), below, p. 103.]

2 [This notion reappears in *The Ego and the Id* (1923*b*), *RSE*, **19**, 39, where the German word '*indifferente*' is, however (in the uncorrected printings of that volume), wrongly translated 'neutral'.]

involuntarily. The individual himself regards sexuality as one of his own ends; whereas from another point of view he is an appendage to his germ-plasm, at whose disposal he puts his energies in return for a bonus
Lust of pleasure [*Lustprämie*][T]. He is the mortal vehicle of a (possibly) immortal substance – like the inheritor of an entailed property, who is only the temporary holder of an estate which survives him. The separation of the sexual drives from the ego drives would simply reflect this twofold function of the individual.[1] Thirdly, we must recollect that all our provisional ideas in psychology will presumably some day be based on an organic substructure. This makes it probable that it is special substances and chemical processes which perform the operations of sexuality and provide for the extension of individual life into that of the species.[2] We are taking this probability into account in replacing the special chemical substances with special psychical forces.

[79] I try in general to keep psychology clear from everything that is different in nature from it, even biological lines of thought. For that very reason I should like at this point expressly to admit that the hypothesis of separate ego drives and sexual drives (that is to say, the libido theory) rests scarcely at all upon a psychological basis, but derives its principal support from biology. But I shall be consistent enough [with my general rule] to drop this hypothesis if psychoanalytic work should itself produce some other, more serviceable hypothesis about the drives. So far, this has not happened. It may turn out that, most basically and on the longest view, sexual energy – libido – is only the product of a differentiation in the energy at work generally in the mind. But such an assertion has no relevance. It relates to matters which are so remote from the problems of our observation, and of which we have so little cognizance, that it is as idle to dispute it as to affirm it; this primal identity may well have as little to do with our analytic interests as the primal kinship of all the races of mankind has to do with the proof of kinship required in order to establish a legal right of inheritance. All these speculations take us nowhere. Since we cannot wait for another science to present us with the final conclusions on the theory of the drives, it is far more to the purpose that we should try to see what light may be thrown upon this basic problem of biology by a synthesis of the *psychological* phenomena. Let us face the possibility of error; but do not let us be deterred from

1 [The psychological bearing of Weismann's germ-plasm theory was discussed by Freud at much greater length in Chapter VI of *Beyond the Pleasure Principle* (1920g), *RSE*, **18**, 44 ff.]

2 [See below, footnote 2, p. 110.]

pursuing the logical implications of the hypothesis we first adopted[1] of an antithesis between ego drives and sexual drives (a hypothesis to which we were forcibly led by analysis of the transference neuroses), and from seeing whether it turns out to be without contradictions and fruitful, and whether it can be applied to other disorders as well, such as schizophrenia.

It would, of course, be a different matter if it were proved that the libido theory has already come to grief in the attempt to explain the latter disease. This has been asserted by C. G. Jung (1912) and it is on that account that I have been obliged to enter upon this last discussion, which I would gladly have been spared. I should have preferred to follow to its end the course embarked upon in the analysis of the Schreber case without any discussion of its premises. But Jung's assertion is, to say the least [80]
of it, premature. The grounds he gives for it are scanty. In the first place, he appeals to an admission of my own that I myself have been obliged, owing to the difficulties of the Schreber analysis, to extend the concept of libido (that is, to give up its sexual content) and to identify libido with psychical interest in general. Ferenczi (1913*b*), in an exhaustive criticism of Jung's work, has already said all that is necessary in correction of this erroneous interpretation [*Fehldeutung*]. I can only corroborate his criticism and repeat that I have never made any such retractation of the libido theory. Another argument of Jung's, namely, that we cannot suppose that the withdrawal of the libido is in itself enough to bring about the loss of the normal function of reality,[2] is no argument but a dictum. It 'begs the question',[3] and saves discussion; for whether and how this is possible was precisely the point that should have been under investigation. In his next major work, Jung (1913, [339–40]) just misses the solution I had long since indicated: 'At the same time', he writes, 'there is this to be further taken into consideration (a point to which, incidentally, Freud refers in his work on the Schreber case [1911*c*; *RSE*, **12**]) – that the introversion of the *libido sexualis* leads to a cathexis of the "ego", and that it may possibly be this that produces the result of a loss of reality. It is indeed a tempting possibility to explain the psychology of the loss of reality in this fashion.' But Jung does not enter much further into a discussion of this possibility. A few lines[4] later he dismisses it with the remark that this

1 [*'ersterwählte'* ('first selected') in the editions before 1924. The later editions read '*ersterwähnte*' ('first mentioned'), which seems to make less good sense and may be a misprint.][t]

2 [The phrase is from Janet (1909): '*La fonction du réel*'. See the opening sentences of Freud (1911*b*), *RSE*, **12**.]

3 [In English in the original.]

4 [All the German editions before 1975 read '*Seiten*' ('pages'), a misprint for '*Zeilen*'.]

determinant 'would result in the psychology of an ascetic anchorite, not in a dementia praecox'. How little this inapt analogy can help us to decide the question may be learnt from the consideration that an anchorite of this kind, who 'tries to eradicate every trace of sexual interest' (but only in the popular sense of the word 'sexual'), does not even necessarily display any pathogenic allocation of the libido. He may have diverted his sexual interest from human beings entirely, and yet may have sublimated it into a heightened interest in the divine, in nature, or in the animal kingdom, without his libido having undergone an introversion on to his
[81] phantasies or a return to his ego. This analogy would seem to rule out in advance the possibility of differentiating between interest emanating from erotic sources and from others. Let us remember, further, that the researches of the Swiss school, however valuable, have elucidated only two features in the picture of dementia praecox – the presence in it of complexes known to us both in healthy and neurotic subjects, and the similarity of the phantasies that occur in it to popular myths – but that they have not been able to throw any further light on the mechanism of the disease. We may repudiate Jung's assertion, then, that the libido theory has come to grief in the attempt to explain dementia praecox, and that it is therefore disposed of for the other neuroses as well.

II

Certain special difficulties seem to me to lie in the way of a direct study of narcissism. Our chief means of access to it will probably remain the analysis of the paraphrenias. Just as the transference neuroses have enabled us to trace the libidinal drive impulses [*Triebregungen*][T], so dementia praecox and paranoia will give us an insight into the psychology of the ego. Once more, in order to arrive at an understanding of what seems so simple in normal phenomena, we shall have to turn to the field of pathology with its distortions and exaggerations. At the same time, other means of approach remain open to us, by which we may obtain a better knowledge of narcissism. These I shall now discuss in the following order: the study of organic disease, of hypochondria and of the erotic life of the sexes. [82] *Trieb*, *Regung*

In estimating the influence of organic disease upon the distribution of libido, I follow a suggestion made to me orally by Sándor Ferenczi. It is universally known, and we take it as a matter of course, that a person who is tormented by organic pain and discomfort gives up his interest in the things of the external world, insofar as they do not concern his suffering. Closer observation teaches us that he also withdraws *libidinal* interest from his love objects: so long as he suffers, he ceases to love. The commonplace nature of this fact is no reason why we should be deterred from translating it into terms of the libido theory. We should then say: the sick man withdraws his libidinal cathexes back upon his own ego, and sends them out again when he recovers. 'Concentrated is his soul', says Wilhelm Busch of the poet suffering from toothache, 'in his molar's narrow hole.'[1] Here libido and ego interest share the same fate and are once more indistinguishable from each other. The familiar egoism of the sick person covers both. We find it so natural because we are certain that in the same situation we should behave in just the same way. The way in which a lover's feelings, however strong, are banished by bodily ailments, and suddenly replaced by complete indifference, is a theme which has been exploited by comic writers to an appropriate extent. [83]

1 [Einzig in der engen Höhle
Des Backenzahnes weilt die Seele.
Balduin Bählamm, Chapter VIII.]

The condition of sleep, too, resembles illness in implying a narcissistic withdrawal of the positions of the libido on to the subject's own self [*Person*], or, more precisely, on to the single wish to sleep. The egoism of dreams fits very well into this context. [Cf. below, p. 207.] In both states we have, if nothing else, examples of changes in the distribution of libido that are consequent upon an alteration of the ego.

Hypochondria, like organic disease, manifests itself in distressing and painful bodily sensations, and it has the same effect as organic disease on the distribution of libido. The hypochondriac withdraws both interest and libido – the latter specially markedly – from the objects of the external world and concentrates both of them upon the organ that is engaging his attention. A difference between hypochondria and organic disease now becomes evident: in the latter, the distressing sensations are based upon demonstrable [organic] changes; in the former, this is not so. But it would be entirely in keeping with our general conception of the processes of neurosis if we decided to say that hypochondria must be right: organic changes must be supposed to be present in it, too.

But what could these changes be? We will let ourselves be guided at this point by our experience, which shows that bodily sensations of an unpleasurable nature, comparable to those of hypochondria, occur in the other neuroses as well. I have said before that I am inclined to class hypochondria with neurasthenia and anxiety neurosis as a third 'actual' neurosis[I] [*Aktualneurose*][T]. It would probably not be going too far to suppose that in the case of the other neuroses a small amount of hypochondria was regularly formed at the same time as well. We have
[84] the best example of this, I think, in anxiety neurosis with its superstructure of hysteria. Now the familiar prototype of an organ that is painfully tender, that is in some way changed and that is yet not diseased in the ordinary sense, is the genital organ in its states of excitation. In that condition it becomes congested with blood, swollen and humected [*durchfeuchtet*][t], and is the seat of a multiplicity of sensations. Let us now, taking any part of the body, describe its activity of sending sexually exciting stimuli to the mind as its 'erotogenicity', and

1 [This seems to have been first hinted at in a footnote in Section II of the Schreber case (1911*c*), *RSE*, **12**, 49 *n.* 3. It was again briefly, though more explicitly, mentioned by Freud in his closing remarks on masturbation at a discussion in the Vienna Psychoanalytical Society (1912*f*), ibid., **12**, 244–5. He returned to the subject later towards the end of Lecture XXIV of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 343 f. At a much earlier period, Freud had already approached the question of the relation between hypochondria and the other 'actual' neuroses. See Section I (2) of his first paper on anxiety neurosis (1895*b*), ibid., **3**, 83–4.]

let us further reflect that the considerations on which our theory of sexuality was based have long accustomed us to the notion that certain other parts of the body – the 'erotogenic' zones – may act as substitutes for the genitals and behave analogously to them.[1] We have then only one more step to take. We can decide to regard erotogenicity as a general characteristic of all organs and may then speak of an increase or decrease of it in a particular part of the body. For every such change in the erotogenicity of the organs there might then be a parallel change of libidinal cathexis in the ego. Such factors would constitute what we believe to underlie hypochondria and what may have the same effect upon the distribution of libido as is produced by a material illness of the organs.

We see that, if we follow up this line of thought, we come up against the problem not only of hypochondria, but of the other 'actual' neuroses – neurasthenia and anxiety neurosis. Let us therefore stop at this point. It is not within the scope of a purely psychological inquiry to penetrate so far behind the frontiers of physiological research. I will merely mention that from this point of view we may suspect that the relation of hypochondria to paraphrenia is similar to that of the other 'actual' neuroses to hysteria and obsessional neurosis: we may suspect, that is, that it is dependent on ego libido just as the others are on object libido, and that hypochondriacal anxiety is the counterpart, as coming from ego libido, to neurotic anxiety. Further, since we are already familiar with the idea that the mechanism of falling ill and of the formation of symptoms in the transference neuroses – the path from introversion to regression – is to be linked to a damming up of object libido,[2] we may come to closer quarters with the idea of a damming up of ego libido as well and may bring this idea [85] into relation with the phenomena of hypochondria and paraphrenia.

At this point, our curiosity will of course raise the question why this damming up of libido in the ego should have to be experienced as unpleasurable. I shall content myself with the answer that unpleasure [*Unlust*] is always the expression of a higher degree of tension, and that therefore what is happening is that a quantity in the field of material events is being transformed here as elsewhere into the psychical quality of unpleasure. Nevertheless, it may be that what is decisive for the generation of unpleasure is not the absolute magnitude of the material event, but rather some particular function of that absolute

1 [Cf. *Three Essays* (1905*d*), *RSE*, **7**, 162 f.]

2 Cf. [the opening pages of] 'Types of Onset of Neurosis' (1912*c*) [ibid., **12**, 227 ff.].

magnitude.[1] Here we may even venture to touch on the question of what makes it necessary at all for our mental life to pass beyond the limits of narcissism and to attach the libido to objects.[2] The answer which would follow from our line of thought would once more be that this necessity arises when the cathexis of the ego with libido exceeds a certain amount. A strong egoism is a protection against falling ill, but in the last resort we must begin to love in order not to fall ill, and we are bound to fall ill if, in consequence of frustration [*Versagung*][T], we are unable to love. This follows somewhat on the lines of Heine's picture of the psychogenesis of the Creation:

> Krankheit ist wohl der letzte Grund
> Des ganzen Schöpferdrangs gewesen;
> Erschaffend konnte ich genesen,
> Erschaffend wurde ich gesund.[3]

We have recognized our mental apparatus as being first and foremost a device designed for mastering excitations which would otherwise be felt as distressing or would have pathogenic effects. Working them over in the mind helps remarkably towards an internal draining away of excitations which are incapable of direct discharge
[86] [*Abfuhr*][T] outwards, or for which such a discharge is for the moment undesirable. In the first instance, however, it is a matter of indifference whether this internal process of working over is carried out upon real or imaginary objects. The difference does not appear till later – if the turning of the libido on to unreal objects (introversion) has led to its being dammed up. In paraphrenics, megalomania allows of a similar internal working over of libido which has returned to the ego; perhaps it is only when the megalomania fails that the damming up of libido in the ego becomes pathogenic and starts the process of recovery which gives us the impression of being a disease.

I shall try here to penetrate a little further into the mechanism of paraphrenia and shall bring together those views which already seem to me to deserve consideration. The difference between paraphrenic

1 [This whole question is discussed much more fully in 'Drives and their Vicissitudes' (1915*c*), below, p. 104 ff. For the use of the term 'quantity' in the last sentence, see Part I, Section 1, of Freud's 'Project' (1950*a*), *RSE*, **1**, written in 1895.]

2 [A much more elaborate discussion of this problem too can be found in 'Drives and their Vicissitudes' (1915*c*), p. 118 ff. below.]

3 [God is imagined as saying: 'Illness was no doubt the final cause of the whole urge to create. By creating, I could recover; by creating, I became healthy.' *Neue Gedichte*, 'Schöpfungslieder VII'.]

affections and the transference neuroses appears to me to lie in the circumstance that, in the former, the libido that is liberated by frustration does not remain attached to objects in phantasy, but withdraws on to the ego. Megalomania would accordingly correspond to the psychical mastering of this latter amount of libido, and would thus be the counterpart of the introversion on to phantasies that is found in the transference neuroses; a failure [*Versagen*] of this psychical function gives rise to the hypochondria of paraphrenia and this is homologous to the anxiety of the transference neuroses. We know that this anxiety can be resolved by further psychical working over, i.e. by conversion, reaction-formation or the construction of protections (phobias). The corresponding process in paraphrenics is an attempt at restoration, to which the striking manifestations of the disease are due. Since paraphrenia frequently, if not usually, brings about only a *partial* detachment of the libido from objects, we can distinguish three groups of phenomena in the clinical picture: (1) those representing what remains of a normal state or of neurosis (residual phenomena); (2) those representing the morbid process (detachment of libido from its objects and, further, megalomania, hypochondria, affective disturbance and every kind of regression); (3) those representing restoration, in which the libido is once more attached to objects, after the manner of a hysteria (in dementia praecox or paraphrenia proper), or of an obsessional neurosis (in paranoia). This fresh libidinal cathexis differs from the primary one in that it starts from another level and under other conditions.[1] The difference [87] between the transference neuroses brought about in the case of this fresh kind of libidinal cathexis and the corresponding formations where the ego is normal should be able to afford us the deepest insight into the structure of our mental apparatus.

A third way in which we may approach the study of narcissism is by observing the erotic life of human beings, with its many kinds of differentiation in man and woman. Just as object libido at first concealed ego libido from our observation, so too in connection with the object choice of infants (and of growing children) what we first noticed was that they derived their sexual objects from their experiences of satisfaction. The first auto-erotic sexual satisfactions are experienced in connection with vital functions which serve the purpose of

1 [See some further remarks on this at the end of the paper on 'The Unconscious' (pp. 179–80 below).]

self-preservation. The sexual drives are at the outset attached to [*lehnen sich . . . an*]T the satisfaction of the ego drives; only later do they become independent of these, and even then we have an indication of that original attachment in the fact that the persons who are concerned with a child's feeding, care and protection become his earliest sexual objects: that is to say, in the first instance his mother or a substitute for her. Side by side, however, with this type and source of object choice, which may be called the 'anaclitic' or 'attachment' type [*Anlehnungstypus*],[1] psychoanalytic research has revealed a second [88] type, which we were not prepared for finding. We have discovered, especially clearly in people whose libidinal development has suffered some disturbance, such as perverts and homosexuals, that in their later choice of love objects they have taken as a model not their mother but their own selves. They are plainly seeking *themselves* as a love object, and are exhibiting a type of object choice which must be termed 'narcissistic'. In this observation we have the strongest of the reasons which have led us to adopt the hypothesis of narcissism.

Anlehnung

We have, however, not concluded that human beings are divided into two sharply differentiated groups, according as their object choice conforms to the anaclitic or to the narcissistic type; we assume rather that both kinds of object choice are open to each individual, though he may show a preference for one or the other. We say that a human being has originally two sexual objects – himself and the woman who nurses him – and in doing so we are postulating a primary narcissism in everyone, which may in some cases manifest itself in a dominating fashion in his object choice.

A comparison of the male and female sexes then shows that there are fundamental differences between them in respect of their type of object choice, although these differences are of course not universal. Complete object love of the attachment type is, properly speaking, characteristic of the male. It displays the marked sexual

1 [Literally 'leaning-on type'. The term has been rendered in English as the 'anaclitic type' by analogy with the grammatical term 'enclitic', used of particles which cannot be the first word in a sentence, but must be appended to, or must lean up against, a more important one, e.g. the Latin '*enim*' or the Greek '*δέ*'. This seems to be the first published appearance of the actual term '*Anlehnungstypus*'. The idea that a child arrives at its first sexual object on the basis of its nutritional drive is to be found in the first edition of the *Three Essays* (1905*d*), *RSE*, **7**, 196; but the two or three explicit mentions in that work of the 'anaclitic type' were not added to it until the 1915 edition. The concept was very clearly foreshadowed near the beginning of the second of Freud's papers on the psychology of love (1912*d*), ibid., **11**, 170. The term '*angelehnte*' ('attached') is used in a similar sense in Section III of the Schreber case history (1911*c*), ibid., **12**, 53 and *n.* 1, but the underlying hypothesis is not stated there. – It should be noted that the 'attachment' (or '*Anlehnung*') indicated by the term is that of the sexual drives to the ego drives, not of the child to its mother.]

overvaluation which is doubtless derived from the child's original narcissism and thus corresponds to a transference of that narcissism to the sexual object. This sexual overvaluation is the origin of the peculiar state of being in love, a state suggestive of a neurotic compulsion, which is thus traceable to an impoverishment of the ego as regards libido in favour of the love object.[1] A different course is followed in the type of female most frequently met with, which is probably the purest and truest one. With the onset of puberty the maturing of the female sexual organs, which up till then have been in a condition of latency, seems to bring about an intensification of the original narcissism, and this is unfavourable to the development of a true object choice with its accompanying sexual overvaluation. Women, especially if they grow up with good looks, develop a certain self-contentment which compensates them for the [89]
social restrictions that are imposed upon them in their choice of object. Strictly speaking, it is only themselves that such women love with an intensity comparable to that of the man's love for them. Nor does their need lie in the direction of loving, but of being loved; and the man who fulfils this condition is the one who finds favour with them. The importance of this type of woman for the erotic life of mankind is to be rated very high. Such women have the greatest fascination for men, not only for aesthetic reasons, since as a rule they are the most beautiful, but also because of a combination of interesting psychological factors. For it seems very evident that another person's narcissism has a great attraction for those who have renounced part of their own narcissism and are in search of object love. The charm of a child lies to a great extent in his narcissism, his self-contentment and inaccessibility, just as does the charm of certain animals which seem not to concern themselves about us, such as cats and the large beasts of prey. Indeed, even great criminals and humorists, as they are represented in literature, compel our interest by the narcissistic consistency with which they manage to keep away from their ego anything that would diminish it. It is as if we envied them for maintaining a blissful state of mind – an unassailable libidinal position which we ourselves have since abandoned. The great charm of narcissistic women has, however, its reverse side; a large part of the lover's dissatisfaction, of his doubts of the woman's love, of his complaints of her enigmatic nature, has its root in this incongruity between the types of object choice.

1 [Freud returned to this in a discussion of being in love in Chapter VIII of his *Group Psychology* (1921*c*), *RSE*, **18**, 103 ff.]

Perhaps it is not out of place here to give an assurance that this description of the feminine form of erotic life is not due to any tendentious desire on my part to depreciate women. Apart from the fact that tendentiousness is quite alien to me, I know that these different lines of development correspond to the differentiation of functions in a highly complicated biological whole; further, I am ready to admit that there are quite a number of women who love according to the masculine type and who also develop the sexual overvaluation proper to that type.

Even for narcissistic women, whose attitude towards men remains cool, there is a road which leads to complete object love. In the child
[90] which they bear, a part of their own body confronts them like an extraneous object, to which, starting out from their narcissism, they can then give complete object love. There are other women, again, who do not have to wait for a child in order to take the step in development from (secondary) narcissism to object love. Before puberty they feel masculine and develop some way along masculine lines; after this trend has been cut short on their reaching female maturity, they still retain the capacity of longing for a masculine ideal – an ideal which is in fact a survival of the boyish nature that they themselves once possessed.[1]

What I have so far said by way of indication may be concluded by a short summary of the paths leading to the choice of an object.

A person may love:

(1) According to the narcissistic type:

- (*a*) what he himself is (i.e. himself),
- (*b*) what he himself was,
- (*c*) what he himself would like to be,
- (*d*) someone who was once part of himself.

(2) According to the anaclitic (attachment) type:

- (*a*) the woman who feeds him,
- (*b*) the man who protects him,

and the succession of substitutes who take their place. The inclusion of case (*c*) of the first type cannot be justified till a later stage of this discussion. [p. 88 below.]

1 [Freud developed his views on female sexuality in a number of later papers: on a case of homosexuality in a woman (1920*a*), *RSE*, **18**, 139 ff., on the effects of the physiological distinctions between the sexes (1925*j*), ibid., **19**, 249 ff., on the sexuality of women (1931*b*), ibid., **21**, 215 ff., and in Lecture XXXIII of his *New Introductory Lectures* (1933*a*), ibid., **22**, 99 ff.]

The significance of narcissistic object choice for homosexuality in men must be considered in another connection.[1]

The primary narcissism of children which we have assumed, and which forms one of the postulates of our theories of the libido, is less easy to grasp by direct observation than to confirm by inference from elsewhere. If we look at the attitude of affectionate parents towards their children, we have to recognize that it is a revival and reproduction of their own narcissism, which they have long since abandoned. The trustworthy pointer constituted by overvaluation, which we have already recognized as a narcissistic stigma in the case of object choice, dominates, as we all know, their emotional attitude. Thus they are under a compulsion to ascribe every perfection to the child – which sober observation would find no occasion to do – and to conceal and forget all his shortcomings. (Incidentally, the denial [*Verleugnung*][T] of sexuality in children is connected with this.) Moreover, they are inclined to suspend in the child's favour the operation of all the cultural acquisitions which their own narcissism has been forced to respect, and to renew on his behalf the claims to privileges which were long ago given up by themselves. The child shall have a better time than his parents; he shall not be subject to the necessities which they have recognized as paramount in life. Illness, death, renunciation of enjoyment, restrictions on his own will, shall not touch him; the laws of nature and of society shall be abrogated in his favour; he shall once more really be the centre and core of creation – 'His Majesty the Baby',[2] as we once fancied ourselves. The child shall fulfil those wishful dreams of the parents which they never carried out – the boy shall become a great man and a hero in his father's place, and the girl shall marry a prince as a tardy compensation for her mother. At the most touchy point in the narcissistic system, the immortality of the ego, which is so hard pressed by reality, security is achieved by taking refuge in the child. Parental love, which is so moving and at bottom so childish, is nothing but the parents' narcissism born again, which, transformed into object love, unmistakably reveals its former nature. [91]

1 [Freud had already raised this point in Section III of his study on Leonardo (1910*c*), *RSE*, **11**, 90 ff.]

2 [In English in the original. Perhaps a reference to a well-known Royal Academy picture of the Edwardian age, which bore that title and showed two London policemen holding up the crowded traffic to allow a nursery-maid to wheel a perambulator across the street. – 'His Majesty the Ego' appears in Freud's earlier paper on 'Creative Writers and Daydreaming' (1908*e*), ibid., **9**, 128.]

III

[92] The disturbances to which a child's original narcissism is exposed, the reactions with which he seeks to protect himself from them and the paths into which he is forced in doing so – these are themes which I propose to leave on one side, as an important field of work which still awaits exploration. The most significant portion of it, however, can be singled out in the shape of the 'castration complex' (in boys, anxiety about the penis – in girls, envy for the penis) and treated in connection with the effect of early deterrence from sexual activity. Psychoanalytic research ordinarily enables us to trace the vicissitudes [*Schicksale*][T] undergone by the libidinal drives when these, isolated from the ego drives, are placed in opposition to them; but in the particular field of the castration complex, it allows us to infer the existence of an epoch and a psychical situation in which the two groups of drives, still operating in unison and inseparably mingled, make their appearance as narcissistic interests. It is from this context that Adler [1910] has derived his concept of the 'masculine protest', which he has elevated almost to the position of the sole driving force [*Triebkraft*] in the formation of character and neurosis alike and which he bases not on a narcissistic, and therefore still a libidinal, trend, but on a social valuation. Psychoanalytic research has from the very beginning recognized the existence and importance of the 'masculine protest', but it has regarded it, in opposition to Adler, as narcissistic in nature and derived from the castration complex. The 'masculine protest' is concerned in the formation of character, into the genesis of which it enters along with many other factors, but it is completely unsuited for explaining the problems of the neuroses, with regard to which Adler takes account of nothing but the manner in which they serve the ego drives. I find it quite impossible to place the genesis of neurosis upon the narrow basis of the castration complex, however powerfully it may come to the fore in men among their resistances to the cure of a neurosis. Incidentally, I know of cases of neurosis in which the 'masculine protest', or, as we regard it, the castration
[93] complex, plays no pathogenic part, and even fails to appear at all.[1]

1 [In a letter dated September 30, 1926, replying to a question from Dr Edoardo Weiss (who has kindly brought it to our attention), Freud wrote: 'Your question, in connection with my assertion in my paper on Narcissism, as to whether there are neuroses in which the castration complex plays no part, puts me in an embarrassing position. I no longer recollect what it was I had in mind

Observation of normal adults shows that their former megalomania has been damped down and that the psychical characteristics from which we inferred their infantile narcissism have been effaced. What has become of their ego libido? Are we to suppose that the whole amount of it has passed into object cathexes? Such a possibility is plainly contrary to the whole trend of our argument; but we may find a hint at another answer to the question in the psychology of repression [*Verdrängung*][T].

We have learnt that libidinal drive impulses undergo the vicissitude of pathogenic repression if they come into conflict with the subject's cultural and ethical ideas. By this we never mean that the individual in question has a merely intellectual knowledge of the existence of such ideas; we always mean that he recognizes them as a standard for himself and submits to the claims they make on him. Repression, we have said, proceeds from the ego; we might say with greater precision that it proceeds from the self-respect of the ego. The same impressions, experiences, impulses and desires that one man indulges or at least works over consciously will be rejected with the utmost indignation by another, or even stifled before they enter consciousness.[1] The difference between the two, which contains the conditioning factor of repression, can easily be expressed in terms which enable it to be explained by the libido theory. We can say that the one man has set up an *ideal* in himself by which he measures his actual ego, while the other has formed no such ideal. For the ego the formation of an ideal would be the conditioning factor of repression.[2] [94]

This ideal ego is now the target of the self-love [*Selbstliebe*] which was enjoyed in childhood by the actual ego. The subject's narcissism makes its appearance displaced on to this new ideal ego, which, like the infantile ego, finds itself possessed of every perfection that is of value. As always where the libido is concerned, man has here again shown himself incapable of giving up a satisfaction he had once enjoyed. He is not willing to forgo the narcissistic perfection of his childhood; and when, as he grows up, he is disturbed by the admonitions of others and by the awakening of his own critical judgement,

at the time. Today, it is true, I could not name any neurosis in which this complex is not to be met with, and in any case I should not have written the sentence today. But we know so little of the whole subject that I should prefer not to give a final decision either way.' – A further criticism of Adler's views on the 'masculine protest' can be found in the 'History of the Psychoanalytic Movement', p. 47 f. above.]

1 [Cf. some remarks in the paper on repression (1915*d*), below, p. 133.]

2 [A comment on this sentence can be found in a footnote to Chapter XI of *Group Psychology* (1921*c*), *RSE*, **18**, 122 *n*. 2.]

so that he can no longer retain that perfection, he seeks to recover it in the new form of an ego ideal. What he projects before him as his ideal is the substitute for the lost narcissism of his childhood in which he was his own ideal.[1]

We are naturally led to examine the relation between this forming of an ideal and sublimation. Sublimation is a process that concerns object libido and consists in the drive's directing itself towards an aim other than, and remote from, that of sexual satisfaction; in this process the accent falls upon deflection from sexuality. Idealization is a process that concerns the *object*; by it that object, without any alteration in its nature, is aggrandized and exalted in the subject's mind. Idealization is possible in the sphere of ego libido as well as in that of object libido. For example, the sexual overvaluation of an object is an idealization of it. Insofar as sublimation describes something that has to do with the drive and idealization something to do with the object, the two concepts are to be distinguished from each other.[2]

The formation of an ego ideal is often confused with the sublimation of drive, to the detriment of our understanding of the facts. A man who has exchanged his narcissism for homage to a high ego ideal has not necessarily on that account succeeded in sublimating his libidinal drives. It is true that the ego ideal demands such sublimation, but [95] it cannot enforce it; sublimation remains a special process which may be prompted by the ideal but the execution of which is entirely independent of any such prompting. It is precisely in neurotics that we find the highest differences of potential between the development of their ego ideal and the amount of sublimation of their primitive libidinal drives; and in general it is far harder to convince an idealist of the inexpedient location of his libido than a plain man whose pretensions have remained more moderate. Further, the formation of an ego ideal and sublimation are quite differently related to the causation of neurosis. As we have learnt, the formation of an ideal heightens the demands of the ego and is the most powerful factor favouring repression; sublimation is a way out, a way by which those demands can be met *without* involving repression.[3]

1 [In the editions previous to 1924 this read '. . . is only the substitute . . .']

2 [Freud returns to the topic of idealization in Chapter VIII of his *Group Psychology* (1921*c*), *RSE*, **18**, 104 f.]

3 [The possible connection between sublimation and the transformation of sexual object libido into narcissistic libido is discussed by Freud in Chapter III of *The Ego and the Id* (1923*b*), ibid., **19**, 26.]

It would not surprise us if we were to find a special psychical agency which performs the task of seeing that narcissistic satisfaction from the ego ideal is ensured and which, with this end in view, constantly watches the actual ego and measures it by that ideal.[1] If such an agency does exist, we cannot possibly come upon it as a *discovery* – we can only *recognize* it; for we may reflect that what we call our 'conscience' has the required characteristics. Recognition of this agency enables us to understand the so-called 'delusions of being noticed' or, more correctly, of being *watched*,[2] which are such striking symptoms in the paranoid diseases and which may also occur as an isolated form of illness, or intercalated in a transference neurosis. Patients of this sort complain that all their thoughts are known and their actions watched and supervised; they are informed of the functioning of this agency by voices which characteristically speak to them in the third person ('Now she's thinking of that again', 'now he's going out'). This complaint is justified; it describes the truth. A power [*Macht*][T] of this kind, watching, discovering and criticizing all our intentions, does really exist. Indeed, it exists in every one of us in normal life.

Delusions of being watched present this power in a regressive form, [96] thus revealing its genesis and the reason why the patient is in revolt against it. For what prompted the subject to form an ego ideal, on whose behalf his conscience acts as watchman, arose from the critical influence of his parents (conveyed to him by the medium of the voice), to whom were added, as time went on, those who trained and taught him and the innumerable and indefinable host of all the other people in his environment – his fellow men – and public opinion.

In this way large amounts of libido of an essentially homosexual kind are drawn into the formation of the narcissistic ego ideal and find outlet and satisfaction in maintaining it. The institution of conscience was at bottom an embodiment, first of parental criticism, and subsequently of that of society – a process which is repeated in what takes place when a tendency towards repression develops out of a prohibition or obstacle that came in the first instance from without. The voices, as well as the undefined multitude, are brought into the foreground again by the disease, and so the evolution of conscience is

1 [It was from a combination of this agency and the ego ideal that Freud was later to evolve the superego. Cf. Chapter XI of *Group Psychology* (1921*c*), *RSE*, **18**, 120 ff., and Chapter III of *The Ego and the Id* (1923*b*), ibid., **19**, 29 f.]

2 [The two German terms here are '*Beachtungswahn*' (usually translated 'delusions of observation') and *Beobachtungswahn*.]

reproduced regressively. But the revolt against this 'censoring agency' arises out of the subject's desire (in accordance with the fundamental character of his illness) to liberate himself from all these influences, beginning with the parental one, and out of his withdrawal of homosexual libido from them. His conscience then confronts him in a regressive form as a hostile influence from without.

The complaints made by paranoics also show that at bottom the self-criticism of conscience coincides with the self-observation on which it is based. Thus the activity of the mind which has taken over the function of conscience has also placed itself at the service of internal research, which furnishes philosophy with the material for its intellectual operations. This may have some bearing on the characteristic tendency of paranoics to construct speculative systems.[1]

[97] It will certainly be of importance to us if evidence of the activity of this critically observing agency – which becomes heightened into conscience and philosophic introspection – can be found in other fields as well. I will mention here what Herbert Silberer has called the 'functional phenomenon', one of the few indisputably valuable additions to the theory of dreams. Silberer, as we know, has shown that in states between sleeping and waking we can directly observe the translation of thoughts into visual images, but that in these circumstances we frequently have a representation [*Darstellung*], not of a thought content, but of the actual state (willingness, fatigue, etc.) of the person who is struggling against sleep. Similarly, he has shown that the conclusions of some dreams or some divisions in their content merely signify the dreamer's own perception of his sleeping and waking. Silberer has thus demonstrated the part played by observation – in the sense of the paranoic's delusions of being watched – in the formation of dreams. This part is not a constant one. Probably the reason why I overlooked it is because it does not play any great part in my own dreams; in persons who are gifted philosophically and accustomed to introspection it may become very evident.[2]

We may here recall that we have found that the formation of dreams takes place under the dominance of a censorship which

1 I should like to add to this, merely by way of suggestion, that the developing and strengthening of this observing agency might contain within it the subsequent genesis of (subjective) memory and the time factor, the latter of which has no application to unconscious processes. [For some further light on these two points see 'The Unconscious', pp. 165 and 166–7 below.]

2 [See Silberer (1909 and 1912). In 1914 – the year in which he wrote the present paper – Freud added a much longer discussion of this phenomenon to *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 450–3.]

compels distortion of the dream thoughts. We did not, however, picture this censorship as a special power, but chose the term to designate one side of the repressive trends that govern the ego, namely the side which is turned towards the dream thoughts. If we enter further into the structure of the ego, we may recognize in the ego ideal and in the dynamic utterances of conscience the *dream censor*[1] as well. If this censor is to some extent on the alert even during sleep, we can understand how it is that its suggested activity of self- [98]
observation and self-criticism – with such thoughts as, 'now he is too sleepy to think', 'now he is waking up' – makes a contribution to the content of the dream.[2]

At this point we may attempt some discussion of the self-regarding attitude [*Selbstgefühl*][t] in normal people and in neurotics.

In the first place self-regard appears to us to be an expression of the size of the ego; what the various elements are which go to determine that size is irrelevant. Everything a person possesses or achieves, every remnant of the primitive feeling of omnipotence which his experience has confirmed, helps to increase his self-regard.

Applying our distinction between sexual and ego drives, we must recognize that self-regard has a specially intimate dependence on narcissistic libido. Here we are supported by two fundamental facts: that in paraphrenics self-regard is increased, while in the transference neuroses it is diminished; and that in love relations not being loved lowers the self-regarding feelings, while being loved raises them. As we have indicated, the aim and the satisfaction in a narcissistic object choice is to be loved.[3]

Further, it is easy to observe that libidinal object cathexis does not raise self-regard. The effect of dependence upon the loved object is to lower that feeling: a person in love is humble. A person who loves has, so to speak, forfeited a part of his narcissism, and it can only be

1 [Here and at the beginning of the next sentence, as well as below on p. 87, Freud makes use of the personal form, '*Zensor*', instead of his almost universal '*Zensur*' ('censorship'). Cf. a footnote to the passage in *The Interpretation of Dreams*, referred to in footnote 2, p. 84 above (*RSE*, **5**, 452 *n.* 2). The distinction between the two words is clearly brought out in a sentence in Lecture XXVI of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 378: 'We know the self-observing agency as the ego censor, the conscience; it is this that exercises the dream censorship during the night.']

2 I cannot here determine whether the differentiation of the censoring agency from the rest of the ego is capable of forming the basis of the philosophic distinction between consciousness and self-consciousness.

3 [This subject is enlarged on by Freud in Chapter VIII of his *Group Psychology* (1921*c*), ibid., **18**, 105 f.]

replaced by his being loved. In all these respects self-regard seems to remain related to the narcissistic element in love.

The realization of impotence, of one's own inability to love, in consequence of mental or physical disorder, has an exceedingly lowering effect upon self-regard. Here, in my judgement, we must look for one of the sources of the feelings of inferiority which are experienced by patients suffering from the transference neuroses and which they are so ready to report. The main source of these feelings is, however, the impoverishment of the ego, due to the extraordinarily large libidinal
[99] cathexes which have been withdrawn from it – due, that is to say, to the injury sustained by the ego through sexual trends which are no longer subject to control.

Adler [1907] is right in maintaining that when a person with an active mental life recognizes an inferiority in one of his organs, it acts as a spur and calls out a higher level of performance in him through overcompensation. But it would be altogether an exaggeration if, following Adler's example, we sought to attribute every successful achievement to this factor of an original inferiority of an organ. Not all artists are handicapped with bad eyesight, nor were all orators originally stammerers. And there are plenty of instances of excellent achievements springing from *superior* organic endowment. In the aetiology of neuroses organic inferiority and imperfect development play an insignificant part – much the same as that played by currently active perceptual material in the formation of dreams. Neuroses make use of such inferiorities as a pretext, just as they do of every other suitable factor. We may be tempted to believe a neurotic woman patient when she tells us that it was inevitable she should fall ill, since she is ugly, deformed or lacking in charm, so that no-one could love her; but the very next neurotic will teach us better – for she persists in her neurosis and in her aversion to sexuality, although she seems more desirable, and is more desired, than the average woman. The majority of hysterical women are among the attractive and even beautiful representatives of their sex, while, on the other hand, the frequency of ugliness, organic defects and infirmities in the lower classes of society does not increase the incidence of neurotic illness among them.

The relations of self-regard to erotism – that is, to libidinal object cathexes – may be expressed concisely in the following way. Two cases must be distinguished, according to whether the erotic cathexes are ego-syntonic [*ichgerecht*][T], or, on the contrary, have suffered repression. In the former case (where the use made of the libido is

ego-syntonic), love is assessed like any other activity of the ego. Loving in itself, insofar as it involves longing and deprivation, lowers self-regard; whereas being loved, having one's love returned, and possessing the loved object, raises it once more. When libido is repressed, the erotic cathexis is felt as a severe depletion of the ego, the satisfaction of love is impossible, and the re-enrichment of the ego can be effected only by a withdrawal of libido from its objects. The return of [100]
the object libido to the ego and its transformation into narcissism represents,[1] as it were, a happy love once more; and, on the other hand, it is also true that a real happy love corresponds to the primal condition in which object libido and ego libido cannot be distinguished.

The importance and extensiveness of the topic must be my justification for adding a few more remarks which are somewhat loosely strung together.

The development of the ego consists in a departure from primary narcissism and gives rise to a vigorous attempt to recover that state. This departure is brought about by means of the displacement of libido on to an ego ideal imposed from without; and satisfaction is brought about from fulfilling this ideal.

At the same time the ego has sent out the libidinal object cathexes. It becomes impoverished in favour of these cathexes, just as it does in favour of the ego ideal, and it enriches itself once more from its satisfactions in respect of the object, just as it does by fulfilling its ideal.

One part of self-regard is primary – the residue of infantile narcissism; another part arises out of the omnipotence which is corroborated by experience (the fulfilment of the ego ideal), while a third part proceeds from the satisfaction of object libido.

The ego ideal has imposed severe conditions upon the satisfaction of libido through objects; for it causes some of them to be rejected by means of its censor,[2] as being incompatible. Where no such ideal has been formed, the sexual trend in question makes its appearance unchanged in the personality in the form of a perversion. To be their own ideal once more, in regard to sexual no less than other trends, as they were in childhood – this is what people strive to attain as their happiness.

1 [*'darstellt.'* In the first edition only: '*herstellt*', 'establishes'.]

2 [See footnote 1, p. 85 above.]

Being in love consists in a flowing over of ego libido on to the object. It has the power to remove repressions and reinstate perversions [*Perversionen wieder herzustellen*][t]. It exalts the sexual object into a sexual ideal. Since, with the object type (or attachment
[101] type), being in love occurs by virtue of the fulfilment of infantile conditions for loving, we may say that whatever fulfils that condition is idealized.

The sexual ideal may enter into an interesting auxiliary relation to the ego ideal. It may be used for substitutive satisfaction where narcissistic satisfaction encounters real hindrances. In that case a person will love in conformity with the narcissistic type of object choice, will love what he once was and no longer is, or else what possesses the excellences which he never had at all (cf. (*c*) [p. 78 above]). The formula parallel to the one there stated runs thus: what possesses the excellence which the ego lacks for making it an ideal is loved. This expedient is of special importance for the neurotic, who, on account of his excessive object cathexes, is impoverished in his ego and is incapable of fulfilling his ego ideal. He then seeks a way back to narcissism from his prodigal expenditure of libido upon objects, by choosing a sexual ideal after the narcissistic type which possesses the excellences to which he cannot attain. This is the cure by love, which he generally prefers to cure by analysis. Indeed, he cannot believe in any other mechanism of cure; he usually brings expectations of this sort with him to the treatment and directs them towards the person of the physician. The patient's incapacity for love, resulting from his extensive repressions, naturally stands in the way of a therapeutic plan of this kind. An unintended result is often met with when, by means of the treatment, he has been partially freed from his repressions: he withdraws from further treatment in order to choose a love object, leaving his cure to be continued by a life with someone he loves. We might be satisfied with this result, if it did not bring with it all the dangers of a crippling dependence upon his helper in need.

The ego ideal opens up an important avenue for the understanding of group psychology. In addition to its individual side, this ideal has a social side; it is also the common ideal of a family, a class or a nation. It binds not only a person's narcissistic libido, but also a considerable amount of his homosexual libido,[1] which is in this way turned back

1 [The importance of homosexuality in the structure of groups had been hinted at in *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 132 f., and was again referred to in *Group Psychology* (1921*c*), ibid., **18**, 116 *n*. 1 and 131 f.]

into the ego. The want of satisfaction which arises from the non-fulfilment of this ideal liberates homosexual libido, and this is [102] transformed into a sense of guilt (social anxiety). Originally this sense of guilt was a fear of punishment by the parents, or, more correctly, the fear of losing their love; later the parents are replaced by an indefinite number of fellow men. The frequent causation of paranoia by an injury to the ego, by a frustration of satisfaction within the sphere of the ego ideal, is thus made more intelligible, as is the convergence of ideal formation and sublimation in the ego ideal, as well as the involution of sublimations and the possible transformation of ideals in paraphrenic disorders.

Papers on Metapsychology

[1915]

PAPERS ON METAPSYCHOLOGY

EDITORS' INTRODUCTION

Freud published his first extended account of his views on psychological theory in [105]
the seventh chapter of *The Interpretation of Dreams* (1900*a*), which incorporated, in a transmuted form, much of the substance of his earlier, unpublished 'Project' (1950*a* [1895]). Apart from occasional short discussions, such as the one in Chapter VI of his book on *Jokes* (1905*c*), ten years passed before he again began to enter deeply into theoretical problems. An exploratory paper on 'The Two Principles of Mental Functioning' (1911*b*) was followed by other more or less tentative approaches – in Part III of his Schreber analysis (1911*c*), in his English paper on the unconscious (1912*g*), and in the long discussion of narcissism (1914*c*). Finally, in the spring and summer of 1915, he once more undertook a full-length and systematic exposition of his psychological theories.

The five papers which follow (and to a lesser extent the sixth one) form an interconnected series. As we learn from a footnote to the fourth of them (p. 197 *n.* 1 below), they are part of a collection which Freud had originally planned to publish in book form under the title *Zur Vorbereitung einer Metapsychologie* (Preliminaries to a Metapsychology).[1] He adds that the intention of the series was to provide a stable theoretical foundation for psychoanalysis.

Though the first three of these papers were published in 1915 and the fourth and fifth in 1917, we learn from Ernest Jones (1955, 208) that the initial five papers were in fact all written in a period of some seven weeks between March 15 and May 4, 1915. We also learn from Jones (ibid., 209) that seven more papers were added to the series during the following three months, the whole collection of twelve being completed by August 9. These further seven papers, however, were never published by Freud and it seems probable that at some later date he destroyed them, for no trace of them [106]
has been found and indeed their very existence was unknown or forgotten until Jones came to examine Freud's letters. Many years after Jones's death, however, in 1983 Ilse Grubrich-Simitis discovered among Ferenczi's papers a draft of the last paper in the series, 'Overview of the Transference Neuroses', which is found on p. 239 ff. below.

At the time he was writing the metapsychological papers in 1915 Freud kept his correspondents (Abraham, Ferenczi and Jones) informed of his progress; and there are several references to them afterwards. For example, in a letter to Abraham in November, 1917, which must have been written at about the time of publication of

1 In *GS*, **5** (1924), 432, the paper written by Freud for the Society for Psychical Research (1912*g*) is included under the rubric 'Papers on Metapsychology' along with the initial five papers. It did not, however, form part of the original collection.

the last two papers to appear, Freud seems to imply that the seven others were still in existence and that he still intended to publish them, though he felt that an opportune moment had not yet arrived. (Cf. Freud, 1965*a*.)

However, by April 2, 1919, if not earlier, Freud seems to have all but abandoned his original plan; for in a letter of that date to Lou Andreas-Salomé, who had enquired about the fate of the book on metapsychology, he wrote: 'Where is my metapsychology? In the first place it remains unwritten. Working over material systematically is not possible for me; the fragmentary nature of my observations and the sporadic character of my insights will not permit it. If, however, I should live another ten years . . .'.[1]

The assumption that Freud ultimately rejected the last seven papers as unsatisfactory is suggested by this exchange. He later confirmed the assumption in his *Autobiographical Study* (1925*d*), *RSE*, **20**, 51: 'The attempt remained no more than a torso . . . since the time for theoretical predications of this kind had not yet come'. By the end of the war, when it became possible to publish these papers, Freud presumably could no longer regard the manuscripts as an adequate synthesis of his theoretical views. For in the meantime precisely these views had begun to change fundamentally. He was just then conceptualizing his second drive theory, the structural model was beginning to crystallize, and the outlines of a new theory of anxiety may already have emerged.[2]

Freud's correspondences reveal the subjects with which five of the last seven papers dealt: Consciousness, Anxiety, Conversion Hysteria, Obsessional Neurosis and the Transference Neuroses in General; and we can detect possible references to them in the surviving papers. We can even guess the subjects which the two unspecified papers may have discussed – namely, Sublimation and Projection[3] (or Paranoia) – for there are fairly plain allusions to these. The collection of twelve papers would thus have been a comprehensive one, dealing with the underlying processes in most of the principal neuroses and psychoses as well as in dreams, with the mental mechanisms of repression, sublimation, introjection and projection, and with the two mental systems of consciousness and the unconscious.

1 The original existence of the twelve papers is confirmed by several passages in Freud's correspondence. For instance, in a letter to J. J. Putnam of July 8, 1915, he writes: 'I myself am using the break in my work [due to the war] at this time to finish off a book containing a collection of twelve psychological essays.' (Freud, 1960*a*.) Also in another, of July 30, 1915, to Lou Andreas-Salomé: 'Fruit of the present time will probably take the form of a book consisting of 12 essays beginning with the one on drives and their vicissitudes. . . . The book is finished except for the necessary revision caused by the arranging and fitting in of the individual essays.' In a further letter to Lou Andreas-Salomé of May 25, 1916: 'My book containing 12 essays of this kind cannot be published before the end of the war, and who knows *how* long after that ardently longed-for date.' Freud also mentions the existence of the 'twelve' essays and his intention of publishing them after the war in a letter of December 17, 1915, to Ludwig Binswanger (Freud, 1956*m*).

2 The new theory was put forward in *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20**, but there is already an indication of the concept of signal anxiety in 'The Unconscious' (1915*e*, p. 162 *n*. 2 below). On the other hand, the paper on anxiety among the lost metapsychological essays of 1915 may still have been based largely on the earlier toxicological theory of anxiety. At least, the statements in the draft of the 'Overview of the Transference Neuroses' support this assumption.

3 In Part III of the Schreber analysis (1911*c*), *RSE*, **12**, 57, Freud discussed the mechanism of projection, but professed himself dissatisfied and promised to consider it more fully in a later work. This he seems never to have done, unless it was in one of these missing papers.

It is difficult to exaggerate our loss from the disappearance of these papers. There was a unique conjunction of favourable factors at the time at which Freud wrote them. His previous major theoretical work (the seventh chapter of *The Interpretation of Dreams*) had been written fifteen years before, at a relatively early stage of his psychological studies. Now, however, he had some twenty-five years of psychoanalytic experience behind him on which to base his theoretical constructions, while he remained at the summit of his intellectual powers. And it was at this time that the accidental circumstance of the shrinking of his practice owing to the outbreak of the First World War gave him the necessary leisure for five months in which to carry [107]
through his attempt. We may try to console ourselves, no doubt, with the reflection that much of the contents of the lost papers must have found its way into Freud's later writings. But we would give a great deal to possess connected discussions on such questions as consciousness or sublimation in place of the scattered and relatively meagre allusions with which we have, in fact, to rest satisfied.

In view of the special importance of this series of papers, the closeness of their reasoning and the occasional abstruseness of the topics with which they deal, particular efforts have been made to render them with accuracy. The translation has throughout (and especially where there are doubtful passages) been kept as close as possible to the German, even at the risk of its reading stiffly. (Such un-English terms, for instance, as 'the repressed' and 'the mental' have been freely used.) Although the version published in 1925 was taken as a basis for the 1957 *SE* translation, the latter was in effect an entirely new one (reprinted here in a modified and corrected form). It also seemed reasonable to include more than the usual quantity of introductory material, to annotate the text very freely, and in particular to give ample references to other parts of Freud's writings which may throw light on any obscurities. A list of the more important of his theoretical works can be found in an Appendix at the end of the series (p. 255 below).

'Drives and their Fates'
2005 *PMC*, *The Unconscious*, 11–31. (Tr. Graham Frankland.)

The present translation, with a slightly altered title, is a revised and corrected reprint of the *SE* version.

Freud began writing this paper on March 15, 1915; it and the following one ('Repression') had been completed by April 4.

It should be remarked by way of preface that here (and throughout the *RSE*) the German word '*Trieb*' has been translated as 'drive'. The choice of this English equivalent rather than the alternative 'instinct' which was selected by Strachey in the original *SE* is discussed in the translation notes in Volume 24 of this revised edition.[1]

There is an ambiguity in Freud's use of the term '*Trieb*' ('drive') and '*Triebrepräsentanz*' ('drive representative') to which, for the sake of clearer understanding, attention must be drawn. On p. 107 below he describes a drive as 'a concept on the [112]

1 The other term in the title of this paper also calls for comment: '*Schicksale*', which is here (as in the *SE*) translated as 'vicissitudes'. For a full discussion of this translation, see *RSE*, **24**, 82.

frontier between the mental and the somatic, . . . the psychical representative[1] of the stimuli originating from within the organism and reaching the mind'. He had twice before given descriptions in almost the same words. Some years earlier, in Section III of his discussion of the case of Schreber (1911*c*), he wrote of drive as 'a concept on the frontier between the somatic and the mental . . ., the psychical representative of organic forces'; *RSE*, **12**, 64. And again, in a passage probably written a few months before the present paper and added to the third edition (published in 1915, but with a Preface dated 'October, 1914') of his *Three Essays* (1905*d*), ibid., **7**, 149, he wrote of drive as 'the psychical representative of an endosomatic, continuously flowing source of stimulation . . . the concept . . . lying on the frontier between the mental and the physical'. These three accounts seem to make it plain that Freud was drawing no distinction between a drive and its 'psychical representative'. He was apparently regarding the drive itself as the psychical representative of somatic forces. If now, however, we turn to the later papers in this series, we seem to find him drawing a very sharp distinction between the drive and its psychical representative. This is perhaps shown most clearly in a passage in 'The Unconscious' (pp. 156–7 below): 'A drive can never become an object of consciousness – only the idea [*Vorstellung*] that represents the drive can. Even in the unconscious, moreover, a drive cannot be represented otherwise than by an idea. . . . When we nevertheless speak of an unconscious drive impulse or of a repressed drive impulse . . . we can only mean a drive impulse the ideational representative of which is unconscious.'
[113] This same view appears in many other passages. For instance, in 'Repression' (p. 131) Freud speaks of 'the psychical (ideational) representative of the drive' and goes on: '. . . the representative in question persists unaltered . . . and the drive remains attached to it'; and again, in the same paper (p. 135), he writes of a drive representative as 'an idea or group of ideas which is cathected with a definite quota of psychical energy (libido or interest) coming from a drive', and proceeds to say that 'besides the idea, some other element representing the drive has to be taken into account' (namely the quota of affect). In this second group of quotations, therefore, the drive is no longer regarded as being the psychical representative of somatic impulses but rather as itself being something non-psychical. Both of these apparently differing views of the nature of a drive are to be found elsewhere in Freud's later writings, though the second predominates. It may be, however, that the contradiction is more apparent than real, and that its solution lies precisely in the ambiguity of the concept itself – a frontier concept between the physical and the mental.

In a number of passages Freud expressed his dissatisfaction with the state of psychological knowledge about the drives. Not long before, for instance, in his paper on narcissism (1914*c*, p. 67 above), he had complained of 'the total absence of any theory of the drives which would help us to find our bearings'. Later, too, in *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 34, he wrote of the drives as 'at once

1 The German word here and in the Schreber quotation is '*Repräsentant*', a particularly formal word used mainly in legal or constitutional language. In all the other quotations which follow, as well as almost invariably later, Freud writes '*Repräsentanz*', which is a more abstract form and would be better rendered by 'representance' if it existed, or by 'representation' if it were not so exceedingly ambiguous. ('*Vertretung*', the ordinary German word for 'representation', appears in a parallel passage in the original text of Freud's *Encyclopaedia Britannica* article, 1926*f*.) In many places Freud uses the compound '*Triebrepräsentanz*', which means 'representative of a drive' but is usually abbreviated here into 'drive representative'.

the most important and the most obscure element of psychological research', and in his *Encyclopaedia Britannica* article (1926*f*), *RSE*, **20**, 249, he confessed that for 'psychoanalysis, no less than in other sciences, the theory of the drives is an obscure subject'. The present paper is a relatively early attempt to deal with the subject comprehensively. Its many successors corrected and supplemented it at a number of points, but it nevertheless holds the field as the clearest account of what Freud understood by the drives and of the way in which he thought they operated. Subsequent reflection, it is true, led him to alter his views on their classification as well as on their deeper determinants; but this paper is an indispensable basis for understanding the developments that were to follow.

The course of Freud's changing views on the classification of the drives may perhaps be appropriately summarized here. It is a surprising fact that the drives make their explicit appearance at a comparatively late point in the sequence of his writ- [114]
ings. The word 'drive' is scarcely to be found in the works of the Breuer period or in the Fliess correspondence or even in *The Interpretation of Dreams* (1900*a*). Not until the *Three Essays* (1905*d*) is the 'sexual drive' freely mentioned as such; the 'drive impulses',[1] which were to become one of Freud's commonest terms, seem not to appear till the paper on 'Obsessive Actions and Religious Practices' (1907*b*). But this is mainly no more than a *verbal* point: the 'drives' were of course there under other names. Their place was taken to a great extent by such things as 'excitations', 'affective ideas', 'wishful impulses', 'endogenous stimuli', and so on. For instance, a distinction is drawn below (p. 104) between a 'stimulus', which operates as a force giving a single impact, and a 'drive', which always operates as a constant one. This precise distinction had been drawn by Freud twenty years earlier in almost identical words except that instead of 'stimulus' and 'drive' he spoke of 'exogenous' and 'endogenous excitations'.[2] Similarly, Freud points out below (p. 105) that the primitive organism cannot take evasive action against drive needs as it can against external stimuli. In this case too he had anticipated the idea twenty years before, though once again the term used was 'endogenous stimuli'. This second passage, in Section 1 of Part I of the 'Project' (1950*a* [1895]), *RSE*, **1**, 321, goes on to say that these endogenous stimuli 'have their origin in the cells of the body and give rise to the major needs: hunger, respiration, sexuality', but nowhere here is the actual word 'drive' to be found.

The conflict which underlies the psychoneuroses was at this early period sometimes described as being between 'the ego' and 'sexuality'; and though the term 'libido' was often used, the concept was of a manifestation of 'somatic sexual tension', which in its turn was regarded as a chemical event. Only in the *Three Essays* was libido explicitly established as an expression of the sexual drive. The other party to the conflict, 'the ego', remained undefined for much longer. It was chiefly discussed in connection with its functions – in particular 'repression', 'resistance' and 'reality-testing' – but (apart from a very early attempt in Section 14 of Part I of the [115]
'Project') little was said either of its structure or dynamics.[3] The 'self-preservative'

1 '*Triebregungen*' (see *RSE*, **24**, 88).

2 See Section III of Freud's first paper on anxiety neurosis (1895*b*), ibid., **3**, 100.

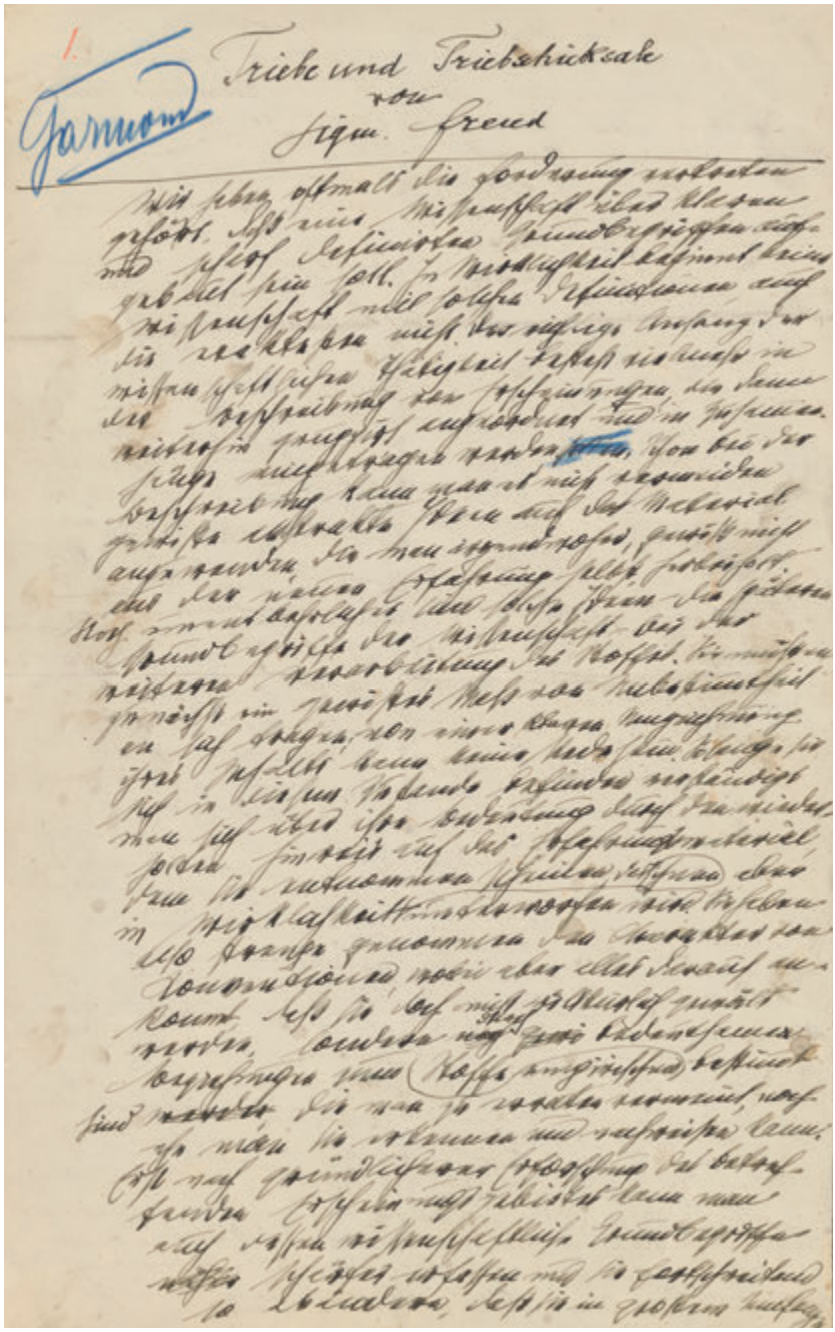
3 Cf. the end of the Editors' Note to the paper on Narcissism (p. 62 above), and a discussion of 'reality-testing' in the Editors' Note to 'A Metapsychological Supplement to the Theory of Dreams' (p. 196 below).

drives had scarcely ever been referred to, except indirectly in connection with the theory that the libido had attached itself to them in the earlier phases of its development;[1] and there seemed no obvious reason for connecting them with the part played by the ego as the repressive agent in neurotic conflicts. Then, with apparent suddenness, in a short paper on psychogenic disturbance of vision (1910*i*), Freud introduced the term 'ego drives' and identified these on the one hand with the self-preservative drives and on the other with the repressive function. From this time forward the conflict was regularly represented as being between two sets of drives – the libido and the ego drives.

The introduction of the concept of 'narcissism', however, raised a complication. In his paper on that theory (1914*c*), Freud advanced the notion of 'ego libido' (or 'narcissistic libido') which cathects the ego, as contrasted with 'object libido' which cathects objects (p. 65 f. above). A passage in that paper (loc. cit.) as well as a remark in the present one (p. 109) show that he was already feeling uneasy as to whether his 'dualistic' classification of the drives would hold. It is true that in the Schreber analysis (1911*c*) he insisted on the difference between 'ego cathexes' and 'libido' and between 'interest emanating from erotic sources' and 'interest in general' – a distinction which reappears in the rejoinder to Jung in the paper on narcissism (pp. 69–70 above). The term 'interest' is used again in the present paper (p. 119); and in Lecture XXVI of the *Introductory Lectures* (1916–17*a*) 'ego interest' or simply 'interest' is regularly contrasted with 'libido'. Nevertheless, the exact nature of these non-libidinal drives was obscure. The turning point in Freud's classification of the drives was reached in *Beyond the Pleasure Principle* (1920*g*). In Chapter VI of that work he frankly recognized the difficulty of the position that had been reached, and explicitly
[116] declared that 'narcissistic libido was of course also a manifestation of the force of the sexual drive' and that 'it had necessarily to be identified with the "self-preservative drives".' (*RSE*, **18**, 48 ff.) He still held, however, that there were ego drives and object drives other than libidinal ones; and it was here that, still adhering to a dualistic view, he introduced his hypothesis of the death drive. An account of the development of his views on the classification of the drives up to that point was given in the long footnote at the end of Chapter VI of *Beyond the Pleasure Principle*, ibid., **18**, 57 f. *n.*, and a further discussion of the subject, in the light of his newly completed picture of the structure of the mind, occupied Chapter IV of *The Ego and the Id* (1923*b*). He traversed the whole ground once again in much detail in Chapter VI of *Civilization and its Discontents* (1930*a*), and he there for the first time gave special consideration to the aggressive and destructive drives. He had earlier paid little attention to these except where (as in sadism and masochism) they were fused with libidinal elements; but he now discussed them in their pure form and explained them as derivatives of the death drive. A still later review of the subject can be found in the second half of Lecture XXXII of the *New Introductory Lectures* (1933*a*) and a final summary in Chapter II of the posthumous *Outline of Psychoanalysis* (1940*a* [1938]).[2]

1 See, for instance, a passage in the *Three Essays*, *RSE*, **7**, 161–2, where, however, the explicit mention of self-preservation was added in 1915.

2 Some remarks on the destructive drive and the possibility of its sublimation are contained in two letters of Freud's to Princess Marie Bonaparte of May 27 and June 17, 1937. They are printed in Appendix A (Nos. 33 and 34) of the third volume of Ernest Jones's biography (1957).



First page of the fair copy of ‘Drives and their Vicissitudes’

First page of the fair copy of 'Drives and their Vicissitudes'

On p. 107 of this volume, Freud writes: 'A "drive" appears to us as a concept on the frontier between the mental and the somatic [. . .] as a measure of the demand made upon the mind for work in consequence of its connection with the body.' Twenty years earlier, in the 'Project for a Scientific Psychology', Freud had written: 'A direct pathway leads from the interior of the body to ψ neurons. If this is so, however, ψ is exposed to Qs on this side without protection and in this fact lies the *mainspring* of the psychical mechanism.' (*RSE*, **1**, 340.)

DRIVES AND THEIR VICISSITUDES

We have often heard it maintained that sciences should be built up on [117]
clear and sharply defined basic concepts. In actual fact no science, not even the most exact, begins with such definitions. The true beginning of scientific activity consists rather in describing phenomena and then in proceeding to group, classify and correlate them. Even at the stage of description it is not possible to avoid applying certain abstract ideas [*Ideen*][T] to the material in hand, ideas derived from somewhere or other but certainly not from the new observations alone. Such ideas – which will later become the basic concepts of the science – are still more indispensable as the material is further worked over. They must at first necessarily possess some degree of indefiniteness; there can be no question of any clear delimitation of their content. So long as they remain in this condition, we come to an understanding about their meaning by making repeated references to the material of observation from which they appear to have been derived, but upon which, in fact, they have been imposed. Thus, strictly speaking, they are in the nature of conventions – although everything depends on their not being arbitrarily chosen but determined by their having significant relations to the empirical material, relations that we seem to sense before we can clearly recognize and demonstrate them. It is only after more thorough investigation of the field of observation that we are able to formulate its basic scientific concepts with increased precision, and progressively so to modify them that they become serviceable and consistent over a wide area. Then, indeed, the time may have come to confine them in definitions. The advance of knowledge, however, does not tolerate any rigidity even in definitions. Physics furnishes an excellent illustration of the way in which even 'basic concepts' that have been established in the form of definitions are constantly being altered in their content.[1]

A conventional basic concept of this kind, which at the moment is still [118]

1 [A similar line of thought had been developed in the paper on narcissism (1914*c*, p. 66 f. above).]

somewhat obscure but which is indispensable to us in psychology, is that of a 'drive' ['*Triebes*']^{T}. Let us try to give a content to it by approaching it from different angles.

First, from the angle of *physiology*. This has given us the concept of a 'stimulus' ['*Reizes*'] and the pattern of the reflex arc, according to which a stimulus applied to living tissue (nervous substance) *from* the outside is discharged [*abgeführt*]^{T} by action *to* the outside. This action is expedient insofar as it withdraws the stimulated substance from the influence of the stimulus, removes it out of its range of operation.

abführen

What is the relation of 'drive' to 'stimulus'? There is nothing to prevent our subsuming the concept of 'drive' under that of 'stimulus' and saying that a drive is a stimulus applied to the mind [*das Psychische*]. But we are immediately set on our guard against *equating* drive and mental stimulus. There are obviously other stimuli to the mind besides those of the drives, stimuli which behave far more like physiological ones. For example, when a strong light falls on the eye, it is not a drive stimulus; it *is* one, however, when a dryness of the mucous membrane of the pharynx or an irritation of the mucous membrane of the stomach makes itself felt.[1]

We have now obtained the material necessary for distinguishing between drive stimuli and other (physiological) stimuli that operate on the mind. In the first place, a drive stimulus does not arise from the external world but from within the organism itself. For this reason it operates differently upon the mind and different actions are necessary in order to remove it. Further, all that is essential in a stimulus is covered if we assume that it operates with a single impact, so that it can be disposed of by a single expedient action. A typical instance of this is motor flight from the source of stimulation. These impacts may, of course, be repeated and summated, but that makes no difference to our notion of the process and to the conditions for the removal of the stimulus. A drive, on the other hand, never operates as a force [*Kraft*]^{T} giving a *momentary* impact but always as a *constant* one. Moreover, since it impinges not from without but from within the organism, no flight can avail against it. A better term for a drive stimulus is a 'need'. What does away with a need is 'satisfaction'. This can be attained only by an appropriate ('adequate') alteration of the internal source of stimulation.

[119]

Let us imagine ourselves in the situation of an almost entirely helpless living organism, as yet unorientated in the world, which is receiving

1 Assuming, of course, that these internal processes are the organic basis of the respective needs of thirst and hunger.

stimuli in its nervous substance.[1] This organism will very soon be in a position to make a first distinction and a first orientation. On the one hand, it will be aware of stimuli which can be avoided by muscular action (flight); these it ascribes to an external world. On the other hand, it will also be aware of stimuli against which such action is of no avail and whose character of constant pressure persists in spite of it; these stimuli are the signs of an internal world, the evidence of drive needs. The perceptual substance of the living organism will thus have found in the efficacy of its muscular activity a basis for distinguishing between an 'outside' and an 'inside'.[2]

We thus arrive at the essential nature of drives in the first place by considering their main characteristics – their origin in sources of stimulation within the organism and their appearance as a constant force – and from this we deduce one of their further features, namely, that no actions of flight avail against them. In the course of this discussion, however, we cannot fail to be struck by something that obliges us to make a further admission. In order to guide us in dealing with the field of psychological phenomena, we do not merely apply certain conventions to our empirical material as basic *concepts*; we also make use of a number [120]
of complicated *postulates*. We have already alluded to the most important of these, and all we need now do is to state it expressly. This postulate is of a biological nature, and makes use of the concept of 'purpose' (or perhaps of expediency) and runs as follows: the nervous system is an apparatus which has the function of getting rid of the stimuli that reach it, or of reducing them to the lowest possible level; or which, if it were feasible, would maintain itself in an altogether unstimulated condition.[3] Let us for the present not take exception to the indefiniteness of this idea and let us assign to the nervous system the task – speaking in general terms – of *mastering stimuli*. We then see how greatly the simple pattern of the physiological reflex is complicated by the introduction of drives.

1 [The hypothesis which follows concerning the behaviour of a primitive living organism, and the postulation of a fundamental 'principle of constancy', had been stated in similar terms in some of the very earliest of Freud's psychological works. See, for instance, Chapter VII, Sections C and E, of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 505 ff. and 535 ff. But it had been expressed still earlier in *neurological* terms in his posthumously published 'Project' of 1895 (1950*a*, Part I, Section 1), ibid., **1**, as well as, more briefly, in his lecture on the Breuer & Freud 'Preliminary Communication' (1893*h*), ibid., **3**, and in the penultimate paragraph of his French paper on hysterical paralyses (1893*c*), *NSW*, **4**; *RSE*, **1**. Freud returned to the hypothesis once more, in Chapters I and IV of *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 7 ff. and 25 ff.; and reconsidered it in 'The Economic Problem of Masochism' (1924*c*), ibid., **19**, 152 f. Cf. footnote, p. 106 f. below.]

2 [See further below, p. 117 ff. Freud dealt with the subject later in his paper on 'Negation' (1925*h*), *RSE*, **19**, 238–9, and in Chapter I of *Civilization and its Discontents* (1930*a*), ibid., **21**, 61 f.]

3 [This is the 'principle of constancy'. See footnote 1 above.]

External stimuli impose only the single task of withdrawing from them; this is accomplished by muscular movements, one of which eventually achieves that aim and thereafter, being the expedient movement, becomes a hereditary disposition. Drive stimuli, which originate from within the organism, cannot be dealt with by this mechanism. Thus they make far higher demands on the nervous system and cause it to undertake involved and interconnected activities by which the external world is so changed as to afford satisfaction to the internal source of stimulation. Above all, they oblige the nervous system to renounce its ideal intention of keeping off stimuli, for they maintain an incessant and unavoidable afflux of stimulation. We may therefore well conclude that drives and not external stimuli are the true motive forces [*Motoren*] behind the advances that have led the nervous system, with its unlimited capacities, to its present high level of development. There is naturally nothing to prevent our supposing that the drives themselves are, at least in part, precipitates of the effects of external stimulation, which in the course of phylogenesis have brought about modifications in the living substance.

Seele *Lust* When we further find that the activity of even the most highly developed mental apparatus [*Seelenapparate*][T] is subject to the pleasure principle [*Lustprinzip*][T], i.e. is automatically regulated by feelings belonging to the pleasure–unpleasure series [*Lust–Unlustreihe*], we can hardly reject the further hypothesis that these feelings reflect the manner in which the process of mastering stimuli takes place – certainly in the [121] sense that unpleasurable feelings are connected with an increase and pleasurable feelings with a decrease of stimulus. We will, however, carefully preserve this assumption in its present highly indefinite form, until we succeed, if that is possible, in discovering what sort of relation exists between pleasure and unpleasure, on the one hand, and fluctuations in the amounts of stimulus affecting mental life [*Seelenleben*], on the other. It is certain that many very various relations of this kind, and not very simple ones, are possible.[1]

1 [It will be seen that two principles are here involved. One of these is the 'principle of constancy' (see above, p. 105 and footnote 1). It is stated again in *Beyond the Pleasure Principle* (1920*g*), Chapter I; *RSE*, **18**, 8–9, as follows: 'The mental apparatus endeavours to keep the quantity of excitation present in it as low as possible or at least to keep it constant.' For this principle Freud, in the same work (ibid., **18**, 53), adopted the term 'Nirvana principle'. The second principle involved is the 'pleasure principle', stated at the beginning of the paragraph to which this note is appended. It, too, is restated in *Beyond the Pleasure Principle* (ibid., **18**, 7): 'The course taken by mental events is automatically regulated by the pleasure principle. . . . [That course] takes a direction such that its final outcome coincides with . . . an avoidance of unpleasure or a production of pleasure.' Freud seems to have assumed to begin with that these two principles were closely correlated and even identical. Thus, in his 'Project' of 1895 (Freud, 1950*a*, Part I, Section 8) he

If now we apply ourselves to considering mental life from a *biological* point of view, a 'drive' appears to us as a concept on the frontier between [122] the mental and the somatic, as the psychical representative of the stimuli originating from within the organism and reaching the mind, as a measure of the demand made upon the mind for work in consequence of its connection with the body.[1]

We are now in a position to discuss certain terms which are used in reference to the concept of a drive – for example, its 'pressure', its 'aim', its 'object' and its 'source'.

By the pressure [*Drange*] of a drive we understand its motor factor, the amount of force or the measure of the demand for work which it represents. The characteristic of exercising pressure is common to all drives; it is in fact their very essence. Every drive is a piece of activity; if we speak loosely of passive drives, we can only mean drives whose *aim* is passive.[2]

The aim [*Ziel*] of a drive is in every instance satisfaction, which can only be obtained by removing the state of stimulation at the source of the drive. But although the ultimate aim of each drive remains unchangeable, there may yet be different paths leading to the same ultimate aim; so that a drive may be found to have various nearer or intermediate aims, which are combined or interchanged with one another. Experience permits us also to speak of drives which are 'inhibited in their aim' ['*zielgehemmten*'][T], in the case of processes which are allowed to make *Hemmung*

writes: 'Since we have certain knowledge of a trend in psychical life towards *avoiding unpleasure*, we are tempted to identify that trend with the primary trend towards inertia [i.e. towards avoiding excitation].' (*RSE*, **1**, 336.) A similar view is taken in Chapter VII (E) of *The Interpretation of Dreams* (1900*a*), ibid., **5**, 535. In the passage in the text above, however, a doubt appears to be expressed as to the completeness of the correlation between the two principles. This doubt is carried farther in *Beyond the Pleasure Principle* (ibid., **18**, 8 and 60) and is discussed at some length in 'The Economic Problem of Masochism' (1924*c*), ibid., **19**. Freud there argues that the two principles cannot be identical, since there are unquestionably states of increasing tension which are pleasurable (e.g. sexual excitement), and he goes on to suggest (what had already been hinted at in the two passages in *Beyond the Pleasure Principle* just referred to) that the pleasurable or unpleasurable quality of a state may be related to a *temporal* characteristic (or rhythm) of the changes in the quantity of excitation present. He concludes that in any case the two principles must not be regarded as identical: the pleasure principle is a *modification* of the Nirvana principle. The Nirvana principle, he maintains, is to be attributed to the 'death drive', and its modification into the pleasure principle is due to the influence of the 'life drive' or libido.]

1 [See the discussion in the Editors' Note, pp. 99–101 above. This last point also appears in the 1915 addition to the *Three Essays* (1905*d*), *RSE*, **7**, 149 f., and in Chapter II of the *Outline* (1940*a*), ibid., **23**, 134.]

2 [Some remarks on the active nature of drives can be found in a footnote added in 1915 to Section 4 of the third of Freud's *Three Essays* (1905*d*), ibid., **7**, 194 *n.* 1. – A criticism of Adler for misunderstanding this 'pressing' characteristic of drives appears at the end of the second section of Part III of the 'Little Hans' analysis (1909*b*), ibid., **10**, 106–7.]

some advance towards drive satisfaction but are then inhibited or deflected. We may suppose that even processes of this kind involve a partial satisfaction.

The object [*Objekt*] of a drive is the thing in regard to which or through which the drive is able to achieve its aim. It is what is most variable about a drive and is not originally connected with it, but becomes assigned to it only in consequence of being peculiarly fitted to make satisfaction possible. The object is not necessarily something extraneous: it may equally
[123] well be a part of the subject's own body. It may be changed any number of times in the course of the vicissitudes which the drive undergoes during its existence; and highly important parts are played by this displacement [*Verschiebung*][T] of drive. It may happen that the same object serves for the satisfaction of several drives simultaneously, a phenomenon which Adler [1908] has called a 'confluence' of drives [*Triebverschränkung*[t]].[1] A particularly close attachment of the drive to its object is distinguished by the term 'fixation' [*Fixierung*][T]. This frequently occurs at very early periods of the development of a drive and puts an end to its mobility through its intense opposition to detachment.[2]

By the source [*Quelle*] of a drive is meant the somatic process which occurs in an organ or part of the body and whose stimulus is represented in mental life by a drive. We do not know whether this process is invariably of a chemical nature or whether it may also correspond to the release of other, e.g. mechanical, forces. The study of the sources of drives lies outside the scope of psychology. Although drives are wholly determined by their origin in a somatic source, in mental life we know them only by their aims. An exact knowledge of the sources of a drive is not invariably necessary for purposes of psychological investigation; sometimes its source may be inferred from its aim.

Are we to suppose that the different drives which originate in the body and operate on the mind are also distinguished by different *qualities*, and that that is why they behave in qualitatively different ways in mental life? This supposition does not seem to be justified; we are much more likely to find the simpler assumption sufficient – that the drives are all qualitatively alike and owe the effect they make only to the amount of excitation they carry, or perhaps, in addition, to certain functions of that quantity. What distinguishes from one another the mental effects produced by the various drives may be traced to the difference in their sources. In any

1 [Two instances of this are given by Freud in the analysis of 'Little Hans' (1909*b*), *RSE*, **10**, 81 f. and 97.]

2 [Cf. below, p. 131.]

event, it is only in a later connection that we shall be able to make plain what the problem of the quality of drives signifies.[1]

What drives should we suppose there are, and how many? There is obviously a wide opportunity here for arbitrary choice. No objection can be made to anyone's employing the concept of a drive to play or to destruction or to gregariousness, when the subject matter demands it and the limitations of psychological analysis allow of it. Nevertheless, we should not neglect to ask ourselves whether drive motives [*Triebmotive*][T] like these, which are so highly specialized on the one hand, do not admit of further dissection in accordance with the *sources* of the drive, so that only primal drives – those which cannot be further dissected – can lay claim to importance. [124] *Motiv*

I have proposed that two groups of such primal drives should be distinguished: the *ego* [*Ich-*][T], or *self-preservative*, drives [*Selbsterhaltungstriebe*] and the *sexual* drives. But this supposition has not the status of a necessary postulate, as has, for instance, our assumption about the biological purpose of the mental apparatus [p. 105 above]; it is merely a working hypothesis, to be retained only so long as it proves useful, and it will make little difference to the results of our work of description and classification if it is replaced by another. The occasion for this hypothesis arose in the course of the evolution of psychoanalysis, which was first employed upon the psychoneuroses, or, more precisely, upon the group described as 'transference neuroses' [*Übertragungsneurosen*][T] (hysteria and obsessional neurosis); these showed that at the root of all such affections there is to be found a conflict between the claims of sexuality and those of the ego. It is always possible that an exhaustive study of the other neurotic affections (especially of the narcissistic psychoneuroses, the schizophrenias) may oblige us to alter this formula and to make a different classification of the primal drives. But for the present we do not know of any such formula, nor have we met with any argument unfavourable to drawing this contrast between sexual and ego drives.[2] *Übertragung*

I am altogether doubtful whether any decisive pointers for the differentiation and classification of the drives can be arrived at on the basis of working over the psychological material. This working over seems rather itself to call for the application to the material of definite assumptions concerning the life of the drives, and it would be a desirable thing if those

1 [It is not clear what 'later connection' Freud had in mind.]

2 [See the Editors' Note, p. 102 above.]

assumptions could be taken from some other branch of knowledge and
[125] carried over to psychology. The contribution which biology has to make here certainly does not run counter to the distinction between sexual and ego drives. Biology teaches that sexuality is not to be put on a par with other functions of the individual; for its purposes go beyond the individual and have as their content the production of new individuals – that is, the preservation of the species. It shows, further, that two views, seemingly equally well founded, may be taken of the relation between the ego and sexuality. On the one view, the individual is the principal thing, sexuality is one of its activities and sexual satisfaction one of its needs; while on the other view the individual is a temporary and transient appendage to the quasi-immortal germ-plasm, which is entrusted to him by the process of generation.[1] The hypothesis that the sexual function differs from other bodily processes by virtue of a special chemistry is, I understand, also a postulate of the Ehrlich school of biological research.[2]

Since a study of drive activity from the direction of consciousness presents almost insuperable difficulties, the principal source of our knowledge remains the psychoanalytic investigation of mental disturbances. Psychoanalysis, however, in consequence of the course taken by its development, has hitherto been able to give us information of a fairly satisfactory nature only about the *sexual* drives; for it is precisely that group which alone can be observed in isolation, as it were, in the psychoneuroses. With the extension of psychoanalysis to the other neurotic affections, we shall no doubt find a basis for our knowledge of the ego drives as well, though it would be rash to expect equally favourable conditions for observation in this further field of research.

This much can be said by way of a general characterization of the sexual drives. They are numerous, emanate from a great variety of organic sources, act in the first instance independently of one another and only achieve a more or less complete synthesis at a late stage. The
[126] aim which each of them strives for is the attainment of 'organ pleasure';[3]

1 [See footnote 1, p. 68 above. The same point is made in Lecture XXVI of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 365.]

2 [This hypothesis had already been announced by Freud in the first edition of his *Three Essays* (1905*d*), ibid., **7**, 191 *n*. 1. But he had held it for at least ten years previously. See, for instance, Draft I in the Fliess correspondence (1950*a*), probably written in 1895.]

3 ['Organ pleasure' (*Organlust*) (i.e. pleasure attached to one particular bodily organ) seems to be used here for the first time by Freud. The term is discussed at greater length in Lecture XXI of the *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 285–6. The underlying idea, of course, goes back much earlier. See, for instance, the opening passage of the third of the *Three Essays* (1905*d*), ibid., **7**, 183.]

only when synthesis is achieved do they enter the service of the reproductive function and thereupon become generally recognizable as sexual drives. At their first appearance they are attached to [*lehnen sich an*][T] the drives to self-preservation, from which they only gradually become separated; in their choice of object, too, they follow the paths that are indicated to them by the ego drives.[1] A portion of them remains associated with the ego drives throughout life and furnishes them with libidinal components, which in normal functioning easily escape notice and are revealed clearly only by the onset of illness.[2] They are distinguished by possessing the capacity to act vicariously for one another to a wide extent and by being able to change their objects readily. In consequence of the latter properties they are capable of functions which are far removed from their original purposive actions – capable, that is, of 'sublimation'. *Anlehnung*

Our inquiry into the various vicissitudes which drives undergo in the process of development and in the course of life must be confined to the sexual drives, which are the more familiar to us. Observation shows us that a drive may undergo the following vicissitudes:

Reversal into its opposite.
Turning round upon the subject's own self [*die eigene Person*][T].
Repression [*Verdrängung*][T].
Sublimation.

Since I do not intend to treat of sublimation here[3] and since repression requires a special chapter to itself [cf. next paper, p. 129 ff.], it only remains for us to describe and discuss the two first points. Bearing in mind that there are motives [*Motive*] which work against a drive's being carried through in an unmodified form, we may also regard these vicissitudes as modes of *defence* [*Abwehr*][T] against the drives. [127]

Reversal of a drive into its opposite resolves on closer examination into two different processes: *a change from activity to passivity*, and a *reversal of its content*. The two processes, being different in their nature, must be treated separately.

Examples of the first process are met with in the two pairs of opposites: sadism–masochism and scopophilia–exhibitionism [*Schaulust–Exhibition*][T]. The reversal affects only the *aims* of the drives. *Schaulust*

1 [Cf. 'On Narcissism', p. 75 f. above.]

2 [Ibid., p. 71 f.]

3 [Sublimation had already been touched upon in the paper on narcissism (p. 82); but it seems possible that it formed the subject of one of the lost metapsychological papers. (See Editors' Introduction, p. 93 ff. above.)]

The active aim (to torture, to look at) is replaced by the passive aim (to be tortured, to be looked at). Reversal of *content* is found in the single instance of the transformation of love into hate.

The *turning round of a drive upon the subject's own self* is made plausible by the reflection that masochism is actually sadism turned round upon the subject's own ego [*Ich*], and that exhibitionism includes looking at his own body. Analytic observation, indeed, leaves us in no doubt that the masochist shares in the enjoyment of the assault upon himself, and that the exhibitionist shares in the enjoyment of [the sight of] his exposure. The essence of the process is thus the change of the *object*, while the aim remains unchanged. We cannot fail to notice, however, that in these examples the turning round upon the subject's self and the transformation from activity to passivity converge or coincide.

To elucidate the situation, a more thorough investigation is essential.

In the case of the pair of opposites sadism–masochism, the process may be represented as follows:

(*a*) Sadism consists in the exercise of violence or power upon some other person as object.

(*b*) This object is given up and replaced with the subject's self. With the turning round upon the self the change from an active to a passive drive aim is also effected.

(*c*) An extraneous person is once more sought as object; this person, in consequence of the alteration which has taken place in the drive aim, has to take over the role of the subject.[1]

[128] Case (*c*) is what is commonly termed masochism. Here, too, satisfaction follows along the path of the original sadism, the passive ego placing itself back in phantasy [*phantastisch*][T] in its first role, which has now in fact been taken over by the extraneous subject.[2] Whether there is, besides this, a more direct masochistic satisfaction is highly doubtful. A primary masochism, not derived from sadism in the manner I have described, seems not to be met with.[3] That it is not superfluous to assume the existence of stage (*b*) is to be seen from the behaviour of the sadistic drive in obsessional neurosis. There there is a turning round upon the

Phantasie

1 [Though the general sense of these passages is clear, there may be some confusion in the use of the word 'subject'. As a rule 'subject' and 'object' are used respectively for the person in whom a drive (or other state of mind) originates, and the person or thing to which it is directed. Here, however, 'subject' seems to be used for the person who plays the active part in the relationship – the agent. The word is more obviously used in this sense in the parallel passage on p. 114 and elsewhere below.]

2 [See footnote 1 above.]

3 [*Footnote added* 1924:] In later works (cf. 'The Economic Problem of Masochism', 1924*c*) relating to problems of the drives I have expressed an opposite view. [*RSE*, **19**, 151 ff.]

subject's self *without* an attitude of passivity towards another person: the change has only got as far as stage (*b*). The desire to torture has turned into self-torture and self-punishment, not into masochism. The active voice is changed, not into the passive, but into the reflexive, middle voice.[1]

Our view of sadism is further prejudiced by the circumstance that this drive, side by side with its general aim (or perhaps, rather, within it), seems to strive towards the accomplishment of a quite special aim – not only to humiliate and master, but, in addition, to inflict pains. Psychoanalysis would appear to show that the infliction of pain plays no part among the original purposive actions of the drive. A sadistic child takes no account of whether or not he inflicts pains, nor does he intend to do so. But when once the transformation into masochism has taken place, the pains are very well fitted to provide a passive masochistic aim; for we have every reason to believe that sensations of pain, like other unpleasurable sensations, trench upon sexual excitation [*Sexualerregung*]^{T} and *Regung*
produce a pleasurable condition, for the sake of which the subject will even willingly experience the unpleasure of pain.[2] When once feeling pains has become a masochistic aim, the sadistic aim of *causing* pains can arise also, retrogressively; for while these pains are being inflicted on [129]
other people, they are enjoyed masochistically by the subject through his identification of himself with the suffering object. In both cases, of course, it is not the pain itself which is enjoyed, but the accompanying sexual excitation – so that this can be done especially conveniently from the sadistic position. The enjoyment of pain would thus be an aim which was originally masochistic, but which can only become a drive aim in someone who was originally sadistic.

For the sake of completeness I may add that feelings of pity cannot be described as a result of a transformation of drive occurring in sadism, but necessitate the notion of a *reaction-formation* [*Reaktionsbildung*]^{T} *Bildung*
against that drive. (For the difference, see later.)[3]

1 [The allusion here is to the voices of the Greek verb.]

2 [See a passage near the end of the second of the *Three Essays* (1905*d*), *RSE*, **7**, 180].

3 [It is not clear to what passage this is intended to refer, unless, again, it was included in a missing paper on sublimation. There is in fact some discussion of the subject in 'Thoughts for the Times on War and Death' (1915*b*), p. 281 below. But this cannot have been what Freud had in mind, for it was originally published in a different volume. In a footnote added in 1915 (the year in which the present paper was written) to the *Three Essays* (1905*d*), Freud insists that sublimation and reaction-formation are to be regarded as distinct processes (*RSE*, **7**, 159 *n*. 1). – The German word for 'pity' is '*Mitleid*', literally 'suffering with', 'compassion'. Another view of the origin of the feeling is expressed in the 'Wolf Man' analysis (1918*b*), ibid., **17**, 79, which was actually written, in all probability, at the end of 1914, a few months earlier than the present paper.]

Rather different and simpler findings are afforded by the investigation of another pair of opposites – the drives whose respective aim is to look and to display oneself (scopophilia [*Voyeur*] and exhibitionism, in the language of the perversions). Here again we may postulate the same stages as in the previous instance: (*a*) Looking as an *activity* directed towards an extraneous object. (*b*) Giving up of the object and turning of the scopophilic drive [*Schautriebes*] towards a part of the subject's own body; with this, transformation to passivity and setting up of a new aim – that of being looked at. (*c*) Introduction of a new subject[1] to whom one displays oneself in order to be looked at by him. Here, too, it can hardly be doubted that the active aim appears before the passive, that looking precedes being looked at. But there is an important divergence from what happens in the case of sadism, in that we can recognize in the case
[130] of the scopophilic drive a yet earlier stage than that described as (*a*). For the beginning of its activity the scopophilic drive is auto-erotic: it has indeed an object, but that object is part of the subject's own body. It is only later that the drive is led, by a process of comparison, to exchange this object for an analogous part of someone else's body – stage (*a*). This preliminary stage is interesting because it is the source of *both* the situations represented in the resulting pair of opposites, the one or the other according to which element in the original situation is changed. The following might serve as a diagrammatic picture of the scopophilic drive:

(α) Oneself looking at a sexual organ	=	A sexual organ being looked at by oneself
(β) Oneself looking at an extraneous object (active scopophilia)		(γ) An object which is oneself or part of oneself being looked at by an extraneous person (exhibitionism)

A preliminary stage of this kind is absent in sadism, which from the outset is directed upon an extraneous object, although it might not be altogether unreasonable to construct such a stage out of the child's efforts to gain control over his own limbs.[2]

With regard to both the drives which we have just taken as examples, it should be remarked that their transformation by a reversal from activity to passivity and by a turning round upon the subject never in fact

1 [I.e. agent; see footnote 1, p. 112 above.]

2 [*Footnote added* 1924:] Cf. footnote 3, p. 112.

involves the whole quota of the drive impulse. The earlier active direction of the drive persists to some degree side by side with its later passive direction, even when the process of its transformation has been very extensive. The only correct statement to make about the scopophilic drive would be that all the stages of its development, its auto-erotic, preliminary stage as well as its final active or passive form, coexist alongside one another; and the truth of this becomes obvious if we base our opinion, not on the actions to which the drive leads, but on the mechanism of its satisfaction. Perhaps, however, it is permissible to look at the matter and represent it in yet another way. We can divide the life of each [131]
drive into a series of separate successive waves, each of which is homogeneous during whatever period of time it may last, and whose relation to one another is comparable to that of successive eruptions of lava. We can then perhaps picture the first, original eruption of the drive as proceeding in an unchanged form and undergoing no development at all. The next wave would be modified from the outset – being turned, for instance, from active to passive – and would then, with this new characteristic, be added to the earlier wave, and so on. If we were then to take a survey of the drive impulse from its beginning up to a given point, the succession of waves which we have described would inevitably present the picture of a definite development of the drive.

The fact that, at this[1] later period of development of a drive impulse, its (passive) opposite may be observed alongside of it deserves to be marked by the very apt term introduced by Bleuler – 'ambivalence'.[2]

This reference to the developmental history of drives and the permanence of their intermediate stages should make the development of drives fairly intelligible to us. Experience shows that the amount of demonstrable ambivalence varies greatly between individuals, groups and races. Marked drive ambivalence in a human being living at the present day may be regarded as an archaic inheritance, for we have reason to suppose that the part played in the life of the drives by the active impulses in their

1 [*'jener'*. In the first edition only, '*jeder*', 'every'.]

2 [The term 'ambivalence', coined by Bleuler (1910*b*, and 1911, 43 and 305), seems not to have been used by him in this sense. He distinguished three kinds of ambivalence: (1) emotional, i.e. oscillation between love and hate, (2) voluntary, i.e. inability to decide on an action, and (3) intellectual, i.e. belief in contradictory propositions. Freud generally uses the term in the first of these senses. See, for instance, the first occasion on which he seems to have adopted it, near the end of his paper on 'The Dynamics of Transference' (1912*b*), *RSE*, **12**, 99, and later in the present paper (pp. 117 and 122 below). The passage in the text is one of the few in which he has applied the term to activity and passivity. For another instance of this exceptional use see a passage in Section III of the 'Wolf Man' case history (1918*b*), *RSE*, **17**, 24.]

unmodified form was greater in primaeval times than it is on an average today.[1]

[132] We have become accustomed to call the early phase of the development of the ego, during which its sexual drives find auto-erotic satisfaction, 'narcissism', without at once entering on any discussion of the relation between auto-erotism and narcissism. It follows that the preliminary stage of the scopophilic drive, in which the subject's own body is the object of the scopophilia, must be classed under narcissism, and that we must describe it as a narcissistic formation. The active scopophilic drive develops from this, by leaving narcissism behind. The passive scopophilic drive, on the contrary, holds fast to the narcissistic object. Similarly, the transformation of sadism into masochism implies a return to the narcissistic object. And in both these cases [i.e. in passive scopophilia and masochism] the narcissistic *subject* is, through identification, replaced with another, extraneous ego. If we take into account our constructed preliminary narcissistic stage of sadism, we shall be approaching a more general realization – namely, that the drive vicissitudes which consist in the drive's being turned round upon the subject's own ego and undergoing reversal from activity to passivity are dependent on the narcissistic organization of the ego and bear the stamp of that phase. They perhaps correspond to the attempts at defence which at higher stages of the development of the ego are effected by other means. [See above, p. 111.]

At this point we may call to mind that so far we have considered only two pairs of opposite drives: sadism–masochism and scopophilia–exhibitionism. These are the best-known sexual drives that appear in an ambivalent manner. The other components of the later sexual function are not yet sufficiently accessible to analysis for us to be able to discuss them in a similar way. In general we can assert of them that their activities are *auto-erotic*; that is to say, their object is negligible in comparison with the organ which is their source, and as a rule coincides with that organ. The object of the scopophilic drive, however, though it too is in the first instance a part of the subject's own body, is not the eye itself; and in sadism the organic source, which is probably the muscular apparatus with its capacity for action, points unequivocally at an object other than itself, even though that object is part of the subject's own body. In the auto-erotic drives, the part played by the organic source is so decisive that, according to

1 [See *Totem and Taboo* (1912–13*a*), ibid., **13**, 67 f.]

a plausible suggestion of Federn (1913) and Jekels (1913*b*), the form and function of the organ determine the activity or passivity of the drive aim. [133]

The change of the *content* [cf. p. 112 above] of a drive into its opposite is observed in a single instance only – the *transformation of love into hate*.[1] Since it is particularly common to find both these directed simultaneously towards the same object, their coexistence furnishes the most important example of ambivalence of feeling. [See p. 115 *n*. 2.]

The case of love and hate acquires a special interest from the circumstance that it refuses to be fitted into our scheme of the drives. It is impossible to doubt that there is the most intimate relation between these two opposite feelings and sexual life, but we are naturally unwilling to think of love as being some kind of special component drive of sexuality in the same way as the others we have been discussing. We should prefer to regard loving as the expression of the *whole* sexual current of feeling; but this idea does not clear up our difficulties, and we cannot see what meaning to attach to an opposite content of this current.

Loving admits not merely of one, but of three opposites. In addition to the antithesis 'loving–hating', there is the other one of 'loving–being loved'; and, in addition to these, loving and hating taken together are the opposite of the condition of unconcern or indifference. The second of these three antitheses, loving–being loved, corresponds exactly to the transformation from activity to passivity and may be traced to an underlying situation in the same way as in the case of the scopophilic drive. This situation is that of *loving oneself*, which we regard as the characteristic feature of narcissism. Then, according as the object or the subject is replaced with an extraneous one, what results is the active aim of loving or the passive one of being loved – the latter remaining near to narcissism.

Perhaps we shall come to a better understanding of the several opposites of loving if we reflect that our mental life as a whole is governed by *three polarities*, the antitheses

Subject (ego)–Object (external world),
Pleasure–Unpleasure, and
Active–Passive.

The antithesis ego–non-ego (external), i.e. subject–object, is, as we have [134]

1 [In the German editions previous to 1924 this reads 'the transformation of *love and hate*'.]

already said [p. 105 above], thrust upon the individual organism at an early stage, by the experience that it can silence *external* stimuli by means of muscular action but is defenceless against *drive* stimuli. This antithesis remains, above all, sovereign in our intellectual activity and creates for research the basic situation which no efforts can alter. The polarity of pleasure–unpleasure is attached to a scale of feelings, whose paramount importance in determining our actions (our will) has already been emphasized [p. 106]. The antithesis active–passive must not be confused with the antithesis ego-subject–external world-object. The relation of the ego to the external world is passive insofar as it receives stimuli from it and active when it reacts to these. It is forced by its drives into a quite special degree of activity towards the external world, so that we might bring out the essential point if we say that the ego-subject is passive in respect of external stimuli but active through its own drives. The antithesis active–passive coalesces later with the antithesis masculine–feminine, which, until this has taken place, has no psychological meaning. The coupling of activity with masculinity and of passivity with femininity meets us, indeed, as a biological fact; but it is by no means so invariably complete and exclusive as we are inclined to assume.[1]

The three polarities of the mind are connected with one another in various highly significant ways. There is a primal psychical situation in which two of them coincide. Originally, at the very beginning of mental life, the ego is cathected with drives [*triebbesetzt*][T] and is to some extent capable of satisfying them on itself. We call this condition 'narcissism' and this way of obtaining satisfaction 'auto-erotic'.[2] At this time the

Besetzung

1 [This question is discussed at much greater length in a footnote added in 1915 (the year in which the present paper was written) to the third of Freud's *Three Essays* (1905*d*), *RSE*, 7, 194 *n*. 1. – See also p. 48 f. above.]

2 Some of the sexual drives are, as we know, capable of this auto-erotic satisfaction, and so are adapted to being the vehicle for the development under the dominance of the pleasure principle [from the original 'reality ego' into the 'pleasure ego'] which we are about to describe [in the next paragraphs of the text]. Those sexual drives which from the outset require an object, and the needs of the ego drives, which are never capable of auto-erotic satisfaction, naturally disturb this state [of primal narcissism] and so pave the way for an advance from it. Indeed, the primal narcissistic state would not be able to follow the development [that is to be described] if it were not for the fact that every individual passes through a period during which he is helpless and has to be looked after and during which his pressing needs are satisfied by an external agency and are thus prevented from becoming greater. – [This very condensed footnote might have been easier to understand if it had been placed two or three paragraphs further on. It may perhaps be expanded as follows. In his paper on the 'Two Principles of Mental Functioning' (1911*b*) Freud had introduced the idea of the transformation of an early 'pleasure ego' into a 'reality ego'. In the passage which follows in the text above, he argues that there is in fact a still earlier *original* 'reality ego'. This original 'reality ego', instead of proceeding directly into the *final* 'reality ego', is replaced, under the dominating influence of the pleasure principle, by a 'pleasure ego'. The footnote enumerates those factors, on the one hand, which would favour this latter turn of events, and those factors, on the other hand, which would work against it. The existence of auto-erotic

external world is not cathected with interest (in a general sense) and is indifferent for purposes of satisfaction. During this period, therefore, the ego-subject coincides with what is pleasurable and the external world with what is indifferent (or possibly unpleasurable, as being a source of stimulation). If for the moment we define loving as the relation of the ego to its sources of pleasure, the situation in which the ego loves itself only and is indifferent to the external world illustrates the first of the opposites which we found to 'loving'.[1] [135]

Insofar as the ego is auto-erotic, it has no need of the external world, but, in consequence of experiences undergone by the drives to self-preservation, it acquires objects from that world, and, in spite of everything, it cannot avoid feeling internal drive stimuli for a time as unpleasurable. Under the dominance of the pleasure principle a further development now takes place in the ego. Insofar as the objects which are presented to it are sources of pleasure, it takes them into itself, 'introjects' them (to use Ferenczi's [1909] term[2]); and, on the other hand, it expels whatever within itself becomes a cause of unpleasure. (See below [pp. 163 and 198 f.], the mechanism of projection.) [136]

Thus the original 'reality ego', which distinguished internal and external by means of a sound objective criterion,[3] changes into a purified 'pleasure ego', which places the characteristic of pleasure above all others. For the pleasure ego the external world is divided into a part that is pleasurable, which it has incorporated into itself, and a remainder that is extraneous to it. It has separated off a part of its own self, which it projects into the external world and feels as hostile. After this new arrangement, the two polarities coincide once more: the ego-subject coincides with pleasure, and the external world with unpleasure (with what was earlier indifference).

libidinal drives would encourage the diversion to a 'pleasure ego', while the *non*-auto-erotic libidinal drives and the self-preservative drives would be likely instead to bring about a direct transition to the final adult 'reality ego'. This latter result would, he remarks, in fact come about if it were not that parental care of the helpless infant satisfies this second set of drives, artificially prolongs the primary state of narcissism, and so helps to make the establishment of the 'pleasure ego' possible.]

1 [On p. 117 above Freud enumerates the opposites of loving in the following order: (1) hating, (2) being loved and (3) indifference. In the present passage, and below on pp. 120 and 123, he adopts a different order: (1) indifference, (2) hating and (3) being loved. It seems probable that in this second arrangement he gives indifference the first place as being the first to appear in the course of development.]

2 [This seems to be the first occasion on which Freud himself used the term. Cf. the footnote on p. 215 below.]

3 [See above p. 105 and footnote 2. The 'reality ego' and the 'pleasure ego' had already been introduced in the paper on the two principles of mental functioning (1911*b*), *RSE*, **12**, 219.]

When, during the stage of primary narcissism, the object makes its appearance, the second opposite to loving, namely hating, also attains its development.[1]

As we have seen, the object is brought to the ego from the external world in the first instance by the drives to self-preservation; and it cannot be denied that hating, too, originally characterized the relation of the ego to the alien external world with the stimuli it introduces. Indifference falls into place as a special case of hate or dislike, after having first appeared as their forerunner. At the very beginning, it seems, the external world, objects, and what is hated are identical. If later on an object turns out to be a source of pleasure, it is loved, but it is also incorporated into the ego; so that for the purified pleasure ego once again objects coincide with what is extraneous and hated.

Now, however, we may note that just as the pair of opposites love–indifference reflects the polarity ego–external world, so the second antithesis love–hate[2] reproduces the polarity pleasure–unpleasure, [137] which is linked to the first polarity. When the purely narcissistic stage has given place to the object stage, pleasure and unpleasure signify relations of the ego to the object. If the object becomes a source of pleasurable feelings, a motor urge is set up which seeks to bring the object closer to the ego and to incorporate it into the ego. We then speak of the 'attraction' exercised by the pleasure-giving object, and say that we 'love' that object. Conversely, if the object is a source of unpleasurable feelings, there is an urge which endeavours to increase the distance between the object and the ego and to repeat in relation to the object the original attempt at flight from the external world with its emission of stimuli. We feel the 'repulsion' of the object, and hate it; this hate can afterwards be intensified to the point of an aggressive inclination against the object – an intention to destroy it.

We might at a pinch say of a drive that it 'loves' the objects towards which it strives for purposes of satisfaction; but to say that a drive 'hates' an object strikes us as odd. Thus we become aware that the attitudes[3] of love and hate cannot be made use of for the relations of *drives* to their objects, but are reserved for the relations of the *total ego* to objects. But if we consider linguistic usage, which is certainly not without significance, we shall see that there is a further limitation to the meaning of

1 [See footnote 1, p. 119 above.]

2 [See footnote 1, p. 119 above.]

3 [German '*Beziehungen*', literally 'relations'. In the first edition this word is printed '*Bezeichnungen*', 'descriptions' or 'terms' – which seems to make better sense. The word 'relations' in the later part of the sentence stands for '*Relationen*' in the German text.]

love and hate. We do not say of objects which serve the interests of self-preservation that we *love* them; we emphasize the fact that we *need* them, and perhaps express an additional, different kind of relation to them by using words that denote a much reduced degree of love – such as, for example, 'being fond of', 'liking' or 'finding agreeable'.

Thus the words 'to love' move further and further into the sphere of the pure pleasure relation of the ego to the object and finally become fixed to sexual objects in the narrower sense and to those which satisfy the needs of sublimated sexual drives. The distinction between the ego drives and the sexual drives which we have imposed upon our psychology is thus seen to be in conformity with the spirit of our language. The fact that we are not in the habit of saying of a single sexual drive that it loves its object, but regard the relation of the ego to its sexual object as [138]
the most appropriate case in which to employ the word 'love' – this fact teaches us that the word can only begin to be applied in this relation after there has been a synthesis of all the component drives of sexuality under the primacy of the genitals and in the service of the reproductive function.

It is noteworthy that in the use of the word 'hate' no such intimate connection with sexual pleasure and the sexual function appears. The relation of *unpleasure* seems to be the sole decisive one. The ego hates, abhors and pursues with intent to destroy all objects which are a source of unpleasurable feeling for it, without taking into account whether they mean a frustration [*Versagung*][T] of sexual satisfaction or of the satisfaction of self-preservative needs. Indeed, it may be asserted that the true prototypes of the relation of hate are derived not from sexual life, but from the ego's struggle to preserve and maintain itself.

So we see that love and hate, which present themselves to us as complete opposites in their content, do not after all stand in any simple relation to each other. They did not arise from the cleavage of any originally common entity, but sprang from different sources, and had each its own development before the influence of the pleasure–unpleasure relation made them into opposites.

It now remains for us to put together what we know of the genesis of love and hate. Love is derived from the capacity of the ego to satisfy some of its drive impulses auto-erotically by obtaining organ pleasure. It is originally narcissistic, then passes over on to objects, which have been incorporated into the extended ego, and expresses the motor efforts of the ego towards these objects as sources of pleasure. It becomes intimately linked with the activity of the later sexual

drives and, when these have been completely synthesized, coincides with the sexual impulsion as a whole. Preliminary stages of love emerge as provisional sexual aims while the sexual drives are passing through their complicated development. As the first of these aims we recognize the phase of *incorporating or devouring* – a type of love which is consistent with abolishing the object's separate existence and which may therefore be described as ambivalent.[1] At the higher stage
[139] of the pregenital sadistic-anal organization,[2] the striving for the object appears in the form of an urge for mastery, to which injury or annihilation of the object is a matter of indifference. Love in this form and at this preliminary stage is hardly to be distinguished from hate in its attitude towards the object. Not until the genital organization is established does love become the opposite of hate.

Hate, as a relation to objects, is older than love. It derives from the narcissistic ego's primordial repudiation of the external world with its outpouring of stimuli. As an expression of the reaction of unpleasure evoked by objects, it always remains in an intimate relation with the self-preservative drives; so that sexual and ego drives can readily develop an antithesis which repeats that of love and hate. When the ego drives dominate the sexual function, as is the case at the stage of the sadistic-anal organization, they impart the qualities of hate to the drive aim as well.

The history of the origins and relations of love makes us understand how it is that love so frequently manifests itself as 'ambivalent' – i.e. as accompanied by impulses of hate against the same object.[3] The hate which is admixed with the love is in part derived from the preliminary stages of loving which have not been wholly surmounted; it is also in part based on reactions of repudiation by the ego drives, which, in view of the frequent conflicts between the interests of the ego and those of love, can find grounds in real and contemporary motives. In both cases, therefore, the admixed hate has as its source the self-preservative drives. If a love relation with a given object is broken off, hate not infrequently emerges in its place, so that we get the impression of a transformation of love into hate. This account of what happens leads on to the view that the hate, which has its real motives, is here reinforced by a regression of the love to the sadistic preliminary stage; so

1 [Freud's first published account of the oral stage was given in a paragraph added to the third (1915) edition of his *Three Essays*, *RSE*, **7**, 175. The Preface to that edition is dated 'October, 1914' – some months before the present paper was written. See also below, p. 223 ff.]

2 [See 'The Disposition to Obsessional Neurosis' (1913*i*), *RSE*, **12**, 313 ff.]

3 [See footnote 2, p. 115 above.]

that the hate acquires an erotic character and the continuity of a love relation is ensured.

The third antithesis of loving, the transformation of loving into being loved,[1] corresponds to the operation of the polarity of activity and passivity, and is to be judged in the same way as the cases of scopophilia and sadism.[2] [140]

We may sum up by saying that the essential feature in the vicissitudes undergone by drives lies in *the subjection of the drive impulses to the influences of the three great polarities that dominate mental life*. Of these three polarities we might describe that of activity–passivity as the *biological*, that of ego–external world as the *real*, and finally that of pleasure–unpleasure as the *economic* polarity.

The drive vicissitude of *repression* will form the subject of an inquiry which follows [in the next paper].

1 [See footnote 1, p. 119 above.]

2 [The relation between love and hate was further discussed by Freud, in the light of his hypothesis of a death drive, in Chapter IV of *The Ego and the Id* (1923*b*), *RSE*, **19**, 35 ff.]

The present translation is a revised and corrected reprint of the *SE* version.

In his 'History of the Psychoanalytic Movement' (1914*d*), Freud declared that 'the theory of repression is the cornerstone on which the whole structure of psychoanalysis rests' (p. 13 above); and in the present essay, together with Section IV of the paper on 'The Unconscious' which follows it (p. 159 ff.), he gave his most elaborate formulation of that theory.

The concept of repression goes back historically to the very beginnings of psychoanalysis. The first published reference to it was in Breuer & Freud's 'Preliminary Communication' of 1893 (*RSE*, **2**, 9). The term '*Verdrängung*' had been used by the early nineteenth-century psychologist Herbart (1824) and may possibly have come to Freud's knowledge through his teacher Meynert, who had been an admirer of Herbart.[1] But, as Freud himself insisted in the passage of the 'History' already quoted (p. 12 above), 'the theory of repression quite certainly came to me independently of any other source'. 'It was a novelty', he wrote in his *Autobiographical Study* (1925*d*), [144]

1 See below, p. 144. A full discussion of this can be found in the first volume of Ernest Jones's biography (1953, 407 ff.). For a discussion of the English translation of the term, see *RSE*, **24**, 90–1.

'and nothing like it had ever before been recognized in mental life.' (*RSE*, **20**, 26.) There are several accounts in Freud's writings of how the discovery came about: for instance, in the *Studies on Hysteria* (1895*d*), ibid., **2**, 238–40, and again in the 'History', p. 13 above. All these accounts are alike in emphasizing the fact that the concept of repression was inevitably suggested by the clinical phenomenon of resistance, which in turn was brought to light by a technical innovation – namely, the abandonment of hypnosis in the cathartic treatment of hysteria.

It will be noticed that in the account given in the *Studies* the term actually used to describe the process is not 'repression' but 'defence'. At this early period the two terms were used by Freud indifferently, almost as equivalents, though 'defence' was perhaps the commoner. Soon, however, as he remarked in his paper on sexuality in the neuroses (1906*a*), *RSE*, **7**, 286, 'repression' began to be used quite generally in place of 'defence'. Thus, for instance, in the 'Rat Man' case history (1909*d*) Freud discussed the mechanism of 'repression' in obsessional neurosis – i.e. the displacement of the emotional cathexis from the objectionable idea, as contrasted with the complete expulsion of the idea from consciousness in hysteria – and spoke of 'two kinds of repression' (ibid., **10**, 150). It is, indeed, in this wider sense that the term is used in the present paper, as is shown by the discussion towards the end of it on the different mechanisms of repression in the various forms of psychoneurosis. It seems pretty clear, however, that the form of repression which Freud had chiefly in mind here was that which occurs in hysteria; and much later on, in Chapter XI, Section A (*c*), of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 144, he proposed to restrict the term 'repression' to this one particular mechanism and to revive 'defence' as 'a general designation for all the techniques which the ego makes use of in conflicts which may lead to a neurosis'. The importance of making this distinction was later illustrated by him in Section V of 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**.

The special problem of the nature of the driving force which puts repression into operation was one which was a constant source of concern to Freud, though it is scarcely touched on in the present paper. In particular, there was the question of the
[145] relation between repression and sex, and to this Freud in his early days gave fluctuating replies, as may be seen at many points in the Fliess correspondence (1950*a*). Subsequently, however, he firmly rejected any attempt at 'sexualizing' repression. A full discussion of this question (with particular reference to the views of Adler) can be found in the last section of '"A Child is Being Beaten"' (1919*e*), ibid., **17**, 194 ff. Later still, in *Inhibitions, Symptoms and Anxiety* (1926*d*), especially in Chapter IV, ibid., **20**, and in the earlier part of Lecture XXXII of the *New Introductory Lectures* (1933*a*), ibid., **22**, he threw fresh light on the subject by arguing that anxiety was not, as he had previously held and as he states below, for instance on pp. 135 and 137, a *consequence* of repression but was one of the chief driving forces leading to it.[1]

1 The distinction between repression and the 'disavowal' or 'denial' ('*Verleugnung*') by the ego of external reality or some part of it was first discussed by Freud at length in his paper on 'Fetishism' (1927*e*), *RSE*, **21**. See below, p. 196.

REPRESSION

[146]
Trieb, Regung

One of the vicissitudes [*Schicksal*]^{T} a drive impulse [*Triebregung*]^{T} may undergo is to meet with resistances which seek to make it inoperative [*unwirksam*]^{t}. Under certain conditions, which we shall presently investigate more closely, the impulse then passes into the state of 'repression' [*Verdrängung*]^{T}. If what was in question was the operation of an external stimulus, the appropriate method to adopt would obviously be flight; with a drive, flight is of no avail, for the ego [*Ich*]^{T} cannot escape from itself. At some later period, rejection based on judgement (*condemnation*) will be found to be a good method to adopt against a drive impulse. Repression is a preliminary stage of condemnation, something between flight and condemnation; it is a concept which could not have been formulated before the time of psychoanalytic studies.

It is not easy in theory to deduce the possibility of such a thing as repression. Why should a drive impulse undergo a vicissitude like this? A necessary condition of its happening must clearly be that the drive's attainment of its aim should produce unpleasure [*Unlust*]^{T} instead of pleasure [*Lust*]. But we cannot well imagine such a contingency. There are no such drives: satisfaction of a drive is always pleasurable. We should have to assume certain peculiar circumstances, some sort of process by which the pleasure of satisfaction is changed into unpleasure.

In order the better to delimit repression, let us discuss some other drive situations. It may happen that an external stimulus becomes internalized – for example, by eating into and destroying some bodily organ – so that a new source of constant excitation and increase of tension arises. The stimulus thereby acquires a far-reaching similarity to a drive. We know that a case of this sort is experienced by us as *pain*. The aim of this pseudo-drive, however, is simply the cessation of the change in the organ and of the unpleasure accompanying it. There is no other direct pleasure to be attained by cessation of pain. Further, pain is imperative; the only things to which it can yield are removal by some toxic agent or the influence of mental [*psychische*] distraction.

[147] The case of pain is too obscure to give us any help in our purpose.[1] Let us take the case in which a drive stimulus [*Triebreiz*] such as hunger remains unsatisfied. It then becomes imperative and can be allayed by nothing but the action that satisfies it;[2] it keeps up a constant tension of need. Nothing in the nature of a repression seems in this case to come remotely into question.

Thus repression certainly does not arise in cases where the tension produced by lack of satisfaction of a drive impulse is raised to an unbearable degree. The methods of defence [*Abwehrmitteln*]^{T} which are open to the organism against that situation must be discussed in another connection.[3]

Abwehr

Let us rather confine ourselves to clinical experience, as we meet with it in psychoanalytic practice. We then learn that the satisfaction of a drive which is under repression would be quite possible, and further, that in every instance such a satisfaction would be pleasurable in itself; but it would be irreconcilable with other claims and intentions. It would, therefore, cause pleasure in one place and unpleasure in another. It has consequently become a condition for repression that the motive force of unpleasure [*Unlustmotiv*]^{T} shall have acquired more strength [*Macht*]^{T} than the pleasure obtained from satisfaction. Psychoanalytic observation of the transference neuroses [*Übertragungsneurosen*]^{T}, moreover, leads us to conclude that repression is not a defensive mechanism which is present from the very beginning, and that it cannot arise until a sharp cleavage has occurred between conscious and unconscious mental activity [*Seelentätigkeit*]^{T} – that *the essence of repression lies simply in turning something away, and keeping it at a distance, from the conscious*.[4] This view of repression would be made more complete by assuming that, before the mental organization reaches this stage, the task of fending off [*Abwehr*] drive impulses is dealt with by the other vicissitudes which drives may undergo – e.g. reversal into the opposite or turning round upon the subject's own self [cf. pp. 111–12 above].

Motiv

Übertragung

Seele

[148] It seems to us now that, in view of the very great extent to which repression and what is unconscious are correlated, we must defer probing more deeply into the nature of repression until we have learnt more about the structure [*Aufbau*]^{T} of the succession of psychical agencies

1 [Pain and the organism's method of dealing with it are discussed in Chapter IV of *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 29 f. The subject is already raised in Part I, Section 6, of the 'Project' (1950*a* [1895]), ibid., **1**, 331–2, and in *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 150–1.]

2 [In the 'Project' (1950*a* [1895]), Part I, Section 1, ibid., **1**, 321, this is termed the 'specific action'.]

3 [It is not clear what 'other connection' Freud had in mind.]

4 [A modification of this formula can be found below on p. 179.]

and about the differentiation between what is unconscious and conscious. [See the following paper, p. 159 ff.] Till then, all we can do is to put together in a purely descriptive fashion a few characteristics of repression that have been observed clinically, even though we run the risk of having to repeat unchanged much that has been said elsewhere.

We have reason to assume that there is a *primal repression*, a first phase of repression, which consists in the psychical (ideational [*Vorstellungs-*]^{T}) representative [*Repräsentanz*]^{I} of the drive being denied entrance into the conscious. With this a *fixation* [*Fixierung*]^{T} is established; the representative in question persists unaltered from then onwards and the drive remains attached [*gebunden*] to it. This is due to the properties of unconscious processes of which we shall speak later [p. 165 f. below].

The second stage of repression, *repression proper*, affects mental derivatives of the repressed representative, or such trains of thought as, originating elsewhere, have come into associative connection with it. On account of this association, these ideas experience the same fate as what was primally repressed. Repression proper, therefore, is actually an after-pressure.[2] Moreover, it is a mistake to emphasize only the repulsion which operates from the direction of the conscious upon what is to be repressed; quite as important is the attraction exercised by what was primally repressed upon everything with which it can establish a connection. Probably the trend towards repression would fail in its purpose if these two forces [*Kräfte*]^{T} did not cooperate, if there were not something previously repressed ready to receive what is repelled by the conscious.[3]

Under the influence of the study of the psychoneuroses, which brings [149]
before us the important effects of repression, we are inclined to overvalue their psychological bearing and to forget too readily that repression does not hinder the drive representative from continuing to exist in the unconscious, from organizing itself further, putting out derivatives and establishing connections. Repression, in fact, interferes only with the relation of the drive representative to *one* psychical system, namely, to that of the conscious.

1 [See the Editors' Note to the previous paper, p. 99 ff.]

2 ['*Nachdrängen*.' Freud uses the same term in his account of the process in the Schreber analysis (see footnote 3 below), and also in his paper on 'The Unconscious' (see below, pp. 159 and 160). But, on alluding to the point more than twenty years later in the third section of 'Analysis Terminable and Interminable' (1937*c*), he uses the word '*Nachverdrängung*' ('after-repression').]

3 [The account of the two stages of repression given in the last two paragraphs had been anticipated by Freud four years earlier (though in a somewhat different form) in the third section of the Schreber analysis (1911*c*), *RSE*, **12**, and in a letter to Ferenczi of December 6, 1910 (Jones, 1955, 499). See also *RSE*, **5**, 489 *n*. 2, and ibid., **7**, 156 *n*. 1.]

Psychoanalysis is able to show us other things as well which are important for understanding the effects of repression in the psychoneuroses. It shows us, for instance, that the drive representative develops with less interference and more profusely if it is withdrawn by repression from conscious influence. It proliferates in the dark, as it were, and takes on extreme forms of expression, which when they
Übersetzung are translated [*übersetzt*][T] and presented to the neurotic are bound to not only seem alien to him, but frighten him by giving him the picture of an extraordinary and dangerous strength of drive. This deceptive
Hemmung strength of drive is the result of an uninhibited [*ungehemmten*][T] development in phantasy [*Phantasie*][T] and of the damming up consequent
Versagung on frustrated [*versagter*][T] satisfaction. The fact that this last result is bound up with repression points to the direction in which the true significance of repression has to be looked for.

Reverting once more, however, to the opposite aspect of repression, let us make it clear that it is not even correct to suppose that repression withholds from the conscious *all* the derivatives of what was primally repressed.[1] If these derivatives have become sufficiently far removed from the repressed representative, whether owing to the adoption of distortions or by reason of the number of intermediate links inserted, they have free access to the conscious. It is as though the resistance of the conscious against them was a function of their distance from what was originally repressed. In carrying out the technique of psychoanalysis, we continually require the patient to produce such derivatives of the repressed as, in consequence either of their
[150] remoteness or of their distortion, can pass the censorship of the conscious. Indeed, the associations [*Einfälle*][T] which we require him to give without being influenced by any conscious purposive idea and without any criticism, and from which we reconstitute a conscious translation of the repressed representative – these associations are nothing else than remote and distorted derivatives of this kind. During this process we observe that the patient can go on spinning a thread of such associations till he is brought up against some thought, the relation of which to what is repressed becomes so obvious that he is compelled to repeat his attempt at repression. Neurotic symptoms, too, must have fulfilled this same condition, for they are derivatives of

1 [What follows in this paragraph is discussed at greater length in Section VI of 'The Unconscious' (below, p. 167 ff.).]

the repressed, which has, by their means, finally won the access to consciousness which was previously denied to it.[1]

We can lay down no general rule as to what degree of distortion and remoteness is necessary before the resistance on the part of the conscious is removed. A delicate balancing is here taking place, the play of which is hidden from us; its mode of operation, however, enables us to infer that it is a question of calling a halt when the cathexis [*Besetzung*][T] of the unconscious reaches a certain intensity – an intensity beyond which the unconscious would break through to satisfaction. Repression acts, therefore, in a *highly individual* manner. Each single derivative of the repressed may have its own special vicissitude; a little more or a little less distortion alters the whole outcome. In this connection we can understand how it is that the objects to which men give most preference, their ideals, proceed from the same perceptions and experiences as the objects which they most abhor, and that they were originally only distinguished from one another through slight modifications. [Cf. p. 81 above.] Indeed, as we found in tracing the origin of the fetish,[2] it is possible for the original drive representative to be split in two, one part undergoing repression, while the remainder, precisely on account of this intimate connection, undergoes idealization.

The same result as follows from an increase or a decrease in the degree [151]
of distortion may also be achieved at the other end of the apparatus, so to speak, by a modification in the condition for the production of pleasure and unpleasure. Special techniques have been evolved, with the purpose of bringing about such changes in the play of mental forces that what would otherwise give rise to unpleasure may on this occasion result in pleasure; and, whenever a technical device of this sort comes into operation, the repression of a drive representative which would otherwise be repudiated is lifted. These techniques have till now only been studied in any detail in jokes.[3] As a rule the repression is only temporarily lifted and is promptly reinstated.

Observations like this, however, enable us to note some further characteristics of repression. Not only is it, as we have just shown, *individual* in its operation, but it is also exceedingly *mobile*. The process of

1 [In the German editions before 1924 the latter part of this sentence read: 'Welches sich . . . den ihm versagten Zugang vom Bewusstsein endlich erkämpft hat'. This was translated formerly 'which has finally . . . wrested from consciousness the right of way previously denied it'. In the German editions from 1924 onwards the word '*vom*' was corrected to '*zum*', thus altering the sense to that given in the text above.]

2 [Cf. Section 2 (A) of the first of Freud's *Three Essays* (1905*d*), *RSE*, **7**, 136–8 and footnotes.]

3 [See the second chapter on Freud's book on *Jokes* (1905*c*), ibid., **8**.]

repression is not to be regarded as an event which takes place *once*, the results of which are permanent, as when some living thing has been killed and from that time onwards is dead; repression demands a persistent expenditure of force, and if this were to cease the success of the repression would be jeopardized, so that a fresh act of repression would be necessary. We may suppose that the repressed exercises a continuous pressure in the direction of the conscious, so that this pressure must be balanced by an unceasing counter-pressure.[1] Thus the maintenance of a repression involves an uninterrupted expenditure of force, while its removal results in a saving from an economic point of view. The mobility of repression, incidentally, also finds expression in the psychical characteristics of the state of sleep, which alone renders possible the formation of dreams.[2] With a return to waking life the repressive cathexes which have been drawn in are once more sent out.

Finally, we must not forget that after all we have said very little about a drive impulse when we have established that it is repressed. Without prejudice to its repression, such an impulse may be in widely different states. It may be inactive, i.e. only very slightly cathected with mental energy; or it may be cathected in varying degrees, and so enabled to be
[152] active. True, its activation will not result in a direct lifting of the repression, but it will set in motion all the processes which end in a penetration by the impulse into consciousness along circuitous paths. With unrepressed derivatives of the unconscious the fate of a particular idea is often decided by the degree of its activity or cathexis. It is an everyday occurrence that such a derivative remains unrepressed so long as it represents only a small amount of energy, although its content would be calculated to give rise to a conflict with what is dominant in consciousness. The quantitative factor proves decisive for this conflict: as soon as the basically obnoxious idea exceeds a certain degree of strength, the conflict becomes a real one, and it is precisely this activation that leads to repression. So that, where repression is concerned, an increase of energic cathexis operates in the same sense as an approach to the unconscious, while a decrease of that cathexis operates in the same sense as remoteness from the unconscious or distortion. We see that the repressive trends may find a substitute for repression in a weakening of what is distasteful.

1 [This is discussed further on p. 159 f. below.]

2 [Cf. *The Interpretation of Dreams* (1900*a*), Chapter VII (C); *RSE*, **5**, 507–8. See also below, p. 200.]

In our discussion so far we have dealt with the repression of a drive representative, and by the latter we have understood an idea[1] or group of ideas which is cathected with a definite quota of psychical energy (libido or interest) coming from a drive. Clinical observation now obliges us to divide up what we have hitherto regarded as a single entity; for it shows us that besides the idea, some other element representing the drive has to be taken into account, and that this other element undergoes vicissitudes of repression which may be quite different from those undergone by the idea. For this other element of the psychical representative the term *quota of affect* has been generally adopted.[2] It corresponds to the drive insofar as the latter has become detached from the idea and finds expression, proportionate to its quantity, in processes which are sensed as affects. From this point on, in describing a case of repression, we shall have to follow up separately what, as the result of repression, becomes of the *idea*, and what becomes of the drive energy linked to it.

We should be glad to be able to say something general about the vicissitudes of both; and having taken our bearings a little we shall in fact be able to do so. The general vicissitude which overtakes the *idea* that represents the drive can hardly be anything else than that it should vanish from the conscious if it was previously conscious, or that it should be held back from consciousness if it was about to become conscious. The difference is not important; it amounts to much the same thing as the difference between my ordering an undesirable guest out of my drawing room (or out of my front hall), and my refusing, after recognizing him, to let him cross my threshold at all.[3] The *quantitative* factor of the drive representative has three possible vicissitudes, as we can see from a cursory survey of the observations made by psychoanalysis: either the drive is altogether suppressed, so that no trace of it is found, or it appears as an affect which is in some way or other qualitatively coloured, or it is changed into anxiety.[4] The two latter possibilities set us the task of taking into account, as a further drive vicissitude, the *transformation* into *affects*, and especially into *anxiety*, of the psychical energies of drives. [153]

1 ['*Vorstellung*.' See footnote 2, p. 154 below.]

2 ['*Affektbetrag*.' This term dates back to the Breuer period. Cf., for instance, Freud's paper (1894*a*), and the Editors' Appendix (*RSE*, **3**, 56 and 57 ff.).]

3 This simile, which is thus applicable to the process of repression, may also be extended to a characteristic of it which has been mentioned earlier: I have merely to add that I must set a permanent guard over the door which I have forbidden this guest to enter, since he would otherwise burst it open. (See above [p. 133 f.].) [The simile had been elaborated by Freud in the second of his *Five Lectures* (1910*a*), *RSE*, **11**, 25–7.]

4 [Freud's altered views on this last point were stated by him in *Inhibitions, Symptoms and Anxiety* (1926*d*), especially at the end of Chapter IV and in Chapter XI, Section A (*b*); ibid., **20**.]

We recall the fact that the motive and purpose of repression was nothing else than the avoidance of unpleasure. It follows that the vicissitude of the quota of affect belonging to the representative is far more important than the vicissitude of the idea, and this fact is decisive for our assessment of the process of repression. If a repression does not succeed in preventing feelings of unpleasure or anxiety from arising, we may say that it has failed, even though it may have achieved its purpose as far as the ideational portion is concerned. Repressions that have failed will of course have more claim on our interest than any that may have been successful; for the latter will for the most part escape our examination.

[154] We must now try to obtain some insight into the *mechanism* of the process of repression. In particular, we want to know whether there is a single mechanism only, or more than one, and whether perhaps each of the psychoneuroses is distinguished by a mechanism of repression peculiar to it. At the outset of this enquiry, however, we are met by complications. The mechanism of a repression becomes accessible to us only by our deducing that mechanism from the *outcome* of the repression. Confining our observations to the effect of repression on the ideational portion of the representative, we discover that as a rule it creates a *substitutive formation*. What is the mechanism by which such a substitute is formed? Or should we distinguish several mechanisms here as well? Further, we know that repression leaves *symptoms* behind it. May we then suppose that the forming of substitutes and the forming of symptoms coincide, and, if this is so on the whole, is the mechanism of forming symptoms the same as that of repression? The general probability would seem to be that the two are widely different, and that it is not the repression itself which produces substitutive formations and symptoms, but that these latter are indications of a *return of the repressed*[1] and owe their existence to quite other processes. It would also seem advisable to examine the mechanisms by which substitutes and symptoms are formed before considering the mechanisms of repression.

Obviously this is no subject for further speculation. The place of speculation must be taken by a careful analysis of the results of repression observable in the different neuroses. I must, however, suggest that we should postpone this task, too, until we have formed reliable conceptions of the relation of the conscious to the unconscious.[2] But, in

1 [The concept of a 'return of the repressed' is a very early one in Freud's writings. It appears already in Section II of his second paper on 'The Neuropsychoses of Defence' (1896*b*), as well as in the still earlier draft of that paper sent to Fliess on January 1, 1896 (1950*a*, Draft K).]

2 [Freud takes up the task in Section IV of his paper on 'The Unconscious', below, p. 161 ff.]

order that the present discussion may not be entirely unfruitful, I will say in advance that (1) the mechanism of repression does not in fact coincide with the mechanism or mechanisms of forming substitutes, (2) there are a great many different mechanisms of forming substitutes and (3) the mechanisms of repression have at least this one thing in common: a [155] *withdrawal of the cathexis of energy* (or of *libido*, where we are dealing with sexual drives).

Further, restricting myself to the three best-known forms of psychoneurosis, I will show by means of some examples how the concepts here introduced find application to the study of repression.

From the field of *anxiety hysteria* I will choose a well-analysed example of an animal phobia.[1] The drive impulse subjected to repression here is a libidinal attitude towards the father, coupled with fear of him. After repression, this impulse vanishes out of consciousness: the father does not appear in it as an object of libido. As a substitute for him we find in a corresponding place some animal which is more or less fitted to be an object of anxiety. The formation of the substitute for the ideational portion [of the drive representative] has come about by *displacement* [*Verschiebung*][T] along a chain of connections which is determined in a particular way. The quantitative portion has not vanished, but has been transformed into anxiety. The result is fear of a wolf, instead of a demand for love from the father. The categories here employed are, of course, not enough to supply an adequate explanation of even the simplest case of psychoneurosis: there are always other considerations to be taken into account. A repression such as occurs in an animal phobia must be described as radically unsuccessful. All that it has done is to remove and replace the idea; it has failed altogether in sparing unpleasure. And for this reason, too, the work of the neurosis does not cease. It proceeds to a second phase, in order to attain its immediate and more important purpose. What follows is an attempt at flight – the formation of the *phobia proper*, of a number of avoidances which are intended to prevent a release of the anxiety. More specialized investigation enables us to understand the mechanism by which the phobia achieves its aim. [See p. 161 ff. below.]

We are obliged to take quite another view of the process of repression when we consider the picture of a true *conversion hysteria*. Here the salient point is that it is possible to bring about a total disappearance of the quota of affect. When this is so, the patient displays towards his

1 [This is, of course, a reference to the case history of the 'Wolf Man' (1918*b*), *RSE*, **17**, which, though it was not published till three years after the present paper, had already been completed in essentials.]

[156] symptoms what Charcot called '*la belle indifférence des hystériques*'.[1] In other cases this suppression is not so completely successful: some distressing sensations may attach to the symptoms themselves, or it may prove impossible to prevent some release of anxiety, which in turn sets to work the mechanism of forming a phobia. The ideational content of the drive representative is completely withdrawn from consciousness; as a substitute – and at the same time as a symptom – we have an over-strong innervation (in typical cases, a somatic one), sometimes of a sensory, sometimes of a motor character, either as an excitation or an inhibition. The over-innervated area proves on a closer view to be a part of the repressed drive representative itself – a part which, as though by a process of *condensation* [*Verdichtung*][T], has drawn the whole cathexis on to itself. These remarks do not of course bring to light the whole mechanism of a conversion hysteria; in particular the factor of *regression*, which will be considered in another connection, has also to be taken into account.[2] Insofar as repression in [conversion] hysteria is made possible only by the extensive formation of substitutes, it may be judged to be entirely unsuccessful; as regards dealing with the quota of affect, however, which is the true task of repression, it generally signifies a total success. In conversion hysteria the process of repression is completed with the formation of the symptom and does not, as in anxiety hysteria, need to continue to a second phase – or rather, strictly speaking, to continue endlessly.

A totally different picture of repression is shown, once more, in the third disorder which we shall consider for the purposes of our illustration – in *obsessional neurosis*. Here we are at first in doubt what it is that we have to regard as the drive representative that is subjected to repression – whether it is a libidinal or a hostile trend. This uncertainty arises because obsessional neurosis has as its basis a regression owing to which a sadistic trend has been substituted for an affectionate one. It is this hostile impulsion [*Impuls*] against someone who is loved which is subjected to repression. The effect at an early stage of the work of repression is quite different from what it is at a later one. At first the repression is completely successful; the ideational
[157] content is rejected and the affect made to disappear. As a substitutive formation there arises an alteration of the ego in the shape of an increased conscientiousness, and this can hardly be called a symptom.

1 [Freud had already quoted this in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 120.]

2 [This is perhaps a reference to the missing metapsychological paper on conversion hysteria. See Editors' Introduction, p. 93 ff. above.]

Here, substitute and symptom do not coincide. From this we learn something, too, about the mechanism of repression. In this instance, as in all others, repression has brought about a withdrawal of libido; but here it has made use of *reaction-formation* for this purpose, by intensifying an opposite. Thus in this case the formation of a substitute has the same mechanism as repression and at bottom coincides with it, while chronologically, as well as conceptually, it is distinct from the formation of a symptom. It is very probable that the whole process is made possible by the ambivalent relationship into which the sadistic impulsion that has to be repressed has been introduced. But the repression, which was at first successful, does not hold firm; in the further course of things its failure becomes increasingly marked. The ambivalence which has enabled repression through reaction-formation to take place is also the point at which the repressed succeeds in returning. The vanished affect comes back in its transformed shape as social anxiety, moral anxiety and unlimited self-reproaches; the rejected idea is replaced with a *substitute by displacement*, often a displacement on to something very small or indifferent.[1] A tendency to a complete re-establishment of the repressed idea is as a rule unmistakably present. The failure in the repression of the quantitative, affective factor brings into play the same mechanism of flight, by means of avoidance and prohibitions, as we have seen at work in the formation of hysterical phobias. The rejection of the *idea* from the conscious is, however, obstinately maintained, because it entails abstention from action, a motor fettering of the impulsion. Thus in obsessional neurosis the work of repression is prolonged in a sterile and interminable struggle.

The short series of comparisons presented here may easily convince us that more comprehensive investigations are necessary before we can hope thoroughly to understand the processes connected with repression and the formation of neurotic symptoms. The extraordinary intricacy of all the factors to be taken into consideration leaves only one way of presenting them open to us. We must select first one and then another point of view, and follow it up through the material as long as the [158]
application of it seems to yield results. Each separate treatment of the subject will be incomplete in itself, and there cannot fail to be obscurities where it touches upon material that has not yet been treated; but we may hope that a final synthesis will lead to a proper understanding.

1 [Cf. Section II (*c*) of the 'Rat Man' analysis (1909*d*), *RSE*, **10**, 182 f.]

THE UNCONSCIOUS

The present translation is a revised and corrected reprint of the *SE* version.

This paper seems to have taken less than three weeks to write – from April 4 to April 23, 1915. It was published in the *Internationale Zeitschrift* later in the same year in two instalments, the first containing Sections I–IV, and the second Sections V–VII. In the editions before 1924 the paper was not divided into sections, but what are now the section headings were printed as side-headings in the margin. The only exception to this is that the words 'The Topographical Point of View', which are now part of the heading to Section II, were originally in the margin at the beginning of the second paragraph of the section at the words 'Proceeding now . . .' (p. 153 below). A few minor changes were also made in the text in the 1924 edition.

If the series of 'Papers on Metapsychology' may perhaps be regarded as the most important of all Freud's theoretical writings, there can be no doubt that the present essay on 'The Unconscious' is the culmination of that series.

The concept of there being unconscious mental processes is of course one that [162] is fundamental to psychoanalytic theory. Freud never tired of insisting upon the

arguments in support of it and combating the objections to it. Indeed, the very last unfinished scrap of his theoretical writing, the fragment written by him in 1938 to which he gave the English title 'Some Elementary Lessons in Psycho-Analysis' (1940*b*), is a fresh vindication of that concept.

It should be made clear at once, however, that Freud's interest in the assumption was never a philosophical one – though, no doubt, philosophical problems inevitably lay just round the corner. His interest was a *practical* one. He found that without making that assumption he was unable to explain or even to describe a large variety of phenomena which he came across. By making it, on the other hand, he found the way open to an immensely fertile region of fresh knowledge.

In his early days and in his nearest environment there can have been no great resistance to the idea. His immediate teachers – Meynert, for instance[1] – insofar as they were interested in psychology, were governed chiefly by the views of J. F. Herbart (1776–1841), and it seems that a textbook embodying the Herbartian principles was in use at Freud's secondary school (Jones, 1953, 409 f.). A recognition of the existence of unconscious mental processes played an essential part in Herbart's system. In spite of this, however, Freud did not immediately adopt the hypothesis in the earliest stages of his psychopathological researches. He seems from the first, it is true, to have felt the force of the argument on which stress is laid in the opening pages of the present paper – the argument, that is, that to restrict mental events to those that are conscious and to intersperse them with purely physical, neural events 'disrupts psychical continuities' and introduces unintelligible gaps into the chain of observed phenomena. But there were two ways in which this difficulty could be met. We might disregard the physical events and adopt the hypothesis that the gaps are filled with unconscious mental ones; but, on the other hand, we might disregard the conscious mental events and construct a purely physical chain, without any breaks in it, which would cover all the facts of observation. To Freud, whose
[163] early scientific career had been entirely concerned with physical science, this second possibility was at first irresistibly attractive. The attraction was no doubt strengthened by the views of Hughlings Jackson, of whose work he showed his admiration in his monograph on aphasia (1891*b*), *NSW*, **4**, a relevant passage from which can be found below in Appendix B (p. 183 ff.). The neurological method of describing psychopathological phenomena was accordingly the one which Freud began by adopting, and all his writings of the Breuer period are professedly based on that method. He became intellectually fascinated by the possibility of constructing a 'psychology' out of purely neurological ingredients, and devoted many months in the year 1895 to accomplishing the feat. Thus on April 27 of that year (Freud, 1950*a*, Letter 23) he wrote to Fliess: 'I am so deep in the "Psychology for Neurologists" that it quite consumes me, till I have to break off really overworked. I have never been so intensely preoccupied by anything. And will anything come of it? I hope so, but the going is hard and slow.' Something *did* come of it many months later – the torso which we know as the 'Project for a Scientific Psychology', despatched to Fliess in September and October, 1895. This astonishing production purports to describe and explain the whole range of human behaviour, normal and pathological, by means of a complicated manipulation of two material entities – the neuron and 'quantity in a

1 The possible influence on Freud in this respect of the physiologist Hering is discussed below in Appendix A (p. 181 f.).

state of flow', an unspecified physical or chemical energy. The need for postulating any unconscious mental processes was in this way entirely avoided: the chain of physical events was unbroken and complete.

There were no doubt many reasons why the 'Project' was never finished and why the whole line of thought behind it was before long abandoned. But the principal reason was that Freud the neurologist was being overtaken and displaced by Freud the psychologist: it became more and more obvious that the elaborate hypothetical workings of the machinery of the neuronal systems were far too speculative and coarse to deal with the observable phenomena which were being brought to light by 'psychological analysis' and which could only be accounted for in the language of mental processes. Ironically, this language now proved to be the more scientifically serviceable – and closer to the available empirical facts. A displacement of Freud's interest had, in fact, been very gradually taking place. Already at the time of the publication of the *Aphasia* his treatment of the case of Frau Emmy von N. lay two or three years behind him, and her case history was written more than a year before the 'Project'. It is in a footnote to that case history (*RSE*, **2**, 67 *n.* 2) that his first published use of the term 'the unconscious' is to be found; and though the *ostensible* theory underlying his share in the *Studies on Hysteria* (1895*d*) might be a neurological one, psychology, and with it the necessity for unconscious mental processes, was steadily creeping in. Indeed, the whole basis of the repression theory of hysteria, and of the cathartic method of treatment, cried out for a psychological explanation, and it was only by the most contorted efforts that they had been accounted for neurologically in Part II of the 'Project'.[1] A few years later, in *The Interpretation of Dreams* (1900*a*), a strange transformation had occurred: not only had the neurological account of psychology completely disappeared, but much of what Freud had written in the 'Project' in terms of the nervous system now turned out to be equally valid and intelligible when translated into mental terms. The unconscious was established once and for all. [164]

But, it must be repeated, what Freud established was no mere metaphysical entity. What he did in Chapter VII of *The Interpretation of Dreams* was, as it were, to clothe the metaphysical entity in flesh and blood. He showed for the first time what the unconscious was like, how it worked, how it differed from other parts of the mind, and what were its reciprocal relations with them. It was to these discoveries that he returned, amplifying and deepening them, in the paper which follows.

At an earlier stage, however, it had become evident that the term 'unconscious' was an ambiguous one. Three years previously, in the paper which he wrote in English for the Society for Psychical Research (1912*g*), *RSE*, **12**, and which is in many ways a preliminary to the present paper, he had carefully investigated these ambiguities, and had differentiated between the 'descriptive', 'dynamic' and 'systematic' uses of the word. He repeats the distinctions in Section II of this paper (p. 152 ff. below), though in a slightly different form; and he came back to them again in Chapter I of *The Ego and the Id* (1923*b*), *RSE*, **19**, and, at even greater length, in Lecture XXXI of the *New Introductory Lectures* (1933*a*), ibid., **22**. The untidy way in which the contrast between 'conscious' and 'unconscious' fits the differences between the various systems of the mind is already stated clearly below (p. 169 f.); but the whole

1 Oddly enough it was Breuer, in his theoretical contribution to the *Studies*, who was the first to make a reasoned defence of unconscious ideas (*RSE*, **2**, 198 f.).

[165] position was only brought into perspective when in *The Ego and the Id* Freud introduced a new structural picture of the mind. In spite, however, of the unsatisfactory operation of the criterion 'conscious or unconscious?', Freud always insisted (as he does in two places here, pp. 152 f. and 169 below, and again both in *The Ego and the Id* and in the *New Introductory Lectures*) that that criterion 'is in the last resort our one beacon-light in the darkness of depth psychology'.[1]

1 The closing words of Chapter I of *The Ego and the Id*. – For English readers, it must be observed, there is a further ambiguity in the word 'unconscious' which is scarcely present in the German. The German words '*bewusst*' and '*unbewusst*' have the grammatical form of passive participles, and their usual sense is something like 'consciously known' and 'not consciously known'. The English 'conscious', though it *can* be used in the same way, is also used, and perhaps more commonly, in an *active* sense: 'he was conscious of the sound' and 'he lay there unconscious'. The German terms do not often have this active meaning, and it is important to bear in mind that 'conscious' is in general to be understood in a passive sense in what follows. The German word '*Bewusstsein*', on the other hand (which is here translated 'consciousness'), *does* have an active sense. Thus, for instance, on p. 153 below Freud speaks of a psychical act becoming 'an object of consciousness'; again, in the last paragraph of the first section of the paper (p. 151) he speaks of 'the perception [of mental processes] by means of consciousness'; and in general, when he uses such phrases as 'our consciousness' he is referring to our consciousness *of* something. When he wishes to speak of a mental state's consciousness in the *passive* sense, he uses the word '*Bewusstheit*', which is translated here 'the attribute of being conscious', 'the fact of being conscious' or simply 'being conscious' – where the English 'conscious' is, as almost always in these papers, to be taken in the passive sense.

THE UNCONSCIOUS

We have learnt from psychoanalysis that the essence of the process of repression [*Verdrängung*][T] lies, not in putting an end to, in annihilating, the idea [*Vorstellung*][T] which represents a drive [*Trieb*][T], but in preventing it from becoming conscious. When this happens we say of the idea that it is in a state of being 'unconscious [*Unbewussten*]',[1] and we can produce good evidence to show that even when it is unconscious it can produce effects, even including some which finally reach consciousness. Everything that is repressed must remain unconscious; but let us state at the very outset that the repressed does not cover everything that is unconscious. The unconscious has the wider compass: the repressed is a part of the unconscious. [166]

How are we to arrive at a knowledge of the unconscious? It is of course only as something conscious that we know it, after it has undergone transformation or translation [*Übersetzung*][T] into something conscious. Psychoanalytic work shows us every day that translation of this kind is possible. In order that this should come about, the person under analysis must overcome certain resistances – the same resistances as those which, earlier, made the material concerned into something repressed by rejecting it from the conscious.

I. JUSTIFICATION FOR THE CONCEPT OF THE UNCONSCIOUS

Our right to assume the existence of something mental [*Seelisches*][T] that is unconscious and to employ that assumption for the purposes of scientific work is disputed in many quarters. To this we can reply that our assumption of the unconscious is *necessary* and *legitimate*, and that we possess numerous proofs of its existence. *Seele*

It is *necessary* because the data of consciousness have a very large number of gaps in them; both in healthy and in sick people psychical acts

1 [See Editors' Note above, p. 146 *n.*]

often occur which can be explained only by presupposing other acts, of which, nevertheless, consciousness affords no evidence. These not only include parapraxes [*Fehlhandlungen*][T] and dreams in healthy people, and everything described as a psychical symptom or an obsession [*Zwangserscheinungen*][T] in the sick; our most personal daily experience acquaints us with ideas [*mit Einfällen*][T] that come into our head we do not know from where, and with intellectual conclusions arrived at we do not know how. All these conscious acts remain disconnected and unintelligible if we insist upon claiming that every mental act that occurs in us must also necessarily be experienced by us through consciousness; on the other hand, they fall into a demonstrable connection if we interpolate between them the unconscious acts which we have inferred. A gain in meaning [*Sinn*] and connection[1] is a perfectly justifiable ground for going beyond the limits of direct experience. When, in addition, it turns out that the assumption of there being an unconscious enables us to construct a successful procedure by which we can exert an effective influence upon the course of conscious processes, this success will have given us an incontrovertible proof of the existence of what we have assumed. This being so, we must adopt the position that to require that whatever goes on in the mind must also be known to consciousness is to make an untenable claim.

Zwang
[167]

We can go further and argue, in support of there being an unconscious psychical state, that at any given moment consciousness includes only a small content, so that the greater part of what we call conscious knowledge must in any case be for very considerable periods of time in a state of latency, that is to say, of being psychically unconscious. When all our latent memories are taken into consideration it becomes totally incomprehensible how the existence of the unconscious can be denied. But here we encounter the objection that these latent recollections can no longer be described as psychical, but that they correspond to residues of somatic processes from which what is psychical can once more arise. The obvious answer to this is that a latent memory is, on the contrary, an unquestionable residuum of a *psychical* process. But it is more important to realize clearly that this objection is based on the equation – not, it is true, explicitly stated but taken as axiomatic – of what is conscious with what is mental. This equation is either a *petitio principii* which begs the question whether everything that is psychical is also necessarily conscious; or else it is a matter of convention, of nomenclature. In this latter case it is, of course, like any other convention, not open to refutation.

1 [The last two words were accidentally omitted in the *SE* translation.]

The question remains, however, whether the convention is so expedient that we are bound to adopt it. To this we may reply that the conventional equation of the psychical with the conscious is totally inexpedient. It [168] disrupts psychical continuities, plunges us into the insoluble difficulties of psychophysical parallelism,[1] is open to the reproach that for no obvious reason it overestimates the part played by consciousness, and that it forces us prematurely to abandon the field of psychological research without being able to offer us any compensation from other fields.

It is clear in any case that this question – whether the latent states of mental life, whose existence is undeniable, are to be conceived of as unconscious[2] mental states or as physical ones – threatens to resolve itself into a verbal dispute. We shall therefore be better advised to focus our attention on what we know with certainty of the nature of these debatable states. As far as their physical characteristics are concerned, they are totally inaccessible to us: no physiological concept or chemical process can give us any notion of their nature. On the other hand, we know for certain that they have abundant points of contact with conscious mental processes; with the help of a certain amount of work they can be transformed into, or replaced with, conscious mental processes, and all the categories which we employ to describe conscious mental acts, such as ideas, purposes, resolutions and so on, can be applied to them. Indeed, we are obliged to say of some of these latent states that the only respect in which they differ from conscious ones is precisely in the absence of consciousness. Thus we shall not hesitate to treat them as objects of psychological research, and to deal with them in the most intimate connection with conscious mental acts.

The stubborn denial of a psychical character to latent mental acts is accounted for by the circumstance that most of the phenomena concerned have not been the subject of study outside psychoanalysis. Anyone who is ignorant of pathological facts, who regards the parapraxes of normal people as accidental, and who is content with the old saw that dreams are froth ['*Träume seien Schäume*'][3] has only to ignore a few more problems of the psychology of consciousness in order to spare himself any need to assume an unconscious mental activity. Incidentally, even before the time of psychoanalysis, hypnotic experiments, and

1 [Freud seems himself at one time to have been inclined to accept this conception, as is suggested by a passage in his book on aphasia (1891*b*, 56 ff.; *NSW*, **4**, Chapter V). This can be found translated below in Appendix B (p. 183 ff.).]

2 [*unbewusste* – translated 'conscious' in the *SE*, no doubt accidentally.]

3 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 118.]

[169] especially post-hypnotic suggestion, had tangibly demonstrated the existence and mode of operation of the mental unconscious.[1]

The assumption of an unconscious is, moreover, a perfectly *legitimate* one, inasmuch as in postulating it we are not departing a single step from our customary and generally accepted mode of thinking. Consciousness makes each of us aware only of his own states of mind; that other people, too, possess a consciousness is an inference which we draw by analogy from their observable utterances and actions, in order to make this behaviour of theirs intelligible to us. (It would no doubt be psychologically more correct to put it in this way: that without any special reflection we attribute to everyone else our own constitution and therefore our consciousness as well, and that this identification is a *sine qua non* of our understanding.) This inference (or this identification) was formerly extended by the ego [*Ich*][T] to other human beings, to animals, plants, inanimate objects and to the world at large, and proved serviceable so long as their similarity to the individual ego was overwhelmingly great; but it became more untrustworthy in proportion as the difference between the ego and these 'others' widened. Today, our critical judgement is already in doubt on the question of consciousness in animals; we refuse to admit it in plants and we regard the assumption of its existence in inanimate matter as mysticism. But even where the original inclination to identification has withstood criticism – that is, when the 'others' are our fellow men – the assumption of a consciousness in them rests upon an inference and cannot share the immediate certainty which we have of our own consciousness.

Psychoanalysis demands nothing more than that we should apply this process of inference to ourselves also – a proceeding to which, it is true, we are not constitutionally inclined. If we do this, we must say: all the acts and manifestations which I notice in myself and do not know how to link up with the rest of my mental life must be judged as if they belonged to someone else: they are to be explained by a mental life ascribed to this other person. Furthermore, experience shows that we understand very well how to interpret in other people (that is, how to fit into their chain
[170] of mental events) the same acts which we refuse to acknowledge as being mental in ourselves. Here some special hindrance evidently deflects our investigations from our own self and prevents our obtaining a true knowledge of it.

1 [In his very last discussion of the subject, in the unfinished fragment 'Some Elementary Lessons in Psycho-Analysis' (1940*b*), *RSE*, **23**, Freud entered at some length into the evidence afforded by post-hypnotic suggestion.]

This process of inference, when applied to oneself in spite of internal opposition, does not, however, lead to the disclosure of an unconscious; it leads logically to the assumption of another, second consciousness which is united in one's self with the consciousness one knows. But at this point, certain criticisms may fairly be made. In the first place, a consciousness of which its own possessor knows nothing is something very different from a consciousness belonging to another person, and it is questionable whether such a consciousness, lacking, as it does, its most important characteristic, deserves any discussion at all. Those who have resisted the assumption of an unconscious *psychical* are not likely to be ready to exchange it for an unconscious *consciousness*. In the second place, analysis shows that the different latent mental processes inferred by us enjoy a high degree of mutual independence, as though they had no connection with one another, and knew nothing of one another. We must be prepared, if so, to assume the existence in us not only of a second consciousness, but of a third, fourth, perhaps of an unlimited number of states of consciousness, all unknown to us and to one another. In the third place – and this is the most weighty argument of all – we have to take into account the fact that analytic investigation reveals some of these latent processes as having characteristics and peculiarities which seem alien to us, or even incredible, and which run directly counter to the attributes of consciousness with which we are familiar. Thus we have grounds for modifying our inference about ourselves and saying that what is proved is not the existence of a second consciousness in us, but the existence of psychical acts which lack consciousness. We shall also be right in rejecting the term 'subconsciousness' as incorrect and misleading.[1] The well-known cases of '*double conscience*'[2] (splitting of consciousness) prove nothing against our view. We may most aptly [171]
describe them as cases of a splitting of the mental activities into two groups, and say that the same consciousness turns to one or the other of these groups alternately.

In psychoanalysis there is no choice for us but to assert that mental processes are in themselves [*an sich*] unconscious, and to liken the perception of them by means of consciousness to the perception of the

1 [In some of his very early writings, Freud himself used the term 'subconscious', e.g. in his French paper on hysterical paralyses (1893*c*), *NSW*, **4**; *RSE*, **1**, 198, and in *Studies on Hysteria* (1895*d*), ibid., **2**, 62 *n*. But he disrecommends the term as early as in *The Interpretation of Dreams* (1900*a*), ibid., **5**, 549. He alludes to the point again in Lecture XIX of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 262, and argues it a little more fully near the end of Chapter II of *The Question of Lay Analysis* (1926*e*), ibid., **20**, 176.]

2 [The French term for 'dual consciousness'.]

external world by means of the sense organs.[1] We can even hope to gain fresh knowledge from the comparison. The psychoanalytic assumption of unconscious mental activity appears to us, on the one hand, as a further expansion of the primitive animism which caused us to see copies of our own consciousness all around us, and, on the other hand, as an extension of the corrections undertaken by Kant of our views on external perception. Just as Kant warned us not to overlook the fact that our perceptions are subjectively conditioned and must not be regarded as identical to what is perceived though unknowable, so psychoanalysis warns us not to equate perceptions by means of consciousness with the unconscious mental processes which are their object. Like the physical, the psychical is not necessarily in reality what it appears to us to be. We shall be glad to learn, however, that the correction of internal perception will turn out not to offer such great difficulties as the correction of external perception – that internal objects are less unknowable than the external world.

II. VARIOUS MEANINGS OF 'THE UNCONSCIOUS' – THE TOPOGRAPHICAL POINT OF VIEW

[172] Before going any further, let us state the important, though inconvenient, fact that the attribute of being unconscious is only one feature that is found in the psychical and is by no means sufficient fully to characterize it. There are psychical acts of very varying value which yet agree in possessing the characteristic of being unconscious. The unconscious comprises, on the one hand, acts which are merely latent, temporarily unconscious, but which differ in no other respect from conscious ones and, on the other hand, processes such as repressed ones, which if they were to become conscious would be bound to stand out in the crudest contrast to the rest of the conscious processes. It would put an end to all misunderstandings if, from now on, in describing the various kinds of psychical acts we were to disregard the question of whether they were conscious or unconscious, and were to classify and correlate them only according to their relation to drives and aims, according to their composition and according to which of the hierarchy of psychical systems they belong to. This, however, is for various reasons impracticable, so that we cannot escape the ambiguity of using the words 'conscious' and 'unconscious' sometimes in a

1 [This idea had already been dealt with at some length in Chapter VII (F) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 550–2.]

descriptive and sometimes in a systematic sense, in which latter they signify inclusion in particular systems and possession of certain characteristics. We might attempt to avoid confusion by giving the psychical systems which we have distinguished certain arbitrarily chosen names which have no reference to the attribute of being conscious. Only we should first have to specify what the grounds are on which we distinguish the systems, and in doing this we should not be able to evade the attribute of being conscious, seeing that it forms the point of departure for all our investigations.[1] Perhaps we may look for some assistance from the proposal to employ, at any rate in writing, the abbreviation *Cs.* for consciousness and *Ucs.* for what is unconscious, when we are using the two words in the systematic sense.[2]

Proceeding now to an account of the positive findings of psychoanalysis, [173]
we may say that in general a psychical act goes through two phases as regards its state, between which is interposed a kind of testing (*censorship*). In the first phase the psychical act is unconscious and belongs to the system *Ucs.*; if, on testing, it is rejected by the censorship, it is not allowed to pass into the second phase; it is then said to be 'repressed' and must remain unconscious. If, however, it passes this testing, it enters the second phase and thenceforth belongs to the second system, which we will call the system *Cs.* But the fact that it belongs to that system does not yet unequivocally determine its relation to consciousness. It is not yet conscious, but it is certainly *capable of becoming conscious* (to use Breuer's expression)[3] – that is, it can now, given certain conditions, become an object of consciousness without any special resistance. In consideration of this capacity for becoming conscious we also call the system *Cs.* the 'preconscious'. If it should turn out that a certain censorship also plays a part in determining whether the preconscious becomes conscious, we shall discriminate more sharply between the systems *Pcs.* and *Cs.* [Cf. p. 169 below.] For the present let it suffice us to bear in mind that the system *Pcs.* shares the characteristics of the system *Cs.* and that the rigorous censorship exercises its office at the point of transition from the *Ucs.* to the *Pcs.* (or *Cs.*).

By accepting the existence of these two (or three) psychical systems, psychoanalysis has departed a step further from the descriptive

1 [Freud returns to this below on p. 169.]

2 [Freud had already introduced these abbreviations in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 483 ff.]

3 [See *Studies on Hysteria*, Breuer & Freud (1895*d*), ibid., **2**, 200.]

'psychology of consciousness' and has raised new problems and acquired a new content. Up till now, it has differed from that psychology mainly by reason of its *dynamic* view of mental processes; now in addition it seems to take account of psychical *topography* as well, and to indicate in respect of any given mental act within what system or between what systems it takes place. On account of this attempt, too, it has been given the name of 'depth psychology'.[1] We shall hear that it can be further enriched by taking yet another point of view into account. [Cf. p. 160 below.]

[174] If we are to take the topography of mental acts seriously we must direct our interest to a doubt which arises at this point. When a psychical act (let us confine ourselves here to one which is in the nature of an idea[2]) is transposed from the system *Ucs*. into the system *Cs*. (or *Pcs*.), are we to suppose that this transposition involves a fresh record – as it were, a second registration – of the idea in question, which may thus be situated as well in a fresh psychical locality, and alongside of which the original unconscious registration continues to exist?[3] Or are we rather to believe that the transposition consists in a change in the state of the idea, a change involving the same material and occurring in the same locality? This question may appear abstruse, but it must be raised if we wish to form a more definite conception of psychical topography, of the dimension of depth in the mind. It is a difficult one because it goes beyond pure psychology and touches on the relations of the mental apparatus to anatomy. We know that in the very roughest sense such relations exist. Research has given irrefutable proof that mental activity is bound up with the function of the brain as it is with no other organ. We are taken a step further – we do not know how much – by the discovery of the unequal importance of the different parts of the brain and their special relations to particular parts of the body and to particular mental activities. But every attempt to go on from there to discover a localization of mental processes, every endeavour to think of ideas as stored up in nerve cells and of excitations [*Erregungen*][T] as travelling along nerve fibres, has

1 [By Bleuler (1914). See the 'History of the Psychoanalytic Movement' (1914*d*), above, p. 36.]

2 [The German word here is '*Vorstellung*', which covers the English terms 'idea', 'image' and 'presentation'. See *RSE*, **24**, 94–8.]

3 [The conception of an idea being present in the mind in more than one 'registration' was first put forward by Freud in a letter to Fliess of December 6, 1896 (Freud, 1950*a*, Letter 52). It is used in connection with the theory of memory in Chapter VII (Section B) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 481 f.; and it is alluded to again in Section F of the same chapter (ibid., 545 ff.) in an argument which foreshadows the present one.]

miscarried completely.[1] The same fate would await any theory which attempted to recognize, let us say, the anatomical position of the system *Cs.* – conscious mental activity – as being in the cortex, and to localize the unconscious processes in the subcortical parts of the brain.[2] There is a hiatus here which at present cannot be filled, nor is it one of the tasks of psychology to fill it. Our psychical topography has *for the present* nothing to do with anatomy; it has reference not to anatomical localities, but to regions in the mental apparatus, wherever they may be situated in the body. [175]

In this respect, then, our work is untrammelled and may proceed according to its own requirements. It will, however, be useful to remind ourselves that as things stand our hypotheses set out to be no more than graphic illustrations. The first of the two possibilities which we considered – namely, that the *Cs.* phase of an idea implies a fresh registration of it, which is situated in another place – is doubtless the cruder but also the more convenient. The second hypothesis – that of a merely *functional* change of state – is *a priori* more probable, but it is less plastic, less easy to manipulate. With the first, or topographical, hypothesis is bound up that of a topographical separation of the systems *Ucs.* and *Cs.* and also the possibility that an idea may exist simultaneously in two places in the mental apparatus – indeed, that if it is not inhibited [*ungehemmt*][T] by the censorship, it regularly advances from the one position to the other, possibly without losing its first location or registration. *Hemmung*

This view may seem odd, but it can be supported by observations from psychoanalytic practice. If we communicate to a patient some idea which he has at one time repressed but which we have discovered in him, our telling him makes at first no change in his mental condition. Above all, it does not remove the repression nor undo its effects, as might perhaps be expected from the fact that the previously unconscious idea has now become conscious. On the contrary, all that we shall achieve at first will be a fresh rejection of the repressed idea. But now the patient has in actual fact the same idea in two forms in different places in his mental apparatus: first, he has the conscious memory of the auditory trace of the idea, conveyed in what we told him; and secondly, he also has – as we

1 [Freud himself had endeavoured to think of ideas as stored up in nerve cells and of excitations as migrating along nerve fibres, in his 'Project' (1950*a* [1895]), which, in his own estimation, miscarried completely. He had also been much concerned with the question of the localization of mental processes in his work on aphasia (1891*b*), *NSW*, **4**.]

2 [Freud had insisted on this as early as in his Preface to his translation of Bernheim's *De la suggestion* (Freud, 1888–89*a*). However, he later recognized the anatomical position of the system *Pcpt.-Cs.* as being in the cortex. Cf. Freud (1920*g*), *RSE*, **18**, 24, (1923*b*), ibid., **19**, 16 and 22, and (1939*a*), ibid., **23**, 89.]

know for certain – the unconscious memory of his experience as it was in its earlier form.[1] Actually there is no lifting of the repression until the
[176] conscious idea, after the resistances have been overcome, has entered into connection with the unconscious memory trace. It is only through the making conscious of the latter itself that success is achieved. On superficial consideration this would seem to show that conscious and unconscious ideas are distinct registrations, topographically separated, of the same content. But a moment's reflection shows that the identity of the information given to the patient with his repressed memory is only apparent. To have heard something and to have experienced something are in their psychological nature two quite different things, even though the content of both is the same.

So for the moment we are not in a position to decide between the two possibilities that we have discussed. Perhaps later on we shall come upon factors which may turn the balance in favour of one or the other. Perhaps we shall make the discovery that our question was inadequately framed and that the difference between an unconscious and a conscious idea has to be defined in quite another way.[2]

III. UNCONSCIOUS FEELINGS

[177] We have limited the foregoing discussion to ideas; we may now raise a new question, the answer to which is bound to contribute to the elucidation of our theoretical views. We have said that there are conscious and unconscious ideas; but are there also unconscious drive impulses
Regung [*Triebregungen*][T], emotions and feelings, or is it in this instance meaningless to form combinations of the kind?

I am in fact of the opinion that the antithesis of conscious and unconscious is not applicable to drives. A drive can never become an object of consciousness – only the idea that represents the drive can. Even in the unconscious, moreover, a drive cannot be represented otherwise than by an idea. If the drive did not attach itself to an idea or manifest itself as an affective state, we could know nothing about it. When we nevertheless speak of an unconscious drive impulse or of a repressed drive impulse, the looseness of phraseology is a harmless one. We can only mean a drive

1 [The topographical picture of the distinction between conscious and unconscious ideas is presented in Freud's discussion of the case of 'Little Hans' (1909*b*), *RSE*, **10**, 92 f., and at greater length in the closing paragraphs of his technical paper 'On Beginning the Treatment' (1913*c*), ibid., **12**, 137–8.]

2 [This argument is taken up again on p. 177 below.]

impulse the ideational representative of which is unconscious, for nothing else comes into consideration.[1]

We should expect the answer to the question about unconscious feelings, emotions and affects to be just as easily given. It is surely of the essence of an emotion that we should be aware of it, i.e. that it should become known to consciousness. Thus the possibility of the attribute of unconsciousness would be completely excluded as far as emotions, feelings and affects are concerned. But in psychoanalytic practice we are accustomed to speak of unconscious love, hate, anger, etc., and find it impossible to avoid even the strange conjunction, 'unconscious consciousness of guilt',[2] or a paradoxical 'unconscious anxiety'. Is there more meaning in the use of these terms than there is in speaking of 'unconscious drives'?

The two cases are, in fact, not on all fours. In the first place, it may happen that an affective or emotional impulse is perceived but misconstrued. Owing to the repression of its proper representative it has been forced to become connected with another idea, and is now regarded by [178]
consciousness as the manifestation of that idea. If we restore the true connection, we call the original affective impulse an 'unconscious' one. Yet its affect was never unconscious; all that had happened was that its *idea* had undergone repression. In general, the use of the terms 'unconscious affect' and 'unconscious emotion' has reference to the vicissitudes [*Schicksale*][T] undergone, in consequence of repression, by the quantitative factor in the drive impulse. We know that three such vicissitudes are possible:[3] either the affect remains, wholly or in part, as it is; or it is transformed into a qualitatively different quota of affect, above all into anxiety; or it is suppressed, i.e. it is prevented from developing at all. (These possibilities may perhaps be studied even more easily in the dream-work than in neuroses.[4]) We know, too, that to suppress the development of affect is the true aim of repression and that its work is incomplete if this aim is not achieved. In every instance where repression has succeeded in inhibiting the development of affects, we term those affects (which we restore when we undo the work of repression) 'unconscious'. Thus it cannot be denied that the use of the terms in question is consistent; but in comparison with unconscious ideas there is the

1 [Cf. the Editors' Note to 'Drives and their Vicissitudes', p. 99 ff. above.]

2 [German '*Schuldbewusstsein*', a common equivalent for '*Schuldgefühl*', 'sense of guilt'.]

3 Cf. the preceding paper on 'Repression' [p. 135 above].

4 [The main discussion of affects in *The Interpretation of Dreams* (1900*a*) can be found in Section H of Chapter VI; *RSE*, **5**, 411–36.]

important difference that unconscious ideas continue to exist after repression as actual structures [*reale Bildung*]^{T} in the system *Ucs.*, whereas all that corresponds in that system to unconscious affects is a potential beginning which is prevented from developing. Strictly speaking, then, and although no fault can be found with the linguistic usage, there are no unconscious affects as there are unconscious ideas. But there may very well be in the system *Ucs.* affective structures which, like others, become conscious. The whole difference arises from the fact that ideas are cathexes [*Besetzungen*]^{T} – basically of memory traces – while affects and feelings correspond to processes of discharge [*Abfuhrvorgängen*]^{T}, the final manifestations of which are perceived as sensations. In the present state of our knowledge of affects and feelings we cannot express this difference more clearly.[1]

abführen

It is of special interest to us to have established the fact that repression can succeed in inhibiting a drive impulse from being turned into a manifestation of affect. This shows us that the system *Cs.* normally controls affectivity as well as access to motility; and it enhances the importance of repression, since it shows that repression results not only in withholding things from consciousness, but also in preventing the development of affect and the setting off of muscular activity. Conversely, too, we may say that as long as the system *Cs.* controls affectivity and motility, the mental condition of the person in question is spoken of as normal. Nevertheless, there is an unmistakable difference in the relation of the controlling system to the two contiguous processes of discharge.[2] Whereas the control by the *Cs.* over voluntary motility is firmly rooted, regularly withstands the onslaught of neurosis and only breaks down in psychosis, control by the *Cs.* over the development of affects is less secure. Even within the limits of normal life we can recognize that a constant struggle for primacy over affectivity goes on between the two systems *Cs.* and *Ucs.*, that certain spheres of influence are marked off from one another and that intermixtures between the operative forces [*Kräfte*]^{T} occur.

[179]

1 [This question is discussed again in Chapter II of *The Ego and the Id* (1923*b*), *RSE*, **19**, 18–19. The nature of affects is more clearly discussed in Lecture XXV of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 349–50, and also in Chapter VII of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 117–18. This entire section harks back to Freud's fundamental hypothesis to the effect that mental activity involves two basic components: a 'quota of affect' and 'memory traces of ideas' (1894*a*; see Editors' Appendix, ibid., **3**, 57 ff.).]

2 Affectivity manifests itself essentially in motor (secretory and vasomotor) discharge resulting in an (internal) alteration of the subject's own body without reference to the external world; motility, in actions designed to effect changes in the external world.

The importance of the system *Cs.* (*Pcs.*)[1] as regards access to the release of affect and to action enables us also to understand the part played by substitutive ideas in determining the form taken by illness. It is possible for the development of affect to proceed directly from the system *Ucs.*; in that case the affect always has the character of anxiety, for which all 'repressed' affects are exchanged. Often, however, the drive impulse has to wait until it has found a substitutive idea in the system *Cs.* The development of affect can then proceed from this conscious substitute, and the nature of that substitute determines the qualitative character of the affect. We have asserted [p. 135 above] that in repression a severance takes place between the affect and the idea to which it belongs, and that each then undergoes its separate vicissitudes. Descriptively, this is incontrovertible; in actuality, however, the affect does not as a rule arise till the breakthrough to a new representation in the system *Cs.* has been successfully achieved.

IV. TOPOGRAPHY AND DYNAMICS OF REPRESSION

We have arrived at the conclusion that repression is essentially a process affecting ideas on the border between the systems *Ucs.* and *Pcs.* (*Cs.*), and we can now make a fresh attempt to describe the process in greater detail. [180]

It must be a matter of a *withdrawal* of cathexis; but the question is, in which system does the withdrawal take place and to which system does the cathexis that is withdrawn belong? The repressed idea remains capable of action in the *Ucs.*, and it must therefore have retained its cathexis. What has been withdrawn must be something else. [Cf. p. 177 f. below.] Let us take the case of repression proper ('after-pressure') [p. 131 above], as it affects an idea which is preconscious or even actually conscious. Here repression can only consist in withdrawing from the idea the (pre)conscious cathexis which belongs to the system *Pcs.* The idea then either remains uncathected, or receives cathexis from the *Ucs.*, or retains the *Ucs.* cathexis which it already had. Thus there is a withdrawal of the preconscious cathexis, retention of the unconscious cathexis, or replacement of the preconscious cathexis with an unconscious one. We notice, moreover, that we have based these reflections (as it were, without meaning to) on the assumption that the transition from the system *Ucs.* to the system next to it is not effected through the making of a new registration but through a change in its state, an alteration in its cathexis. The

1 [In the 1915 edition only, '(*Pcs.*)' does not occur.]

functional hypothesis has here easily defeated the topographical one. [See above, pp. 154–5.]

But this process of withdrawal of libido[1] is not adequate to make another characteristic of repression comprehensible to us. It is not clear why the idea which has remained cathected or has received cathexis from the *Ucs*. should not, by virtue of its cathexis, renew the attempt to penetrate into the system *Pcs*. If it could do so, the withdrawal of libido from it would have to be repeated, and the same performance would go on endlessly; but the outcome would not be repression. So, too, when it comes to describing *primal* repression, the mechanism just discussed of withdrawal of preconscious cathexis would fail to meet the case; for here we are dealing with an unconscious idea which has as yet received *no* cathexis from the *Pcs*. and therefore cannot have that cathexis withdrawn from it.

[181]

What we require, therefore, is another process which maintains the repression in the first case [i.e. the case of after-pressure] and, in the second [i.e. that of primal repression], ensures its being established as well as continued. This other process can only be found in the assumption of an *anticathexis*, by means of which the system *Pcs*. protects itself from the pressure upon it of the unconscious idea. We shall see from clinical examples how such an anticathexis, operating in the system *Pcs.*, manifests itself. It is this which represents the permanent expenditure [of energy] of a primal repression, and which also guarantees the permanence of that repression. Anticathexis is the sole mechanism of primal repression; in the case of repression proper ('after-pressure') there is in addition withdrawal of the *Pcs.* cathexis. It is very possible that it is precisely the cathexis which is withdrawn from the idea that is used for anticathexis.

We see how we have gradually been led into adopting a third point of view in our account of psychical phenomena. Besides the dynamic and the topographical points of view [p. 154 above], we have adopted the *economic* one. This endeavours to follow the vicissitudes of amounts of excitation [*Erregungsgrössen*] and to arrive at least at some *relative* estimate of their magnitude.

It will not be unreasonable to give a special name to this whole way of regarding our subject matter, for it is the consummation of psychoanalytic research. I propose that when we have succeeded in describing a psychical process in its dynamic, topographical and economic aspects,

1 [For the use of 'libido' here see four paragraphs lower down.]

we should speak of it as a *metapsychological*[1] presentation. We must say at once that in the present state of our knowledge there are only a few points at which we shall succeed in this.

Let us make a tentative effort to give a metapsychological description of the process of repression in the three transference neuroses [*Übertragungsneurosen*] which are familiar to us. Here we may replace 'cathexis' with 'libido',[2] because, as we know, it is the vicissitudes of *sexual* impulses with which we shall be dealing. [182]

In anxiety hysteria a first phase of the process is frequently overlooked, and may perhaps be in fact missed out; on careful observation, however, it can be clearly discerned. It consists in anxiety appearing without the subject knowing what he is afraid of. We must suppose that there was present in the *Ucs*. some love impulse demanding to be transposed into the system *Pcs*.; but the cathexis directed to it from the latter system has drawn back from the impulse (as though in an attempt at flight) and the unconscious libidinal cathexis of the rejected idea has been discharged in the form of anxiety.

On the occasion of a repetition (if there should be one) of this process, a first step is taken in the direction of mastering the unwelcome development of anxiety.[3] The [*Pcs*.] cathexis that has taken flight attaches itself to a substitutive idea which, on the one hand, is connected by association with the rejected idea, and, on the other, has escaped repression by reason of its remoteness from that idea. This substitutive idea – a 'substitute by displacement' [*Verschiebungsersatz*][T] [p. 137 above] – permits the still uninhibitable development of anxiety to be rationalized. It now plays the part of an anticathexis for the system *Cs*. (*Pcs*.),[4] by securing it against an emergence in the *Cs*. of the repressed idea. On the other hand, it is, or acts as if it were, the point of departure for the release of the anxiety affect, which has now really become quite uninhibitable. Clinical observation shows, for instance, that a child suffering from an animal phobia experiences anxiety under two kinds of conditions: in the first place, when his repressed love impulse becomes intensified, and, in the second, when he perceives the animal he is afraid of. The substitutive idea acts in the one instance as a point at which there is a passage across from the *Verschiebung*

1 [Freud had first used this term some twenty years earlier in a letter to Fliess of February 13, 1896. (Freud, 1950*a*, Letter 41.) He had only used it once before in his *published* works: in the *Psychopathology of Everyday Life* (1901*b*), Chapter XII (C); *RSE*, **6**, 222.]

2 [Freud had already done this four paragraphs earlier.]

3 [This is the 'second phase' of the process.]

4 [In the 1915 edition only '(*Pcs*.)' does not occur.]

system *Ucs*. to the system *Cs*., and, in the other instance, as a self-sufficing source for the release of anxiety. The extending dominance of the system *Cs*. usually manifests itself in the fact that the first of these two modes of excitation of the substitutive idea gives place more and more to the second. The child may perhaps end by behaving as though he had no
[183] predilection whatever towards his father but had become quite free from him, and as though his fear of the animal was a real fear – except that this fear of the animal, fed as such a fear is from an unconscious drive source, proves obdurate and exaggerated in the face of all influences brought to bear from the system *Cs*., and thereby betrays its derivation from the system *Ucs*. – In the second phase of anxiety hysteria, therefore, the anticathexis from the system *Cs*. has led to substitute formation.

Soon the same mechanism finds a fresh application. The process of repression, as we know, is not yet completed, and it finds a further aim in the task of inhibiting the development of the anxiety which arises from the substitute.[1] This is achieved by the whole of the associated environment of the substitutive idea being cathected with special intensity, so that it can display a high degree of sensibility to excitation. Excitation of any point in this outer structure [*Vorbaues*] must inevitably, on account of its connection with the substitutive idea, give rise to a slight development of anxiety; and this is now used as a signal to inhibit, by means of a fresh flight on the part of the [*Pcs*.] cathexis, the further progress of the development of anxiety.[2] The further away the sensitive and vigilant anticathexes are situated from the feared substitute, the more precisely can the mechanism function which is designed to isolate the substitutive idea and to protect it from fresh excitations. These precautions naturally only guard against excitations which approach the substitutive idea from outside, through perception; they never guard against drive excitation, which reaches the substitutive idea from the direction of its link with the repressed idea. Thus the precautions do not begin to operate till the substitute has satisfactorily taken over representation of the repressed, and they can never operate with complete reliability. With each increase of drive excitation the protecting rampart round the substitutive idea must be shifted a little further outwards. The whole construction, which is set up in an analogous way in the other neuroses, is termed a *phobia*. The flight from a conscious
[184] cathexis of the substitutive idea is manifested in the avoidances,

1 [The 'third phase'.]

2 [The notion of a small release of unpleasure acting as a 'signal' to prevent a much larger release is already to be found in Freud's 1895 'Project' (1950*a*, Part II, Section 6), *RSE*, **1**, and in *The Interpretation of Dreams* (1900*a*), ibid., **5**, 539. The idea is, of course, developed much further in *Inhibitions, Symptoms and Anxiety* (1926*d*), e.g. in Chapter XI, Section A (*b*); ibid., **20**, 142 ff.]

renunciations and prohibitions by which we recognize anxiety hysteria.

Surveying the whole process, we may say that the third phase repeats the work of the second on an ampler scale. The system *Cs*. now protects itself against the activation of the substitutive idea by an anticathexis of its environment, just as previously it had secured itself against the emergence of the repressed idea by a cathexis of the substitutive idea. In this way the formation of substitutes by displacement has been further continued. We must also add that the system *Cs*. had earlier only one small area at which the repressed drive impulse could break through, namely, the substitutive idea; but that ultimately this enclave of unconscious influence extends to the whole phobic outer structure. Further, we may lay stress on the interesting consideration that by means of the whole defensive mechanism [*Abwehrmechanismus*][T] thus set in action a pro- *Abwehr*
jection outwards of the drive danger has been achieved. The ego behaves as if the danger of a development of anxiety threatened it not from the direction of a drive impulse but from the direction of a perception, and it is thus enabled to react against this external danger with the attempts at flight represented by phobic avoidances. In this process repression is successful in one particular: the release of anxiety can to some extent be dammed up, but only at a heavy sacrifice of personal freedom. Attempts at flight from the demands of drive are, however, in general useless, and, in spite of everything, the result of phobic flight remains unsatisfactory.

A great deal of what we have found in anxiety hysteria also holds good for the other two neuroses, so that we can confine our discussion to their points of difference and to the part played by anticathexis. In conversion hysteria the drive cathexis of the repressed idea is changed into the innervation of the symptom. How far and in what circumstances the unconscious idea is drained empty by this discharge into innervation, so that it can relinquish its pressure upon the system *Cs*. – these and similar questions had better be reserved for a special investigation of hysteria.[1]
In conversion hysteria the part played by the anticathexis proceeding [185]
from the system *Cs*. (*Pcs*.)[2] is clear and becomes manifest in the formation of the symptom. It is the anticathexis that decides upon what portion of the drive representative [*Triebrepräsentanz*] the whole cathexis of the latter is able to be concentrated. The portion thus selected to be a symptom fulfils the condition of expressing the wishful aim of the drive

1 [Probably a reference to the missing metapsychological paper on conversion hysteria. (See Editors' Introduction, p. 93 ff. above.) – Freud had already touched on the question in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 147–8.]

2 [In the 1915 edition only, '(*Pcs*.)' does not occur.]

impulse no less than the defensive or punitive efforts of the system *Cs.*; thus it becomes hypercathected, and it is maintained from both directions like the substitutive idea in anxiety hysteria. From this circumstance we may conclude without hesitation that the amount of energy expended by the system *Cs.* on repression need not be so great as the cathectic energy of the symptom; for the strength of the repression is measured by the amount of anticathexis expended, whereas the symptom is supported not only by this anticathexis but also by the drive cathexis from the system *Ucs.* which is condensed [*verdichtete*][T] in the symptom.

Verdichtung

As regards obsessional neurosis, we need only add to the observations brought forward in the preceding paper [p. 138 f. above] that it is here that the anticathexis from the system *Cs.* comes most noticeably into the foreground. It is this which, organized as a reaction-formation, brings about the first repression, and which is later the point at which the repressed idea breaks through. We may venture the supposition that it is because of the predominance of the anticathexis and the absence of discharge that the work of repression seems far less successful in anxiety hysteria and in obsessional neurosis than in conversion hysteria.[1]

V. THE SPECIAL CHARACTERISTICS OF THE SYSTEM *UCS.*

[186] The distinction we have made between the two psychical systems receives fresh significance when we observe that processes in the one system, the *Ucs.*, show characteristics which are not met with again in the system immediately above it.

The nucleus of the *Ucs.* consists of drive representatives which seek to discharge their cathexis; that is to say, it consists of wishful impulses. These drive impulses are coordinate with one another, exist side by side without being influenced by one another, and are exempt from mutual contradiction. When two wishful impulses whose aims must appear to us incompatible become simultaneously active, the two impulses do not diminish each other or cancel each other out, but combine to form an intermediate aim, a compromise.

There are in this system no negation, no doubt, no degrees of certainty: all this is only introduced by the work of the censorship between the *Ucs.* and the *Pcs.* Negation is a substitute, at a higher level, for repression.[2] In the *Ucs.* there are only contents, cathected with greater or lesser strength.

1 [The topics in the present section were reconsidered by Freud in *Inhibitions, Symptoms and Anxiety* (1926*d*). See especially *RSE*, **20**, 112 ff., 126 *n.* 1 and 129–30.]

2 [This had already been asserted by Freud in Chapter VI of his book on *Jokes* (1905*c*), ibid., **8**. Cf., however, Freud's later discussion of negation (1925*h*), ibid., **19**, 237 ff.]

The cathectic intensities [in the *Ucs*.] are much more mobile. By the process of *displacement* one idea may surrender to another its whole quota of cathexis; by the process of *condensation* it may appropriate the whole cathexis of several other ideas. I have proposed to regard these two processes as distinguishing marks of the so-called *primary psychical process*. In the system *Pcs*. the *secondary process*[1] is dominant. When a primary process is allowed to take its course in connection with elements belonging to the system *Pcs*., it appears 'comic' and excites laughter.[2]

The processes of the system *Ucs*. are *timeless*[t]; i.e. they are not ordered [187]
temporally, are not altered by the passage of time; they have no reference to time at all. Reference to time is bound up, once again, with the work of the system *Cs*.[3]

The *Ucs*. processes pay just as little regard to *reality*. They are subject to the pleasure principle; their fate depends only on how strong they are and on whether they fulfil the demands of the pleasure–unpleasure regulation [*Lust–Unlustregulierung*][T].[4] *Lust*

To sum up: *exemption from mutual contradiction*, *primary process* (mobility of cathexes), *timelessness*, and *replacement of external with psychical reality* – these are the characteristics which we may expect to find in processes belonging to the system *Ucs*.[5]

1 Cf. the discussion in Chapter VII of *The Interpretation of Dreams* (1900*a*) [Section E; *RSE*, **5**, 526 ff.], based on ideas developed by Breuer in *Studies on Hysteria* (Breuer & Freud, 1895*d*). [A comment on Freud's attribution of these hypotheses to Breuer can be found in the Editors' Introduction to the latter work (ibid., **2**, xxv f.) and in a footnote to the same volume (ibid., 173 *n.* 1).]

2 [Freud had expressed this idea in very similar words in Chapter VII (E) of *The Interpretation of Dreams* (1900*a*), ibid., **5**, 542. The point is dealt with more fully in his book on *Jokes* (1905*c*), especially in the second and third sections of Chapter VII; ibid., **8**.]

3 [In the 1915 edition only, this read '*Pcs*.'. – Mentions of the 'timelessness' of the unconscious can be found scattered throughout Freud's writings. The earliest is perhaps a sentence dating from 1897 (Freud, 1950*a*, Draft M) in which he declares that 'neglect of the characteristic of time [is] no doubt essential for the distinction between activity in the preconscious and unconscious' (ibid., **1**, 280). See also a hint in 'The Aetiology of Hysteria' (1896*c*), ibid., **3**, 223. The point is indirectly alluded to in *The Interpretation of Dreams* (1900*a*), ibid., **5**, 517, but the first explicit published mention of it seems to have been in a footnote added in 1907 to *The Psychopathology of Everyday Life* (1901*b*), near the end of the last chapter (ibid., **6**, 235 f. *n.* 3). Another passing allusion occurs in a footnote to the paper on narcissism (above, p. 84 *n.* 1). Freud returned to the question more than once in his later writings: particularly in *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 28, and in Lecture XXXI of the *New Introductory Lectures* (1933*a*), ibid., **22**, 66. A discussion on the subject took place at a meeting of the Vienna Psychoanalytical Society on November 8, 1911, and the published minutes (*Zbl. Psychoan*., **2**, 476–7) give a very short summary of some remarks made by Freud on the occasion.]

4 [Cf. Section 8 of 'The Two Principles of Mental Functioning' (1911*b*), *RSE*, **12**. 'Reality-testing' is dealt with at some length in the next paper (p. 205 ff. below).]

5 We are reserving for a different context the mention of another notable privilege of the *Ucs*. [In a letter to Groddeck of June 5, 1917, Freud writes: 'In my essay on the *Ucs*. which you mention you will find an inconspicuous note: "We are reserving for a different context the mention of another notable privilege of the *Ucs*." I will divulge to you what this note refers to: the assertion that the *Ucs*. exerts on somatic processes an influence of far greater plastic power than the conscious act ever can.' (Freud, 1960*a*.)]

Unconscious processes only become cognizable by us under the conditions of dreaming and of neurosis – that is to say, when processes of the higher, *Pcs*., system are set back to an earlier stage by being lowered (by regression). In themselves they cannot be cognized, indeed are even incapable of carrying on their existence; for the system *Ucs*. is at a very early moment overlaid by the *Pcs*. which has taken over access to consciousness and to motility. Discharge from the system *Ucs*. passes into
[188] somatic innervation that leads to development of affect; but even this path of discharge is, as we have seen [p. 158 above], contested by the *Pcs*. By itself, the system *Ucs*. would not in normal conditions be able to bring about any expedient muscular acts, with the exception of those already organized as reflexes.

The full significance of the characteristics of the system *Ucs*. described above could only be appreciated by us if we were to contrast and compare them with those of the system *Pcs*. But this would take us so far afield that I propose that we should once more call a halt and not undertake the comparison of the two till we can do so in connection with our discussion of the higher system.[1] Only the most pressing points of all will be mentioned at this stage.

The processes of the system *Pcs*. display – no matter whether they are already conscious or only capable of becoming conscious – an inhibition of the tendency of cathected ideas towards discharge. When a process passes from one idea to another, the first idea retains a part of its cathexis and only a small portion undergoes displacement. Displacements and condensations such as happen in the primary process are excluded or very much restricted. This circumstance caused Breuer to assume the existence of two different states of cathectic energy in mental life: one in which the energy is tonically 'bound' and the other in which it is freely mobile and presses towards discharge.[2] In my opinion this distinction represents the deepest insight we have gained up to the present into the nature of nervous energy, and I do not see how we can avoid making it. A metapsychological presentation would most urgently call for further discussion at this point, though perhaps that would be too daring an undertaking as yet.

Further, it devolves upon the system *Pcs*. to make communication possible between the different ideational contents so that they can

1 [A probable reference to the lost paper on consciousness.]

2 [Cf. footnote 1, p. 165 above.]

influence one another, to give them an order in time,[1] and to set up a censorship or several censorships; 'reality-testing' too, and the reality principle, are in its province. Conscious memory, moreover, seems to depend wholly on the *Pcs*.[2] This should be clearly distinguished from the [189] memory traces in which the experiences of the *Ucs*. are fixed, and probably corresponds to a special registration such as we proposed (but later rejected) to account for the relation of conscious to unconscious ideas [p. 154 ff. above]. In this connection, also, we shall find means for putting an end to our oscillations in regard to the naming of the higher system – which we have hitherto spoken of indifferently, sometimes as the *Pcs*. and sometimes as the *Cs*.

Nor will it be out of place here to utter a warning against any overhasty generalization of what we have brought to light concerning the distribution of the various mental functions between the two systems. We are describing the state of affairs as it appears in the adult human being, in whom the system *Ucs*. operates, strictly speaking, only as a preliminary stage of the higher organization. The question of what the content and connections of that system are during the development of the individual, and of what significance it possesses in animals – these are points on which no conclusion can be deduced from our description: they must be investigated independently.[3] Moreover, in human beings we must be prepared to find possible pathological conditions under which the two systems alter, or even exchange, both their content and their characteristics.

VI. COMMUNICATION BETWEEN THE TWO SYSTEMS

It would nevertheless be wrong to imagine that the *Ucs*. remains at rest [190] while the whole work of the mind is performed by the *Pcs*. – that the *Ucs*. is something finished with, a vestigial organ, a residuum from the process of development. It is wrong also to suppose that communication between the two systems is confined to the act of repression, with the *Pcs*. casting everything that seems disturbing to it into the abyss of the *Ucs*. On the contrary, the *Ucs*. is alive and capable of development and maintains a number of other relations with the *Pcs*., among them that of cooperation. In brief, it must be said that the *Ucs*. is continued into what

1 [There is a hint at the mechanism by which the *Pcs*. effects this in the penultimate paragraph of Freud's paper on the 'Mystic Writing-Pad' (1925*a*), *RSE*, **19**, 231.]

2 [Cf. above, p. 84 *n*. 1. – In the 1915 edition only, this read '*Cs*.'.]

3 [One of the very few remarks made by Freud on the metapsychology of animals can be found in Chapter I of his *Outline of Psychoanalysis* (1940*a*), *RSE*, **23**, 133.]

are known as derivatives,[1] that it is accessible to the impressions of life, that it constantly influences the *Pcs*., and is even, for its part, subjected to influences from the *Pcs*.

Study of the derivatives of the *Ucs*. will completely disappoint our expectations of a schematically clear-cut distinction between the two psychical systems. This will no doubt give rise to dissatisfaction with our results and will probably be used to cast doubts on the value of the way in which we have divided up the psychical processes. Our answer is, however, that we have no other aim but that of translating into theory the results of observation, and we deny that there is any obligation on us to achieve at our first attempt a well-rounded theory which will commend itself by its simplicity. We shall defend the complications of our theory so long as we find that they meet the results of observation, and we shall not abandon our expectations of being led in the end by those very complications to the discovery of a state of affairs which, while simple in itself, can account for all the complications of reality.

Among the derivatives of the *Ucs*. drive impulses, of the sort we have described, there are some which unite in themselves characters of an opposite kind. On the one hand, they are highly organized, free from self-contradiction, have made use of every acquisition of the system *Cs*. and would hardly be distinguished in our judgement from the formations of that system. On the other hand, they are unconscious and are
[191] incapable of becoming conscious. Thus *qualitatively* they belong to the system *Pcs*., but *factually* to the *Ucs*. Their origin is what decides their fate. We may compare them with individuals of mixed race who, taken all round, resemble white men, but who betray their coloured descent by some striking feature or other, and on that account are excluded from society and enjoy none of the privileges of white people. Of such a nature
Phantasie, Bildung are those phantasies [*Phantasiebildungen*][T] of normal people as well as of neurotics which we have recognized as preliminary stages in the formation both of dreams and of symptoms and which, in spite of their high degree of organization, remain repressed and therefore cannot become conscious.[2] They draw near to consciousness and remain undisturbed so long as they do not have an intense cathexis, but as soon as they exceed a certain height of cathexis they are thrust back. Substitutive formations, too, are highly organized derivatives of the *Ucs*. of this kind; but these succeed in breaking through into consciousness, when circumstances

1 [See 'Repression', p. 131 f. above.]

2 [This question is elaborated in a footnote added in 1920 to Section 5 of the third of Freud's *Three Essays* (1905*d*), *RSE*, **7**, 199 f. *n*. 3.]

are favourable – for example, if they happen to join forces with an anticathexis from the *Pcs*.

When, elsewhere,[1] we come to examine more closely the preconditions for becoming conscious, we shall be able to find a solution to some of the difficulties that arise at this juncture. Here it seems a good plan to look at things from the angle of consciousness, in contrast to our previous approach, which was upwards from the *Ucs*. To consciousness the whole sum of psychical processes presents itself as the realm of the preconscious. A very great part of this preconscious originates in the unconscious, has the character of its derivatives and is subjected to a censorship before it can become conscious. Another part of the *Pcs*. is capable of becoming conscious without any censorship. Here we come upon a contradiction of an earlier assumption. In discussing the subject of repression we were obliged to place the censorship which is decisive for becoming conscious between the systems *Ucs*. and *Pcs*. [p. 153 above]. Now it becomes probable that there is a censorship between the *Pcs*. and the *Cs*.[2] Nevertheless, we shall do well not to regard this complication as [192]
a difficulty, but to assume that to every transition from one system to that immediately above it (that is, every advance to a higher stage of psychical organization) there corresponds a new censorship. This, it may be remarked, does away with the assumption of a continuous laying down of new registrations [p. 154].

The reason for all these difficulties is to be found in the circumstance that the attribute of being conscious, which is the only characteristic of psychical processes that is directly presented to us, is in no way suited to serve as a criterion for the differentiation of systems. [Cf. p. 153.] Apart from the fact that the conscious is not always conscious but also at times latent, observation has shown that much that shares the characteristics of the system *Pcs*. does not become conscious; and we learn in addition that the act of becoming conscious is dependent on the attention of the *Pcs*. being turned in certain directions.[3] Hence consciousness stands in no

1 [Another probable reference to the lost paper on consciousness.]

2 [See p. 153 above. The point had already been raised by Freud in Chapter VII (F) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 549 and 552. It is discussed at greater length below, p. 170 f.]

3 [Literally 'we learn in addition that becoming conscious is restricted by certain directions of its attention.' The 'its' almost certainly refers to the *Pcs*. This rather obscure sentence would probably be clearer if we possessed the lost paper on consciousness. The gap here is particularly tantalizing, as it seems likely that the reference is to a discussion of the function of 'attention' – a subject on which Freud's later writings throw very little light. There are two or three passages in *The Interpretation of Dreams* (1900*a*) which seem relevant in this connection: 'The excitatory processes occurring in [the preconscious] can enter consciousness without further impediment provided that certain other conditions are fulfilled: for instance . . . that the function which can

simple relation either to the different systems or to repression. The truth is that it is not only the psychically repressed that remains alien to consciousness, but also some of the impulses which dominate our ego [193] – something, therefore, that forms the strongest functional antithesis to the repressed. The more we seek to win our way to a metapsychological view of mental life, the more we must learn to emancipate ourselves from the importance of the symptom of 'being conscious'.[1]

So long as we still cling to this belief we see our generalizations regularly broken through by exceptions. On the one hand we find that derivatives of the *Ucs.*[2] become conscious as substitutive formations and symptoms – generally, it is true, after having undergone great distortion as compared with the unconscious, though often retaining many characteristics which call for repression. On the other hand, we find that many preconscious formations remain unconscious, though we should have expected that, from their nature, they might very well have become conscious. Probably in the latter case the stronger attraction of the *Ucs.* is asserting itself. We are led to look for the more important distinction as lying, not between the conscious and the preconscious, but between the preconscious and the unconscious. The *Ucs.* is turned back on the frontier of the *Pcs.* by the censorship, but derivatives of the *Ucs.* can circumvent this censorship, achieve a high degree of organization and reach a certain intensity of cathexis in the *Pcs.* When, however, this intensity is exceeded and they try to force themselves into consciousness, they are recognized as derivatives of the *Ucs.* and are repressed afresh at the new frontier of censorship, between the *Pcs.* and the *Cs.* Thus the first of these censorships is exercised against the *Ucs.* itself, and the second against its

only be described as "attention" is distributed in a particular way' (*RSE*, **5**, 483). 'Becoming conscious is connected with the application of a particular psychical function, that of attention' (ibid., 530). 'The system *Pcs.* not merely bars access to consciousness, it also . . . has at its disposal for distribution a mobile cathectic energy, a part of which is familiar to us in the form of attention' (ibid., 549). In contrast to the paucity of allusions to the subject in Freud's later writings, the 'Project' of 1895 treats of attention at great length and regards it as one of the principal forces at work in the mental apparatus (Freud, 1950*a*, especially Section 1 of Part III). He there (as well as in his paper on 'The Two Principles of Mental Functioning', 1911*b*) relates it in particular to the function of 'reality-testing', which is linked in turn with the concept of 'hypercathexis'. Cf. Freud's formulation in the 'Project': '*the biological rule of attention* runs: *If an indication of reality appears, then the perceptual cathexis which is simultaneously present is to be hypercathected.*' (*RSE*, **1**, 395.) The concept of hypercathexis reappears on pp. 171 and 173 below. See also the Editors' Note to 'A Metapsychological Supplement to the Theory of Dreams' (below, p. 196), where the relation of attention to the system *Pcpt.* is considered.]

1 [The complication discussed in this paragraph was reinforced by Freud in Chapter I of *The Ego and the Id* (1923*b*), *RSE*, **19**, 15, and in the following chapter he propounded his new structural picture of the mind, which so greatly simplified his whole description of its workings.]

2 [All the German editions prior to 1975 read '*Vbw*' (*Pcs.*). It seems probable that this is a misprint for '*Ubw*' (*Ucs.*). This is confirmed by an inspection of the manuscript.]

Pcs. derivatives. One might suppose that in the course of individual development the censorship had taken a step forward.

In psychoanalytic treatment the existence of the second censorship, located between the systems *Pcs.* and *Cs.*, is proved beyond question. We require the patient to form numerous derivatives of the *Ucs.*, we make him pledge himself to overcome the objections of the censorship to these preconscious formations becoming conscious, and by overthrowing *this* censorship, we open up the way to abrogating the [194]
repression accomplished by the *earlier* one. To this let us add that the existence of the censorship between the *Pcs.* and the *Cs.* teaches us that becoming conscious is no mere act of perception, but is probably also a *hypercathexis*,[1] a further advance in the psychical organization.

Let us turn to the communications between the *Ucs.* and the other systems, less in order to establish anything new than in order to avoid omitting what is most prominent. At the roots of drive activity the systems communicate with one another most extensively. One portion of the processes which are there excited passes through the *Ucs.*, as through a preparatory stage, and reaches the highest psychical development in the *Cs.*; another portion is retained as *Ucs.* But the *Ucs.* is also affected by experiences originating from external perception. Normally all the paths from perception to the *Ucs.* remain open, and only those leading on from the *Ucs.* are subject to blocking by repression.

It is a very remarkable thing that the *Ucs.* of one human being can react upon that of another, without passing through the *Cs.* This deserves closer investigation, especially with a view to finding out whether preconscious activity can be excluded as playing a part in it; but, descriptively speaking, the fact is incontestable. [Cf. an example of this in Freud, 1913*i*; *RSE*, **12**.]

The content of the system *Pcs.* (or *Cs.*) is derived partly from the drives (through the medium of the *Ucs.*), and partly from perception. It is doubtful how far the processes of this system can exert a direct influence on the *Ucs.*; examination of pathological cases often reveals an almost incredible independence and lack of susceptibility to influence on the part of the *Ucs.* A complete divergence of their trends, a total severance of the two systems, is what above all characterizes a condition of illness. Nevertheless, psychoanalytic treatment is based upon an influencing of the *Ucs.* from the direction of the *Cs.*, and at any rate shows that this, though a laborious task, is not impossible. The derivatives of the *Ucs.* which act as intermediaries between the two systems open the way, as we

1 [Cf. above, p. 169 *n.* 3 and below, p. 177 f.]

have already said [p. 171 above], towards accomplishing this. But we may safely assume that a spontaneously effected alteration in the *Ucs.* from the direction of the *Cs.* is a difficult and slow process.

[195] Cooperation between a preconscious and an unconscious impulse, even when the latter is intensely repressed, may come about if there is a situation in which the unconscious impulse can act in the same sense as one of the dominant trends. The repression is removed in this instance, and the repressed activity is admitted as a reinforcement of the one intended by the ego. The unconscious becomes ego-syntonic [*ichgerecht*][T] in respect of this single conjunction without any change taking place in its repression apart from this. In this cooperation the influence of the *Ucs.* is unmistakable: the reinforced tendencies reveal themselves as being nevertheless different from the normal; they make specially perfect functioning possible, and they manifest a resistance in the face of opposition which is similar to that offered, for instance, by obsessional symptoms.

The content of the *Ucs.* may be compared with an aboriginal population in the mind. If inherited mental formations [*Bildungen*] exist in the human being – something analogous to instinct [*Instinkt*][1] in animals – these constitute the nucleus of the *Ucs.* Later there is added to them what is discarded during childhood development as unserviceable; and this need not differ in its nature from what is inherited. A sharp and final division between the content of the two systems does not, as a rule, take place till puberty.

VII. ASSESSMENT OF THE UNCONSCIOUS

[196] What we have put together in the preceding discussions is probably as much as we can say about the *Ucs.* so long as we only draw upon our knowledge of dream life and the transference neuroses. It is certainly not much, and at some points it gives an impression of obscurity and confusion; and above all it offers us no possibility of coordinating or subsuming the *Ucs.* into any context with which we are already familiar. It is only the analysis of one of the affections which we call narcissistic psychoneuroses that promises to furnish us with conceptions [*Auffassungen*][T] through which the enigmatic *Ucs.* will be brought more within our reach and, as it were, made tangible.

1 [See *RSE*, **24**, 85–8, and Editors' Note to 'Drives and their Vicissitudes', p. 99 above. – The question of the inheritance of mental formations was to be discussed by Freud soon afterwards in Lecture XXIII of his *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 316 ff., and in his 'Wolf Man' case history (1918*b*), ibid., **17**, 87.]

Since the publication of a work by Abraham (1908) – which that conscientious author has attributed to my instigation – we have tried to base our characterization of Kraepelin's 'dementia praecox' (Bleuler's 'schizophrenia') on its position with reference to the antithesis between ego and object. In the transference neuroses (anxiety hysteria, conversion hysteria and obsessional neurosis) there was nothing to give special prominence to this antithesis. We knew, indeed, that frustration in regard to the object brings on the outbreak of the neurosis and that the neurosis involves a renunciation of the real object; we knew too that the libido that is withdrawn from the real object reverts first to a phantasied object and then to one that had been repressed (introversion).[1] But in these disorders object cathexis in general is retained with great energy, and more detailed examination of the process of repression has obliged us to assume that object cathexis persists in the system *Ucs*. in spite of – or rather in consequence of – repression. [Cf. p. 131 f. above.] Indeed, the capacity for transference, of which we make use for therapeutic purposes in these affections, presupposes an unimpaired object cathexis.

In the case of schizophrenia, on the other hand, we have been driven to the assumption that after the process of repression the libido that has been withdrawn does not seek a new object, but retreats into the ego; that is to say, that here the object cathexes are given up and a primitive [197]
objectless condition of narcissism is re-established. The incapacity of these patients for transference (so far as the pathological process extends), their consequent inaccessibility to therapeutic efforts, their characteristic repudiation of the external world, the appearance of signs of a hypercathexis of their own ego, the final outcome in complete apathy – all these clinical features seem to agree excellently with the assumption that their object cathexes have been given up. As regards the relation of the two psychical systems to each other, all observers have been struck by the fact that in schizophrenia a great deal is expressed as being conscious which in the transference neuroses can only be shown to be present in the *Ucs*. by psychoanalysis. But to begin with we were not able to establish any intelligible connection between the ego–object relation and the relationships of consciousness.

What we are seeking seems to present itself in the following unexpected way. In schizophrenics we observe – especially in the initial stages, which are so instructive – a number of changes in *speech*, some of which deserve to be regarded from a particular point of view. The patient often

1 [The process is described in detail in Section (*a*) of Freud's paper on 'Types of Onset of Neurosis' (1912*c*), *RSE*, **12**, 227 ff.]

devotes peculiar care to his way of expressing himself, which becomes 'stilted' and 'precious'. The construction of his sentences undergoes a peculiar disorganization, making them so incomprehensible to us that his remarks seem nonsensical. Some reference to bodily organs or innervations is often given prominence in the content of these remarks. To this may be added the fact that in such symptoms of schizophrenia as are comparable with the substitutive formations of hysteria or obsessional neurosis, the relation between the substitute and the repressed material nevertheless displays peculiarities which would surprise us in these two forms of neurosis.

Dr Victor Tausk of Vienna has placed at my disposal some observations that he has made in the initial stages of schizophrenia in a female patient, which are particularly valuable in that the patient was ready to explain her utterances herself.[1] I will take two of his examples to illustrate the view I wish to put forward, and I have no doubt that every observer could easily produce plenty of such material.

[198] A patient of Tausk's, a girl who was brought to the clinic after a quarrel with her lover, complained that *her eyes were not right, they were twisted*. This she herself explained by bringing forward a series of reproaches against her lover in coherent language. 'She could not understand him at all, he looked different every time; he was a hypocrite, an eye-twister,[2] he had twisted her eyes; now she had twisted eyes; they were not her eyes any more; now she saw the world with different eyes.'

The patient's comments on her unintelligible remark have the value of an analysis, for they contain the equivalent of the remark expressed in a generally comprehensible form. They throw light at the same time on the meaning and the genesis of schizophrenic word formation. I agree with Tausk in stressing in this example the point that the patient's relation to a bodily organ (the eye) has arrogated to itself the representation of the whole content [of her thoughts]. Here the schizophrenic utterance exhibits a hypochondriac trait: it has become '*organ speech*'.[3]

A second communication by the same patient was as follows: 'She was standing in church. Suddenly she felt a jerk; she had to *change her position, as though somebody was putting her into a position, as though she was being put in a certain position*.'

Now came the analysis of this through a fresh series of reproaches against her lover. 'He was common, he had made her common, too, though she was naturally refined. He had made her like himself by

1 [A paper referring to the same patient was later published by Tausk (1919).]

2 [The German '*Augenverdreher*' has the figurative meaning of 'deceiver'.]

3 [Cf. Freud's discussion of hypochondria in his paper on narcissism (1914*c*), above, p. 72 ff.]

making her think that he was superior to her; now she had become like him, because she thought she would be better if she were like him. He had *given a false impression of his position*; now she was just like him' (by identification), 'he had *put her in a false position*.'

The physical movement of 'changing her position', Tausk remarks, depicted the words 'putting her in a false position' and her identification with her lover. I would call attention once more to the fact that the whole train of thought is dominated by the element which has for its content a bodily innervation (or, rather, the sensation of it). Furthermore, a hysterical woman would, in the first example, have *in fact* convulsively twisted her eyes, and, in the second, have given actual jerks, instead of [199]
having the *impulse* to do so or the *sensation* of doing so: and in neither example would she have any accompanying conscious thoughts, nor would she have been able to express any such thoughts afterwards.

These two observations, then, argue in favour of what we have called hypochondriacal speech or 'organ speech'. But, what seems to us more important, they also point to something else, of which we have innumerable instances (for example, in the cases collected in Bleuler's monograph [1911]) and which may be reduced to a definite formula. In schizophrenia *words* are subjected to the same process as that which makes the dream images out of latent dream thoughts – to what we have called the primary psychical process. They undergo condensation, and by means of displacement transfer their cathexes to one another in their entirety. The process may go so far that a single word, if it is specially suitable on account of its numerous connections, takes over the representation of a whole train of thought.[1] The works of Bleuler, Jung and their pupils offer a quantity of material which particularly supports this assertion.[2]

Before we draw any conclusion from impressions such as these, let us consider further the distinctions between the formation of substitutes in schizophrenia on the one hand, and in hysteria and obsessional neurosis on the other – subtle distinctions which nevertheless make a strange impression. A patient whom I have at present under observation[3] has

1 [*The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 532.]

2 The dream-work, too, occasionally treats words like things, and so creates very similar 'schizophrenic' utterances or neologisms. [See *The Interpretation of Dreams* (1900*a*), ibid., **4**, 263 ff. A distinction between what happens in dreams and in schizophrenia is drawn, however, in 'A Metapsychological Supplement to the Theory of Dreams', p. 203 below.]

3 [It is uncertain that this refers to the 'Wolf Man', despite the striking similarity, as his treatment ended in July, 1914, and Freud did not see him again until the spring of 1919. The obsession with the skin of his nose which came to prominence in February, 1924, had, however, already made an appearance during his first analysis with Freud and prompted him to consult a leading dermatologist in Vienna (Brunswick, 1928*a*).]

allowed himself to be withdrawn from all the interests of life on account of a bad condition of the skin of his face. He declares that he has blackheads and deep holes in his face which everyone notices. Analysis shows that he is playing out his castration complex upon his skin. At first he worked at these blackheads remorselessly; and it gave him great satisfaction to squeeze them out, because, as he said, something spurted out when he did so. Then he began to think that a deep cavity appeared wherever he had got rid of a blackhead, and he reproached himself most
[200] vehemently with having ruined his skin for ever by 'constantly fiddling about with his hand'. Pressing out the content of the blackheads is clearly to him a substitute for masturbation. The cavity which then appears owing to his fault is the female genital, i.e. the fulfilment of the threat of castration (or the phantasy representing that threat) provoked by his masturbating. This substitutive formation has, in spite of its hypochondriacal character, considerable resemblance to a hysterical conversion; and yet we have a feeling that something different must be going on here, that a substitutive formation such as this cannot be attributed to hysteria, even before we can say in what the difference consists. A tiny little cavity such as a pore of the skin would hardly be used by a hysteric as a symbol for the vagina, which he is otherwise ready to compare with every imaginable object that encloses a hollow space. Besides, we should expect the multiplicity of these little cavities to prevent him from using them as a substitute for the female genital. The same applies to the case of a young patient reported by Tausk some years ago to the Vienna Psychoanalytical Society. This patient behaved in other respects exactly as though he were suffering from an obsessional neurosis; he took hours to wash and dress, and so on. It was noticeable, however, that he was able to give the meaning of his inhibitions without any resistance. In putting on his stockings, for instance, he was disturbed by the idea that he must pull apart the stitches in the knitting, i.e. the holes, and to him every hole was a symbol of the female genital aperture. This again is a thing which we cannot attribute to an obsessional neurotic. Reitler observed a patient of the latter sort, who also suffered from having to take a long time over putting on his stockings; this man, after overcoming his resistances, found as the explanation that his foot symbolized a penis, that putting on the stocking stood for a masturbatory act, and that he had to keep on pulling the stocking on and off, partly in order to complete the picture of masturbation, and partly in order to undo that act.

If we ask ourselves what it is that gives the character of strangeness to the substitutive formation and the symptom in schizophrenia, we

eventually come to realize that it is the predominance of what has to do with words over what has to do with things. As far as the thing goes, there is only a very slight similarity between squeezing out a blackhead and an emission from the penis, and still less similarity between the innumerable shallow pores of the skin and the vagina; but in the former case [201]
there is, in both instances, a 'spurting out', while in the latter the cynical saying, 'a hole is a hole', is true verbally. What has dictated the substitution is not the resemblance between the things denoted but the sameness of the words used to express them. Where the two – word and thing – do not coincide, the formation of substitutes in schizophrenia deviates from that in the transference neuroses.

If now we put this finding alongside the hypothesis that in schizophrenia object cathexes are given up, we shall be obliged to modify the hypothesis by adding that the cathexis of the *word* presentations [*Wortvorstellungen*][T] of objects is retained. What we have permissibly called the conscious presentation[I] of the object can now be split up into the presentation of the *word* and the presentation of the *thing* [*Sachvorstellung*]; the latter consists in the cathexis, if not of the direct memory images of the thing, at least of remoter memory traces derived from these. We now seem to know all at once what the difference is between a conscious and an unconscious presentation [see p. 156 above]. The two are not, as we supposed, different registrations of the same content in different psychical localities, nor yet different functional states of cathexis in the same locality; but the conscious presentation comprises the presentation of the thing plus the presentation of the word belonging to it, while the unconscious presentation is the presentation of the thing alone. The system *Ucs*. contains the thing cathexes of the objects, the first and true object cathexes; the system *Pcs*. comes about by this [202]
thing presentation being hypercathected through being linked with the word presentations corresponding to it. It is these hypercathexes, we may suppose, that bring about a higher psychical organization and make

1 ['*Vorstellung*.' This word has as a rule been translated above by 'idea'. (See footnote 2, p. 154.) From this point till the end of the paper, '*Vorstellung*' is uniformly translated by 'presentation' – '*Wortvorstellung*' 'presentation of the word' or 'word presentation'; '*Sachvorstellung*' 'presentation of the thing' or 'thing presentation'. These words were formerly translated by the somewhat misleading 'verbal idea' and 'concrete idea'. In 'Mourning and Melancholia' (below, p. 228) Freud replaced '*Sachvorstellung*' with the synonymous '*Dingvorstellung*'; and he had used this second version earlier, in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 263, and near the beginning of Chapter IV of his book on *Jokes* (1905*c*), ibid., **8**, 105. – The distinction between 'word presentations' and 'thing presentations' was already in his mind when he wrote these earlier works, and it no doubt derives from his studies on the aphasias. The matter was discussed at some length in his monograph on the subject (1891*b*), *NSW*, **4**, though in somewhat different terminology. The relevant passage in that work has been translated below in Appendix C (p. 186 ff.). For a discussion of the translation of '*Vorstellung*', see *RSE*, **24**, 94–8.]

it possible for the primary process to be succeeded by the secondary process which is dominant in the *Pcs*. Now, too, we are in a position to state precisely what it is that repression denies to the rejected presentation in the transference neuroses [p. 159 f. above]: what it denies to the presentation is translation [*Übersetzung*][T] into words which shall remain attached to the object. A presentation which is not put into words, or a psychical act which is not hypercathected, remains thereafter in the *Ucs*. in a state of repression.

I should like to point out at what an early date we already possessed the insight which today enables us to understand one of the most striking characteristics of schizophrenia. In the last few pages of *The Interpretation of Dreams*, which was published in 1900, the view was developed that thought processes, i.e. those acts of cathexis which are comparatively remote from perception, are in themselves without quality and unconscious, and that they attain their capacity to become conscious only through being linked with the residues of perceptions of *words*.[1] But word presentations, for their part too, are derived from sense perceptions, in the same way as thing presentations are; the question might therefore be raised why presentations of objects cannot become conscious through the medium of their *own* perceptual residues. Probably, however, thought proceeds in systems so far remote from the original perceptual residues that they have no longer retained anything of the qualities of those residues, and, in order to become conscious, need to be reinforced by new qualities. Moreover, by being linked with words, cathexes can be provided with quality even when they represent only *relations* between presentations of objects and are thus unable to derive any quality from perceptions. Such relations, which become comprehensible only through words, form a major part of our thought
[203] processes. As we can see, being linked with word presentations is not yet the same thing as becoming conscious, but only makes it possible to become so; it is therefore characteristic of the system *Pcs*. and of that system alone.[2] With these discussions, however, we have evidently departed from our subject proper and find ourselves plunged into

1 [*The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 551 f. See also ibid., **5**, 514. This hypothesis had, in fact, been put forward (though not published) by Freud even earlier, in his 'Project' of 1895 (1950*a*, towards the beginning of Section 1 of Part III). It had also been mentioned by him more recently, in his paper on 'The Two Principles of Mental Functioning' (1911*b*), ibid., **12**, 218.]

2 [Freud took up this subject again at the beginning of Chapter II of *The Ego and the Id* (1923*b*), ibid., **19**, 16 f.]

problems concerning the preconscious and the conscious, which for good reasons we are reserving for separate treatment.[1]

As regards schizophrenia, which we only touch on here so far as seems indispensable for a general understanding of the *Ucs*., a doubt must occur to us whether the process here termed repression has anything at all in common with the repression which takes place in the transference neuroses. The formula that repression is a process which occurs between the systems *Ucs*. and *Pcs*. (or *Cs*.), and results in keeping something at a distance from consciousness [p. 130 above], must in any event be modified, in order that it may also be able to include the case of dementia praecox and other narcissistic affections. But the ego's attempt at flight, which expresses itself in the withdrawal of the conscious cathexis, nevertheless remains a factor common [to the two classes of neurosis]. The most superficial reflection shows us how much more radically and profoundly this attempt at flight, this flight of the ego, is put into operation in the narcissistic neuroses.

If, in schizophrenia, this flight consists in withdrawal of drive cathexis from the points which represent the *unconscious* presentation of the object, it may seem strange that the part of the presentation of this object which belongs to the system *Pcs*. – namely, the word presentations corresponding to it – should, on the contrary, receive a more intense cathexis. We might rather expect that the word presentation, being the preconscious part, would have to sustain the first impact of repression and that it would be totally uncathectable after repression had proceeded as far as the unconscious thing presentations. This, it is true, is difficult to understand. It turns out that the cathexis of the word presentation is not part of the act of repression, but represents the first of the attempts at recovery or cure which so conspicuously dominate the clinical picture of schizophrenia.[2] These endeavours are directed [204]
towards regaining the lost object, and it may well be that to achieve this purpose they set off on a path that leads to the object via the verbal part of it, but then find themselves obliged to be content with words instead of things. It is a general truth that our mental activity moves in two opposite directions: either it starts from the drives and passes through the system *Ucs*. to conscious thought activity; or, beginning with an instigation from outside, it passes through the system *Cs*. and *Pcs*. till it reaches the *Ucs*. cathexes of the ego and objects. This second path must,

1 [This seems likely to be another reference to the unpublished paper on consciousness. See, however, below, p. 206.]

2 [See Part III of Freud's Schreber analysis (1911*c*), *RSE*, **12**, 51 ff. – A further schizophrenic attempt at recovery is mentioned below, p. 204.]

in spite of the repression which has taken place, remain traversable, and it lies open to some extent to the endeavours made by the neurosis to regain its objects. When we think in abstractions there is a danger that we may neglect the relations of words to unconscious thing presentations, and it must be confessed that the expression and content of our philosophizing then begins to acquire an unwelcome resemblance to the mode of operation of schizophrenics.[1] We may, on the other hand, attempt a characterization of the schizophrenic's mode of thought by saying that he treats concrete things as though they were abstract.

If we have made a true assessment of the nature of the *Ucs*. and have correctly defined the difference between an unconscious and a preconscious presentation, then our researches will inevitably bring us back from many other points to this same piece of insight.

1 [Freud had already made this point at the end of the second essay in *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 73 f.]

APPENDIX A

FREUD AND EWALD HERING

Among Freud's seniors in Vienna was the physiologist Ewald Hering (1834–1918), who, as we learn from Ernest Jones (1953, 244), offered the young man a post as his assistant at Prague; this was probably while Freud was still working at Brücke's Physiological Institute, most likely in 1882. Hering went to Prague as Professor Ordinarius in 1870. An episode some forty years later seems to suggest, as Ernst Kris (1956) pointed out, that Hering's influence may have contributed to Freud's views on the unconscious. (Cf. above, p. 144.)[1] In 1880 Samuel Butler published his *Unconscious Memory*. This included a translation of a lecture delivered by Hering in 1870, 'Über das Gedächtnis als eine allgemeine Funktion der organisierten Materie' ('On Memory as a Universal Function of Organized Matter'), with which Butler found himself in general agreement. A book with the title *The Unconscious*, by Israel Levine, was published in England in 1923; and a German translation of it by Anna Freud appeared in 1926. One section of it, however (Part I, Section 13), which deals with Samuel Butler, was translated by Freud himself. The author, Levine, though he mentioned Hering's lecture, was more concerned with Butler than with Hering, and in that connection (on page 34 of the German translation) Freud added a footnote as follows: [205]

'German readers, familiar with this lecture of Hering's and regarding it as a masterpiece, would not, of course, be inclined to bring into the foreground the considerations based on it by Butler. Moreover, some pertinent remarks are to be found in Hering which allow psychology the right to assume the existence of unconscious mental activity: "Who could hope to disentangle the fabric of our inner life with its thousandfold complexities, if we were willing to pursue its threads only so far as they traverse consciousness? . . . Chains such as these of unconscious material nerve processes, which end in a link accompanied by a conscious perception, have been described as 'unconscious trains of ideas' and 'unconscious inferences'; and from the standpoint of psychology this can be justified. For the mind would often slip through the fingers

1 [In *Beyond the Pleasure Principle* (1920g), *RSE*, **18**, another reference to Ewald Hering suggests that his ideas may also have contributed to Freud's theory of the dualistic classification of the drives.]

of psychology, if psychology refused to keep a hold on the mind's unconscious states." [Hering, 1870, 11 and 13.]'[1]

1 [Curiously in Butler's translation of the last sentences in this passage from Hering's lecture, he substituted the word 'psychology' with 'physiology'.]

APPENDIX B

PSYCHOPHYSICAL PARALLELISM

It has been pointed out above (p. 144) that Freud's earlier views on the relation between the mind and the nervous system were greatly influenced by Hughlings Jackson. This is particularly shown by the following passage extracted from his monograph on aphasia (1891*b*, 56–8; *NSW*, **4**, Chapter V). It is especially instructive to compare the last sentences on the subject of latent memories with Freud's later position (p. 148 above). In order to preserve a uniform terminology with the present edition, and consistency with the standard edition of Freud's *Complete Neuroscientific Works*, a new translation has been made by Mark Solms. [206]

After this digression we return to the conceptualization of aphasia. We remember that the assumption has evolved on the basis of Meynert's teachings that the language apparatus consists of distinct cortical centres, the cells of which contain the word presentations, and that these centres are separated by functionless cortical regions, linked by white fibres (association bundles). The question may at once be raised whether an assumption of this kind – which captures ideas in cells – is at all correct and permissible. I believe not.

In comparison with the tendency of earlier periods in medicine to localize whole mental faculties, as they are defined by psychological nomenclature, in specific territories of the brain, it must have appeared as a great advance when Wernicke declared that only the simplest psychical elements – the different sensory presentations – could legitimately be localized in the cortex, at the central terminations of the nerves from the periphery where the [sensory] impressions were received. Fundamentally, however, does one not make the same mistake in principle if one attempts to localize now a complicated concept and whole mental faculty, and now a psychical element? Is it justifiable to take a nerve fibre, which over the whole length of its course has been only a physiological structure and subject to physiological modifications, and to immerse its end in the psychical and to furnish this end with a presentation or a mnemic image? If 'will' and 'intelligence', and so on, are recognized as being psychological technical terms to [207]

which very complicated states of affairs correspond in the physiological world, can we be any more sure that a 'simple sensory presentation' is anything other than a technical term of that kind?

It is probable that the chain of physiological events in the nervous system does not stand in a causal relation to the psychical events. The physiological processes do not cease as soon as the psychical ones begin; rather the physiological chain continues, but each of its links (or some links) correspond to a psychical phenomenon from a certain moment. The psychical is, accordingly, a process parallel to the physiological ('a dependent concomitant'[1]).

I am well aware that I cannot accuse the people whose views I am here disputing of having executed this leap and this change in their scientific vantage point [i.e. from the physiological to the psychological] without consideration. They obviously mean nothing else than that the (physiological) modification of the nerve fibres which accompanies sensory stimulation produces another modification in the central nerve cell, which then becomes the physiological correlate of the 'idea'. Since they can say a great deal more about ideas than about the modifications, the physiology of which is still uncharacterized and unknown, they rely upon the elliptical statement: an idea is localized in the nerve cell. Yet this substitution at once leads to a confusion between the two things which need have no resemblance to each other. In psychology the simple idea is something elementary for us, which we can sharply distinguish from its connections with other ideas. This leads us to suppose that its physiological correlate – i.e. the modification of the nerve cells which originates from the stimulation of the nerve fibres – is something simple too, which can be localized at a particular point. Such an equation [*Übertragung*] is, of course, entirely unjustifiable; the properties of this modification must be established on their own account and independently of their psychological counterpart.[2]

1 [In English in the original. The phrase evidently refers to Hughlings Jackson's 'doctrine of concomitance', but the words 'a *dependent* concomitant' appear nowhere in his writings. Indeed, he specifically disavowed such a relation; Jackson spoke only of *correlations* between psychical and physiological events. See footnote 2 below.]

2 Hughlings Jackson has given the most emphatic warning against confusions of this kind between the physical and the psychical in the process of language: 'In all our studies of diseases of the nervous system we must be on our guard against the fallacy that what are physical states in lower centres fine away *into* psychical states in higher centres; that, for example, vibrations of sensory nerves *become* sensations, or that somehow or another an idea produces a movement.' (1878–9, 306.)

What then is the physiological correlate of the simple idea or its recurrence? Obviously nothing static, but something in the nature of a process. This process admits of localization. It proceeds from a particular point in the cortex and spreads from there over the whole cortex or along certain pathways. When this process is completed, it leaves a modification behind in the cortex that has been affected by it – the possibility of a memory. It is also highly doubtful whether anything psychical corresponds to this modification. Our consciousness contains nothing of the sort that would justify the term 'latent mnemic image' from the psychical point of view. But whenever the same state of the cortex is activated again, the psychical state comes into being once more as a memory. . . . [208]

APPENDIX C

WORDS AND THINGS

[209] The final section of Freud's paper on 'The Unconscious' seems to have roots in his early monograph on aphasia (1891*b*), *NSW*, **4**, Chapter VI. It may be of interest, therefore, to reproduce here a passage from that work which, though not particularly easy to follow in itself, nevertheless throws light on the assumptions that underlay some of Freud's later views. The passage has the further incidental interest of presenting Freud in the very unusual position of talking in the technical language of the 'academic' psychology of the later nineteenth century. The passage here quoted follows after a train of destructive and constructive anatomical and physiological argument which has led Freud to a hypothetical scheme of neurological functioning which he describes as the 'language apparatus' [*Sprachapparat*]. It must be noted, however, that there is an important and perhaps confusing difference between the terminology Freud uses here and in 'The Unconscious'. What he here calls the 'object presentation' [*Objektvorstellung*] is what in 'The Unconscious' he calls the 'thing presentation' [*Sachvorstellung*]; while what in 'The Unconscious' he calls the 'object presentation' denotes a complex made up of the combined 'thing presentation' and 'word presentation' [*Wortvorstellung*] – a complex which has no name given to it in the *Aphasia* passage. The translation is a new one (by Mark Solms) in order to make it consistent with the standard edition of Freud's *Complete Neuroscientific Works*, which is also consistent with the *RSE*. As in the last section of 'The Unconscious', we have here always used the word 'presentation' to render the German '*Vorstellung*', while 'image' stands for the German '*Bild*'. The passage runs from p. 74 to p. 81 of the original German edition.

We now propose to consider what assumptions are required to explain disorders of language on the basis of a language apparatus organized in this manner – in other words, what the study of disorders of language teaches us about the function of this apparatus. In doing so we shall keep the psychological and anatomical sides of the question as separate as possible.

[210] In psychology the unit of the function of language is the 'word', a complex presentation, which proves to be a combination put together from auditory, visual and kinaesthetic elements. We owe our knowledge of this combination to pathology, which shows us that in organic lesions of the language apparatus a disintegration of language takes place along

the lines on which the combination is put together. We shall thus expect to find that the loss of one of these elements of the word presentation will prove to be the most important indication for enabling us to arrive at a localization of the disease. Four components of the word presentation are usually distinguished: the 'sound image', the 'visual letter image', the 'motor speech image' and the 'motor writing image'. This combination, however, turns out to be more complicated when one enters into the probable process of association that takes place in each of the various activities of language:

(1) We learn to *speak* by associating a '*word sound image*' with a '*word innervation feeling* [*Wortinnervationsgefühl*]'.[1] After we have spoken, we are also in possession of a 'speech movement presentation' (centripetal sensations from the organs of speech); so that, in a motor respect, the 'word' is doubly determined for us. Of the two determining elements, the first – the innervatory word presentation – seems to have the least value from a psychological point of view; indeed its appearance at all as a psychical factor may be disputed. In addition to this, after speaking, we receive a 'sound image' of the spoken word. So long as we have not developed our power of speech very far, this second sound image need not be the same as the first one [the one imitated], but only associated with it.[2] At this stage (of language development in childhood) we make use of a language constructed by ourselves; we thereby behave like motor aphasiacs, for we associate a variety of alien word sounds with a single one produced by ourselves.

(2) We learn the language of others by endeavouring to make the sound [211]
image produced by ourselves as like as possible to the one which prompted our speech innervation. We learn in this way to '*repeat*'. When we concatenate words in '*connected speech*', we hold back the innervation of the next word till the sound image or the speech movement presentation (or both) of the preceding word has reached us. The security of our language is thus overdetermined,[3] and can easily stand the loss of one or the other of the determining factors. Nevertheless, a loss of the

1 ['It was once supposed that actively initiated movements involved a peculiar sort of sensation connected directly with the discharge of nervous impulses from the motor areas of the brain to the muscles. . . . The existence of this "innervation sense", or sense of energy put forth, is now generally denied.' (Stout, 1938, 258.) This last remark is confirmed by Freud a few lines lower down.]

2 [The second sound image is the sound image of the word spoken by ourselves, and the first one is that of the word we are imitating (the sound image mentioned at the beginning of the paragraph).]

3 [In German '*überbestimmt*'. The synonymous term '*überdeterminiert*' is the one used so frequently in Freud's later writings to express the notion of multiple causation. Cf. *RSE*, **2**, 189 *n.* 1.]

correction exercised by the second sound image and by the speech movement image explains some of the peculiarities of paraphasia, both physiological and pathological.

(3) We learn to *spell* by linking the visual images of the letters with new sound images, which, for their part, must remind us of word sounds which we already know. We at once 'repeat' the sound image that denotes the letter; so that letters, too, are seen to be determined by two sound images which coincide, and two motor presentations which correspond to each other.

(4) We learn to *read* by linking up in accordance with certain rules the succession of word innervation and word movement presentations which we receive when we enunciate individual letters, so that new motor word presentations arise. As soon as we have spoken these aloud, we discover from the sound images of these new word presentations that the two word movement and word sound images that we have received in this way have long been familiar to us and are identical to those used in speaking. Next we associate the meaning that was attached to the primary word sounds with the speech images which have been acquired by spelling. We now read with comprehension. If what we spoke primarily was a dialect and not a literary language, the word movement images and sound images of the words acquired through spelling have to be super-associated with the old images, and thus we have to learn a new language – a task which is facilitated by the similarity between the dialect and the literary language.

It will be seen from this account of learning to read that it is a very
[212] complicated process, in which the direction of the associations must repeatedly shift to and fro. We shall also be prepared to find that disorders of reading in aphasia are bound to occur in a great variety of ways. The only thing that decisively indicates a lesion in the visual element of reading is a disturbance in the *reading of individual letters*. The *combination* of letters into a word takes place during the transference [*Übertragung*] to the speech pathway and will thus be abolished in motor aphasia. The comprehension of what is read is arrived at only through the medium of the sound images generated by the words that have been spoken, or through the medium of the word movement images that arose in speaking. It is therefore seen to be a function that is extinguished not only where there are motor lesions, but also where there are auditory ones. Furthermore, comprehension of what is read is thus seen to be a function independent of the act of reading. Anyone can discover from self-observation that there are several kinds of reading, some of which

proceed without comprehension of what is read. When I am proof reading with a view to paying special attention to the visual images of the letters and other typographical signs, the sense of what I read escapes me so completely that I have to read the proofs again specially if I want to correct the style. When, on the other hand, I am reading a book that interests me, a novel for instance, I overlook all the misprints; and it may happen that I retain nothing more than some confused feature of the names of the characters in it – a recollection, perhaps, that they are long or short, or contain some unusual letter, such as an 'x' or a 'z'. When I have to read aloud, and have to pay particular attention to the sound images of my words and the intervals between them, I am once more in danger of concerning myself too little with the meaning of the words; and as soon as I get tired I read in such a way that, though other people can still comprehend what I am reading, I myself no longer know what I have read. These are phenomena of divided attention, which arise here precisely because comprehension of what is read only comes about in such a very circuitous way. If the process of reading itself offers difficulties, there is no longer any question of comprehension, as is made clear by analogy with our behaviour when we are learning to read; and we must be careful not to regard the absence of comprehension as evidence of the interruption of a [fibre] pathway. Reading aloud is not to be regarded as a process in any way different from reading to oneself, apart from the fact that it helps to divert attention from the sensory part of the process of reading. [213]

(5) We learn to *write* by reproducing the visual images of the letters by means of innervatory images of the hand, till the same or similar visual images appear. As a rule, the writing images are only similar to, and super-associated with, the reading images, since what we learn to read is *print* and what we learn to write is *script*. Writing proves to be a comparatively simple process and one that is not so easily disturbed as reading.

(6) It is to be assumed that later on, too, we carry out these various functions of language along the same associative paths as those along which we learnt them. At this later stage, abbreviations and substitutions may occur, but it is not always easy to say what their nature is. Their importance is diminished by the consideration that in cases of organic lesion the language apparatus as a whole will probably be damaged to some extent and be compelled to return to the modes of association which are primary, more secure and more ponderous. As regards reading, the '*visual word image*' undoubtedly makes its influence felt with

proficient readers, so that individual words (particularly proper names) can be read even without spelling them.

A word is thus a complex presentation consisting of the images enumerated above; or, to put it another way, there corresponds to the word an advanced associative process into which the elements of visual, auditory and kinaesthetic origin enumerated above enter together.

A word, however, acquires its *meaning* by being linked to an 'object presentation',[1] at all events if we restrict ourselves to a consideration of nouns. The object presentation itself is once again a complex of associations made up of the greatest variety of visual, auditory, tactile, kinaesthetic and other presentations. Philosophy tells us that an object presentation consists in nothing more than this – that the appearance of there being a 'thing' [*Dinges*] to whose various 'attributes' these sense impressions bear witness is merely due to the fact that, in enumerating the sense impressions which we have received from an object, we also assume the possibility of there being a large number of further
[214] impressions in the same chain of associations (J. S. Mill).[2] The object presentation is thus seen to be one which is not closed and barely capable of being closed, while the word presentation is seen to be something closed, even though capable of extension.

The pathology of disorders of language leads us to assert that *the word presentation is linked at its sensory end (by its sound images) with the object presentation*. We thus arrive at the existence of two classes of language disorder: (1) an aphasia of the first order, *verbal aphasia*, in which only the associations between the separate elements of the word presentation are disturbed; and (2) an aphasia of the second order, *asymbolic aphasia*, in which the association between the word and the object presentation is disturbed.

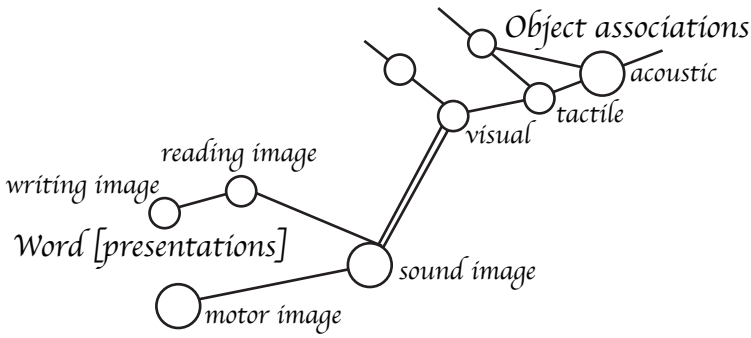
I use the term 'asymbolia' in a sense other than that in which it has ordinarily been used since Finkelnburg,[3] because the relation between the word [presentation] and object presentation, rather than that between the object and object presentation, seems to me to deserve
[215] to be described as a 'symbolic' one. For disturbances in the recognition of concrete objects [*Gegenständen*], which Finkelnburg classes as

1 ['*Objektvorstellung*.' – The 'thing presentation' (*Sachvorstellung*) of the paper on 'The Unconscious' (p. 177 ff. above).]

2 Cf. J. S. Mill, *A System of Logic* (1843), **1**, Book I, Chapter III, also *An Examination of Sir William Hamilton's Philosophy* (1865).

3 Quoted by Spamer (1876). [The term was introduced by Finkelnburg (1870).]

asymbolia, I should like to propose the term '*agnosia*'.[1] It is possible that 'agnostic' disturbances (which can only occur in cases of bilateral and extensive cortical lesions) may also entail a disorder of language, since all impetus [*Anregungen*] to spontaneous speech arises from the field of object associations. I should call such language disorders *aphasias of the third order* or *agnostic aphasias*. Clinical experience has in fact brought to our knowledge a few cases which call for this conception. . . .



PSYCHOLOGICAL DIAGRAM OF THE WORD PRESENTATION

The word presentation is shown as a closed complex of presentations, whereas the object presentation is shown as an open one. The word presentation is not linked to the object presentation by *all* its constituent elements, but only by its sound image. Among the object associations, it is the visual ones which stand for the object, in the same way as the sound image stands for the word. The connections linking the word sound image with object associations other than the visual ones are not indicated.

1 [This proposal was generally accepted in neurology, and the term 'agnosia' remains in current usage.]

A METAPSYCHOLOGICAL SUPPLEMENT TO THE THEORY OF DREAMS

The present translation is a revised and corrected reprint of the *SE* version.

This paper, together with the next one ('Mourning and Melancholia'), seems to have been written over a period of eleven days between April 23 and May 4, 1915. It was not published until two years later. As its title implies, it is essentially an application of Freud's newly stated theoretical scheme to the hypotheses put forward in Chapter VII of *The Interpretation of Dreams*. But it resolves itself largely into a discussion of the effects produced by the state of sleep on the different 'systems' of the mind. And this discussion in turn is mainly concentrated on the problem of hallucination and on an investigation of how it is that in our normal state we are able to distinguish between phantasy and reality.

Freud had been occupied by this problem from early times. Much space was devoted to it in his 'Project' of 1895 (Freud, 1950*a*, especially in Part I, Sections 15 and 16, and in Part III, Section 1). And the solution he proposed for it there, though stated in a different terminology, visibly resembles the one put forward in the present [220] paper. It included two main lines of thought. Freud argued that the 'primary psychical processes' do not by themselves make any distinction between an idea and a perception; they need, in the first place, to be inhibited by the 'secondary psychical

processes', and these can only come into operation where there is an 'ego' with a large enough store of cathexis to provide the energy necessary to put the inhibition into effect. The aim of the inhibition is to give time for 'indications of reality' to arrive from the perceptual apparatus. But, in the second place, besides this inhibiting and delaying function, the ego is also responsible for directing cathexes of 'attention' (see above, p. 169 and *n*. 3) on to the external world, without which the indications of reality could not be observed.

In *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 506 ff. and 536 ff., the function of inhibition and delay was again insisted upon as an essential factor in the process of judging whether or not things are real and was once more attributed to the 'secondary process', though the ego was no longer mentioned as such. Freud's next serious discussion of the subject was in his paper on 'The Two Principles of Mental Functioning' (1911*b*), ibid., **12**, where for the first time he used the actual term 'reality-testing'. Here again the delaying feature of the process was emphasized, but the function of attention now came in for further notice. It was described as a periodic examination of the external world and was related particularly to the sense organs and to consciousness. This last side of the problem, the part played by the systems *Pcpt*. and *Cs*., is the one which is chiefly discussed in the paper which follows.

But Freud's interest in the subject was by no means exhausted by the present discussion. In *Group Psychology* (1921*c*), for instance, he attributed the work of reality-testing to the ego ideal (ibid., **18**, 106) – an attribution which, however, he withdrew very soon afterwards, in a footnote at the beginning of Chapter III of *The Ego and the Id* (1923*b*), ibid., **19**, 24 *n*. 2. And now for the first time since the early days of the 'Project' reality-testing was definitely ascribed to the ego. In a still later and particularly interesting discussion of the subject in the paper on 'Negation' (1925*h*), ibid., **19**, reality-testing was shown to depend on the ego's close genetic relation with the instruments of sense perception. In that paper, too (as well as at the end of the almost contemporary paper on the 'Mystic Writing-Pad', 1925*a*; ibid., **19**), there were
[221] further references to the ego's habit of sending out periodic exploratory cathexes into the external world – evidently an allusion in different terms to what had originally been described as 'attention'. But in 'Negation' Freud carried his analysis of reality-testing further, and traced the whole course of its development back to the individual's earliest object relations.

Freud's increasing interest in ego psychology in his later years led him to a closer examination of the relations of the ego to the external world. In two short papers (1924*b*) and (1924*e*), ibid., **19**, published soon after *The Ego and the Id*, he discussed the distinction between the ego's relation to reality in neuroses and psychoses. And in a paper on 'Fetishism' (1927*e*), ibid., **21**, he gave his first detailed account of a method of defence by the ego – '*Verleugnung*' ('disavowal' or 'denial') – which had not previously been clearly differentiated from repression and which described the ego's reaction to an intolerable external reality. This theme was developed still further in some of Freud's very latest writings, particularly in Chapter VIII of the posthumous *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**.

A METAPSYCHOLOGICAL SUPPLEMENT TO THE THEORY OF DREAMS[1]

We shall discover in various connections how much our enquiries benefit if certain states and phenomena which may be regarded as *normal prototypes* of pathological affections are brought up for purposes of comparison. Among these we may include such affective states as grief and being in love, as well as the state of sleep and the phenomenon of dreaming. [222]

We are not in the habit of devoting much thought to the fact that every night human beings lay aside the wrappings in which they have enveloped their skin, as well as anything which they may use as a supplement to their bodily organs (so far as they have succeeded in making good those organs' deficiencies by substitutes), for instance, their spectacles, their false hair and teeth, and so on. We may add that when they go to sleep they carry out an entirely analogous undressing of their minds and lay aside most of their psychical acquisitions. Thus on both counts they approach remarkably close to the situation in which they began life. Somatically, sleep is a reactivation of intrauterine existence, fulfilling as it does the conditions of repose, warmth and exclusion of stimulus; indeed, in sleep many people resume the foetal posture. The psychical state of a sleeping person is characterized by an almost complete withdrawal from the surrounding world and a cessation of all interest in it.

In investigating psychoneurotic states, we find ourselves led to emphasize in each of them what are known as *temporal regressions*, i.e. the amount of developmental recession peculiar to it. We distinguish two such regressions – one affecting the development of the ego [*Ich*][T] and the other that of the libido. In the state of sleep, the latter is carried to the

1 This paper and the following one are derived from a collection which I originally intended to publish in book form under the title *Zur Vorbereitung einer Metapsychologie* [Preliminaries to a Metapsychology]. They follow on some papers which were printed in Volume III of the *Internationale Zeitschrift für ärztliche Psychoanalyse* ('Drives and their Vicissitudes', 'Repression' and 'The Unconscious'). The intention of the series is to clarify and carry deeper the theoretical assumptions on which a psychoanalytic system could be founded. [See p. 93 above.]

[223] point of restoring primitive narcissism, while the former goes back to the stage of hallucinatory satisfaction of wishes. [Cf. below, p. 202.]

It is, of course, the study of dreams which has taught us what we know of the psychical characteristics of the state of sleep. It is true that dreams only show us the dreamer insofar as he is *not* sleeping; nevertheless they are bound to reveal at the same time characteristics of sleep itself. We have come to know from observation some peculiarities of dreams which we could not at first understand, but which we can now fit into the picture without difficulty. Thus, we know that dreams are completely egoistic[1] [*egoistisch*] and that the person who plays the chief part in their scenes is always to be recognized as the dreamer. This is now easily to be accounted for by the narcissism of the state of sleep. Narcissism and egoism, indeed, coincide; the word 'narcissism' is only intended to emphasize the fact that egoism is a libidinal phenomenon as well; or, to put it another way, narcissism may be described as the libidinal complement of egoism.[2] The 'diagnostic' capacity of dreams – a phenomenon which is generally acknowledged, but regarded as puzzling – becomes equally comprehensible, too. In dreams, incipient physical disease is often detected earlier and more clearly than in waking life, and all the current bodily sensations assume gigantic proportions.[3] This magnification is hypochondriacal in character; it is conditional upon the withdrawal of all psychical cathexes [*Besetzung*][T] from the external world back on to the ego, and it makes possible early recognition of bodily changes which in waking life would still for a time have remained unobserved.

A dream tells us that something was going on which tended to interrupt sleep, and it enables us to understand in what way it has been possible to
Abwehr fend off [*abgewehrt*][T] this interruption. The final outcome is that the sleeper has dreamt and is able to go on sleeping; the internal demand which was striving to occupy him has been replaced by an external experience, whose demand has been disposed of. A dream is, therefore, among other things, a *projection*: an externalization of an internal pro-
[224] cess. We may recall that we have already met with projection elsewhere among the means adopted for defence [*Abwehr*]. The mechanism of a hysterical phobia, too, culminates in the fact that the subject is able to protect himself by attempts at flight against an external danger which has

1 [Cf. *The Interpretation of Dreams*, Chapter V (D); *RSE*, **4**, 237 ff. See, however, the addition made in 1925 to a footnote, ibid., **4**, 240 *n.* 2.]

2 [A longer discussion of the relation between narcissism and egoism can be found in Lecture XXVI of Freud's *Introductory Lectures* (1916–17*a*), ibid., **16**.]

3 [Cf. *The Interpretation of Dreams*, ibid., **4**, 3 and 30–1.]

taken the place of an internal drive demand [*Triebanspruches*][T].[1] We will, *Trieb*
however, defer the full treatment of projection till we come to analyse the narcissistic disorder in which this mechanism plays the most striking part.[2]

In what way, however, can a case arise in which the intention to sleep meets with an interruption? The interruption may proceed from an internal excitation [*Erregung*][T] or from an external stimulus. Let us first consider the more obscure and more interesting case of interruption from within. Observation shows that dreams are instigated by residues from the previous day – thought cathexes [*Denkbesetzungen*] which have not submitted to the general withdrawal of cathexes, but have retained in spite of it a certain amount of libidinal or other interest.[3] Thus the narcissism of sleep has from the outset had to admit an exception at this point, and it is here that the formation of dreams takes its start. In analysis we make the acquaintance of these 'day's residues' in the shape of latent dream thoughts; and, both by reason of their nature and of the whole situation, we must regard them as preconscious ideas [*Vorstellungen*][T], as belonging to the system *Pcs*.

We cannot proceed any further in explaining the formation of dreams till we have overcome certain difficulties. The narcissism of the state of sleep implies a withdrawal of cathexis from all ideas of objects [*Objektvorstellungen*], from both the unconscious and the preconscious portions of those ideas. If, then, certain day's residues have retained their cathexis, we hesitate to suppose that they have acquired at night so much energy as to compel notice on the part of consciousness; we should be more inclined to suppose that the cathexis they have retained is far weaker than that which they possessed during the day. Here analysis saves us further speculation, for it shows that these day's residues must receive a reinforcement which has its source in unconscious drive impulses [*Triebregungen*][T] if they are to figure as constructors of dreams. *Regung*
This hypothesis presents no immediate difficulties, for we have every [225]
reason to suppose that in sleep the censorship between the *Pcs*. and the *Ucs*. is greatly reduced, so that communication between the two systems is made easier.[4]

But there is another doubt, which we must not pass over in silence. If the narcissistic state of sleep has resulted in a drawing in of all the

1 [See the paper on 'The Unconscious', above, p. 161 ff.]

2 [A possible reference to a missing paper on paranoia (p. 93 ff. above).]

3 [For this and the following paragraph see *The Interpretation of Dreams*, *RSE*, **5**, 495 f.]

4 [Ibid., **5**, 470.]

cathexes of the systems *Ucs*. and *Pcs*., then there can no longer be any possibility of the preconscious day's residues being reinforced by unconscious drive impulses, seeing that these themselves have surrendered their cathexes to the ego. Here the theory of dream formation ends up in a contradiction, unless we can rescue it by introducing a modification into our assumption about the narcissism of sleep.

A restrictive modification of this kind is, as we shall discover later,[1] necessary in the theory of dementia praecox as well. This must be to the effect that the repressed portion of the system *Ucs*. does not comply with the wish to sleep that comes from the ego, that it retains its cathexis in whole or in part, and that in general, in consequence of repression, it has acquired a certain measure of independence of the ego. Accordingly, too, some amount of the expenditure on repression (anticathexis) would have to be maintained throughout the night, in order to meet the drive danger – though the inaccessibility of all paths leading to a release of affect and to motility may considerably diminish the height of the anticathexis that is necessary.[2] Thus we should picture the situation which leads to the formation of dreams as follows. The wish to sleep endeavours to draw in all the cathexes sent out by the ego and to establish an absolute narcissism. This can only partly succeed, for what is repressed in the system *Ucs*. does not obey the wish to sleep. A part of the anticathexes has therefore to be maintained, and the censorship between the *Ucs*. and the *Pcs*. must remain, even if not at its full strength. So far as the dominance of the ego extends, all the systems are emptied of cathexes. The stronger the *Ucs*. drive cathexes are, the more unstable is sleep. We are acquainted, too, with the extreme case where the ego gives up the wish to sleep, because it feels unable to inhibit the repressed impulses set free during sleep – in other words, where it renounces sleep because of its fear of its dreams.[3]

[226] Later on we shall learn[4] to recognize the momentous nature of this hypothesis regarding the unruliness of repressed impulses. For the present let us follow out the situation which occurs in dream formation.

The possibility mentioned above [p. 199] – that some of the preconscious thoughts of the day may also prove resistant and retain a part of

1 [It is not clear what this refers to.]

2 [*RSE*, **5**, 507–8. See also above, p. 134.]

3 [*RSE*, **5**, 519.]

4 [The reference is again not clear.]

their cathexis – must be recognized as a second breach in narcissism.[1] At bottom, the two cases may be identical. The resistance of the day's residues may originate in a link with unconscious impulses which is already in existence during waking life; or the process may be somewhat less simple, and the day's residues which have not been wholly emptied of cathexis may establish a connection with the repressed material only after the state of sleep has set in, thanks to the easing of communication between the *Pcs*. and the *Ucs*. In both cases there follows the same decisive step in dream formation: the preconscious dream wish is formed, which *gives expression to the unconscious impulse in the material of the preconscious day's residues*. This dream wish must be sharply distinguished from the day's residues; it need not have existed in waking life and it may already display the irrational character possessed by everything that is unconscious when we translate it into the conscious. Again, the dream wish must not be confused with the wishful impulses which may have been present, though they certainly need not necessarily be present, among the preconscious (latent) dream thoughts. If, however, there *were* any such preconscious wishes, the dream wish associates itself with them, as a most effective reinforcement of them.

We have now to consider the further vicissitudes [*Schicksale*][T] undergone by this wishful impulse, which in its essence represents an unconscious drive demand and which has been formed in the *Pcs*. as a dream wish (a wish-fulfilling phantasy [*Phantasie*][T]). Reflection tells us that this wishful impulse may be dealt with along three different paths. It may follow the path that would be normal in waking life, by pressing from the *Pcs*. to consciousness; or it may by-pass the *Cs*. and find direct motor discharge [*Abfuhr*][T]; or it may take the unexpected path which observation enables us in fact to trace. In the first case, it would become a *delusion* having as content the fulfilment of the wish; but in the state of sleep this never happens. With our scanty knowledge of the metapsychological conditions of mental [*seelischen*][T] processes, we may perhaps take this fact as a hint that a complete emptying of a system renders it little susceptible to instigation. The second case, that of direct motor discharge, should be excluded by the same principle;[2] for access

abführen

[227]

Seele

1 [The first being the 'unruliness of repressed impulses'.]

2 [The 'principle of the insusceptibility to excitation of uncathected systems' (below, p. 208 *n*. 3) seems to be alluded to in one or two passages in Freud's later writings, e.g. in *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, 30, and in the paper on the 'Mystic Writing-Pad' (1925*a*), ibid., **19**, 230 f. But the principle is already foreshadowed in neurological terms in Freud's 1895 'Project' (1950*a*). In Part I, Section 11, of that work he lays it down that a quantity 'passes more easily from a neuron to a cathected neuron than to an uncathected one'; ibid., **1**, 344. And in Section 20 he actually applies this hypothesis to the very problem of motor discharge in dreams which is the subject of

to motility normally lies yet another step beyond the censorship of consciousness. But we do meet with exceptional instances in which this happens, in the form of *somnambulism*. We do not know what conditions make this possible, or why it does not happen more often. What actually happens in dream formation is a very remarkable and quite unforeseen turn of events. The process, begun in the *Pcs*. and reinforced by the *Ucs*., pursues a backward course, through the *Ucs*. to perception, which is pressing upon consciousness. This *regression* is the third phase of dream formation. For the sake of clarity, we will repeat the two earlier ones: the reinforcement of the *Pcs*. day's residues by the *Ucs*., and the setting up of the dream wish.

We call this kind of regression a *topographical* one, to distinguish it from the previously mentioned [p. 197 f. above] *temporal* or developmental regression.[1] The two do not necessarily always coincide, but they do so in the particular example before us. The reversal of the course of
[228] the excitation from the *Pcs*. through the *Ucs*. to perception is at the same time a return to the early stage of hallucinatory wish fulfilment.

We have already in *The Interpretation of Dreams* [*RSE*, **5**, 484 ff.] described the way in which the regression of the preconscious day's residues takes place in dream formation. In this process thoughts are transformed into images, mainly of a visual sort; that is to say, word presentations [*Wortvorstellungen*] are taken back to the thing presentations [*Sachvorstellungen*] which correspond to them, as if, in general, the process were dominated by considerations of *representability* [ibid., **5**, 489 f.]. When regression has been completed, a number of cathexes are left over in the system *Ucs*. – cathexes of memories of *things*. The primary psychical process is brought to bear on these memories, till, by condensation [*Verdichtung*][T] of them and displacement [*Verschiebung*][T] between their respective cathexes, it has shaped the manifest dream content. Only where the word presentations occurring in the day's residues are recent and current residues of *perceptions*, and not the expression of *thoughts*, are they themselves treated like

the present passage. He writes: 'Dreams *are devoid of motor discharge* and, for the most part, of motor elements. We are paralysed in dreams. The easiest explanation of this characteristic is the absence of spinal precathexis . . .' Since the neurons are uncathected, 'the motor excitation cannot pass over the barrier. . . .'; ibid., **1**, 363. A few paragraphs later on he discusses the 'retrogressive' nature of the hallucinatory characteristic of dreams, as he does in the later part of the present passage.]

1 [Cf. a paragraph added in 1914 to Chapter VII of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 490 (in which three kinds of regression are distinguished), and another discussion of regression near the beginning of Lecture XXII of the *Introductory Lectures* (1916–17*a*), ibid., **16**, 299 ff. See also Appendix A of the 'Project', ibid., **1**, 369 ff.]

thing presentations, and subjected to the influence of condensation and displacement. Hence the rule laid down in *The Interpretation of Dreams* [*RSE*, **5**, 373 ff.], and since confirmed beyond all doubt, that words and speeches in the dream content are not freshly formed, but are modelled on speeches from the day preceding the dream (or on some other recent impressions, such as something that has been read). It is very noteworthy how little the dream-work keeps to the word presentations; it is always ready to exchange one word for another till it finds the expression which is most handy for plastic representation.[1]

Now it is in this respect that the essential difference between the [229]
dream-work and schizophrenia becomes clear. In the latter, what becomes the subject of modification by the primary process are the words themselves in which the preconscious thought was expressed; in dreams, what are subject to this modification are not the words, but the thing presentations to which the words have been taken back.[2] In dreams there is a topographical regression; in schizophrenia there is not. In dreams there is free communication between (*Pcs*.) word cathexes and (*Ucs*.) thing cathexes, while it is characteristic of schizophrenia that this communication is cut off. The impression this difference makes on one is lessened precisely by the dream interpretations we carry out in psychoanalytic practice. For, owing to the fact that dream interpretation traces the course taken by the dream-work, follows the paths which lead from the latent thoughts to the dream elements, reveals the way in which verbal ambiguities have been exploited, and points out the verbal bridges between different groups of material – owing to all this, we get an impression now of a joke, now of schizophrenia, and are apt to forget that for a dream all operations with words are no more than a preparation for a regression to things.

1 I also ascribe to considerations of representability the fact which is insisted on and perhaps overestimated by Silberer [1914] that some dreams admit of two simultaneous, and yet essentially different interpretations [*Deutungen*]^{T}, one of which he calls the 'analytic' and the other the 'anagogic'. When this happens, we are invariably concerned with thoughts of a very abstract nature, which must have made their representation in the dream very difficult. We might compare it with the problem of representing in pictures a leading article from a political newspaper. In such cases, the dream-work must first replace the text that consists of abstract thoughts by one more concrete, connected with the former in some way – by comparison, symbolism, allegorical allusion, or best of all, genetically [*genetisch*]^{T} – so that the more concrete text then takes the place of the abstract one as material for the dream-work. The abstract thoughts yield the so-called anagogic interpretation, which, in our interpretative work, we discover more easily than the true analytic one. Otto Rank has justly remarked that certain dreams about their treatment, dreamt by patients in analysis, are the best models on which to form a view of these dreams which admit of more than one interpretation. [Freud added a paragraph on anagogic interpretations in 1919 to *The Interpretation of Dreams*, *RSE*, **5**, 468–9. See also 'Dreams and Telepathy' (1922*a*), ibid., **18**, 206 f.]

2 [Cf. 'The Unconscious' (p. 175 above).]

The completion of the dream process consists in the thought content – regressively transformed and worked over into a wishful phantasy – becoming conscious as a sense perception; while this is happening it undergoes secondary revision, to which every perceptual concept is subject. The dream wish, as we say, is *hallucinated*, and, as a hallucination, meets with belief in the reality of its fulfilment. It is precisely round this concluding piece in the formation of dreams that the gravest uncertainties centre, and it is in order to clear them up that we are proposing to compare dreams with pathological states akin to them.

The formation of the wishful phantasy and its regression to hallucination are the most essential parts of the dream-work, but they do not belong exclusively to dreams. They are also found in two morbid states:
[230] in acute hallucinatory confusion (Meynert's 'amentia'),[1] and in the hallucinatory phase of schizophrenia. The hallucinatory delirium of amentia is a clearly recognizable wishful phantasy, often completely well ordered like a perfect daydream. One might speak quite generally of a 'hallucinatory wishful psychosis', and attribute it equally to dreams and amentia. There are even dreams which consist of nothing but undistorted wishful phantasies with a very rich content.[2] The hallucinatory phase of schizophrenia has been less thoroughly studied; it seems as a rule to be of a composite nature, but in its essence it might well correspond to a fresh attempt at restitution, designed to restore a libidinal cathexis to the ideas of objects [*Objektvorstellungen*].[3] I cannot extend the comparison to the other hallucinatory states in various pathological disorders, because in their case I have no experience of my own upon which to draw, and cannot utilize that of other observers.

Let us be clear that the hallucinatory wishful psychosis – in dreams or elsewhere – achieves two by no means identical results. It not only brings hidden or repressed wishes into consciousness; it also represents them, with the subject's entire belief, as fulfilled. The concurrence of these two results calls for explanation. It is quite impossible to maintain that unconscious wishes must necessarily be taken for realities when once they have become conscious; for, as we know, our judgement is very well able to distinguish realities from ideas and wishes, however intense they may be. On the other hand, it seems justifiable to assume that belief in reality is bound up with perception through the senses. When once a

1 [In the rest of this paper the term 'amentia' should be understood as referring to this condition.]

2 [Cf. *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 117 *n*. 1.]

3 In the paper on 'The Unconscious' [see pp. 179–80 above] we recognized the hypercathexis of word presentations as a first attempt of this kind.

thought has followed the path to regression as far back as to the unconscious memory traces of objects and thence to perception, we accept the perception of it as real.[1] So hallucination brings belief in reality with it. We now have to ask ourselves what determines the coming into being of a hallucination. The first answer would be regression, and this would replace the problem of the origin of hallucination by that of the mechanism of regression. As regards dreams, this latter problem need not remain long unanswered. Regression of *Pcs*. dream thoughts to mnemic images of things [*Sacherinnerungsbildern*] is clearly the result of the attraction which the *Ucs*. drive representatives – e.g. repressed memories of experiences – exercise upon the thoughts which have been put into words.[2] But we soon perceive that we are on a false scent. If the secret of hallucination is nothing else than that of regression, every regression of sufficient intensity would produce hallucination with belief in its reality. But we are quite familiar with situations in which a process of regressive reflection brings to consciousness very clear visual mnemic images, though we do not on that account for a single moment take them for real perceptions. Again, we could very well imagine the dream-work penetrating to mnemic images of this kind, making conscious to us what was previously unconscious, and holding up to us a wishful phantasy which rouses our longing, but which we should not regard as a real fulfilment of the wish. Hallucination must therefore be something more than the regressive revival of mnemic images that are in themselves *Ucs*. [231]

Let us, furthermore, bear in mind the great practical importance of distinguishing perceptions from ideas, however intensely recalled. Our whole relation to the external world, to reality, depends on our ability to do so. We have put forward the fiction[3] that we did not always possess this ability and that at the beginning of our mental life we did in fact hallucinate the satisfying object when we felt the need for it. But in such a situation satisfaction did not occur, and this failure must very soon have moved us to create some contrivance with the help of which it was possible to distinguish such wishful perceptions from a real fulfilment and to avoid them for the future. In other words, we gave up hallucinatory satisfaction of our wishes at a very early period and set up a kind of 'reality-testing'.[4] The question now arises in what this reality-testing

1 [This point was made by Breuer in his theoretical contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 168 and *n*. He seems to attribute the idea to Meynert.]

2 [*The Interpretation of Dreams*, ibid., **5**, 486 f.]

3 [See Chapter VII (C) of *The Interpretation of Dreams*, ibid., **5**, 505 ff.]

4 [See Editors' Note, p. 196 above.]

consisted, and how the hallucinatory wishful psychosis of dreams and amentia and similar conditions succeeds in abolishing it and in re-establishing the old mode of satisfaction.

[232] The answer can be given if we now proceed to define more precisely the third of our psychical systems, the system *Cs*., which hitherto we have not sharply distinguished from the *Pcs*. In *The Interpretation of Dreams*[1] we were already led to a decision to regard conscious perception as the function of a special system, to which we ascribed certain curious properties, and to which we shall now have good grounds for attributing other characteristics as well. We may regard this system, which is there called the *Pcpt*., as coinciding with the system *Cs*., on whose activity becoming conscious usually depends.[2] Nevertheless, even so, the fact of a thing's becoming conscious still does not wholly coincide with its belonging to a system, for we have learnt that it is possible to be aware of sensory mnemic images to which we cannot possibly allow a psychical location in the systems *Cs.* or *Pcpt*.

We must, however, put off discussing this difficulty till we can focus our interest upon the system *Cs*. itself.[3] In the present connection we may be allowed to assume that hallucination consists in a cathexis of the system *Cs*. (*Pcpt*.), which, however, is not effected – as normally – from without, but from within, and that a necessary condition for the occurrence of hallucination is that regression shall be carried far enough to reach this system itself and in so doing be able to pass over reality-testing.[4]

In an earlier passage[5] we ascribed to the still helpless organism a capacity for making a first orientation in the world by means of its perceptions, distinguishing 'external' and 'internal' according to their relation to its muscular action. A perception which is made to disappear by an action is recognized as external, as reality; where such an action makes no difference, the perception originates within the subject's own body – it is not real. It is of value to the individual to possess a means

1 [Chapter VII (B), *RSE*, **5**, 476 ff.]

2 [This bald assertion gives no hint of Freud's uncertainty regarding the topographical relationship between perception (*Pcpt*.) and consciousness (*Cs*.) in his earlier theoretical writings. See two Editors' footnotes to the 'Project' (1950*a* [1895]) for some indication of this: ibid., **1**, 313 *n.* 2 and 350 *n.* 4.]

3 [Another probable reference to the missing paper on consciousness.]

4 I may add by way of supplement that any attempt to explain hallucination would have to start out from *negative* rather than positive hallucination.

5 'Drives and their Vicissitudes' [p. 104 f. above].

such as this of recognizing reality,[1] which at the same time helps him to deal with it, and he would be glad to be equipped with a similar power [*Macht*][T] against the often merciless claims of his drives. That is why he takes such pains to transpose outwards what becomes troublesome to him from within – that is, to *project* it.[2] [233]

This function of orientating the individual in the world by discrimination between what is internal and what is external must now, after detailed dissection of the mental apparatus, be ascribed to the system *Cs*. (*Pcpt*.) alone. The *Cs*. must have at its disposal a motor innervation which determines whether the perception can be made to disappear or whether it proves resistant. Reality-testing need be nothing more than this contrivance.[3] We can say nothing more precise on this point, for we know too little as yet of the nature and mode of operation of the system *Cs*. We shall place reality-testing among the major *institutions of the ego*, alongside the *censorships* which we have come to recognize between the psychical systems, and we shall expect that the analysis of the narcissistic disorders will help to bring other similar institutions to light. [Cf. p. 221 below.]

On the other hand, we can already learn from pathology the way in which reality-testing may be done away with or put out of action. We shall see this more clearly in the wishful psychosis of amentia than in that of dreams. Amentia is the reaction to a loss which reality affirms, but which the ego has to deny [*verleugnet*][T], since it finds it insupportable. *Verleugnung* Thereupon the ego breaks off its relation to reality; it withdraws the cathexis from the system of perceptions, *Cs*. – or rather, perhaps, it withdraws *a* cathexis, the special nature of which may be the subject of further enquiry. With this turning away from reality, reality-testing is got rid of, the (unrepressed, completely conscious) wishful phantasies are able to press forward into the system, and they are there regarded as a better reality. Such a withdrawal may be put on a par with the processes of repression [*Verdrängungsvorgängen*][T]. Amentia presents the interesting spectacle of a breach between the ego and one of its organs – one which

1 [In German: '*Kennzeichen der Realität*'. Cf. '*Realitätszeichen*' ('indications of reality') in the 'Project' (1950*a*), Part I, Section 15, etc.; *RSE*, **1**, 350.]

2 [Cf. the further discussion of 'external' and 'internal' in the much later paper on 'Negation' (1925*h*), ibid., **19**, 237 ff., and in Chapter I of *Civilization and its Discontents* (1930*a*), ibid., **21**, 59 ff.]

3 Cf. a later passage on the distinction between testing with regard to reality and testing with regard to immediacy. ['*Realitätsprüfung*' and '*Aktualitätsprüfung*'. No reference to the latter seems to occur anywhere else; and this may be one more reference to a missing paper.]

had perhaps been its most faithful servant and had been bound up with it the most intimately.[1]

[234] What is performed in amentia by this 'repression' is performed in dreams by voluntary renunciation. The state of sleep does not wish to know anything of the external world; it takes no interest in reality, or only so far as abandoning the state of sleep – waking up – is concerned. Hence it withdraws cathexis from the system *Cs*. as well as from the other systems, the *Pcs*. and the *Ucs*., insofar as the cathexes[2] in them obey the wish to sleep. With the system *Cs*. thus uncathected, the possibility of reality-testing is abandoned; and the excitations which, independently of the state of sleep, have entered on the path of regression will find that path clear as far as the system *Cs*. where they will count as undisputed reality.[3]

As regards the hallucinatory psychosis of dementia praecox, we shall infer from our discussion that that psychosis cannot be among the initial symptoms of the affection. It becomes possible only when the patient's ego is so far disintegrated that reality-testing no longer stands in the way of hallucination.

In what concerns the psychology of dream processes we arrive at the result that all the essential characteristics of dreams are determined by the conditioning factor of sleep. Aristotle was entirely right, long ago, in his modest pronouncement that dreams are the mental activity of the sleeper.[4] We might expand this and say: they are a residue of mental activity, made possible by the fact that the narcissistic state of sleep has not been able to be completely established. This does not sound very different from what psychologists and philosophers have said all along,

[235] but it is based on quite different views about the structure and function of the mental apparatus. These views have this advantage over the earlier

1 I may venture to suggest in this connection that the toxic hallucinoses, too, e.g. alcoholic delirium, are to be understood in an analogous fashion. Here the unbearable loss imposed by reality would be precisely the loss of alcohol. When the latter is supplied, the hallucinations cease.

2 [The German word here is '*Positionen*', 'military posts'. The use of the metaphor was no doubt suggested by the fact that '*Besetzung*' ('cathexis') can itself be used in the sense of 'military occupation'.]

3 Here the principle of the insusceptibility to excitation of uncathected systems [cf. p. 201 above] appears to be set aside in the case of the system *Cs*. (*Pcpt*.). But it may be a question of only the *partial* removal of cathexis; and for the perceptual system especially we must assume many conditions for excitation which are widely divergent from those of other systems. – We are not, of course, intending to disguise or gloss over the uncertain and tentative character of these metapsychological discussions. Only deeper investigation can lead to the achievement of a certain degree of probability.

4 [Quoted in *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 2.]

ones, that they have given us an understanding, too, of all the detailed characteristics of dreams.

Finally, let us once more glance at the significant light which the *topography* of the process of repression throws for us on the mechanism of mental disturbances. In dreams the withdrawal of cathexis (libido or interest) affects all systems equally; in the transference neuroses, the *Pcs.* cathexis is withdrawn; in schizophrenia, the cathexis of the *Ucs.*; in amentia, that of the *Cs.*

MOURNING AND MELANCHOLIA

The present translation is a revised and corrected reprint of the *SE* version.

As we learn from Ernest Jones (1955, 367–8), Freud had expounded the theme of the present paper to him in January, 1914; and he spoke of it to the Vienna Psychoanalytical Society on December 30 of that year. He wrote a first draft of the paper in February, 1915. He submitted this to Abraham, who sent him some lengthy comments, which included the important suggestion that there was a connection between melancholia and the oral stage of libidinal development (p. 223 below). The final draft of the paper was finished on May 4, 1915, but, like its predecessor, it was not published till two years later.

In very early days (probably in January, 1895) Freud had sent Fliess an elaborate attempt at explaining melancholia (under which term he regularly included what are now usually described as states of depression) in purely neurological terms (Freud, 1950*a*, Draft G).

This attempt was not particularly fruitful, but it was soon replaced by a psychological approach to the subject. Only two years later we find one of the most [240] remarkable instances of Freud's prevision. It occurs in a manuscript, also addressed

to Fliess, and bearing the title 'Notes (III)'. This manuscript, dated May 31, 1897, is incidentally the one in which Freud first foreshadowed the Oedipus complex (Freud, 1950*a*, Draft N). The passage in question, whose meaning is so condensed as to be in places obscure, deserves to be quoted in full:

> Hostile impulses against parents (a wish that they should die) are also an integral constituent of neuroses. They come to light consciously as obsessional ideas. In paranoia what is worst in delusions of persecution (pathological distrust of rulers and monarchs) corresponds to these impulses. They are repressed at times when compassion for the parents is active – at times of their illness or death. On such occasions it is a manifestation of mourning to reproach oneself for their death (what is known as melancholia) or to punish oneself in a hysterical fashion (through the medium of the idea of retribution) with the same states [of illness] that they have had. The identification which occurs here is, as we can see, nothing other than a mode of thinking and does not relieve us of the necessity for looking for the motive.

The further application to melancholia of the line of thought outlined in this passage seems to have been left completely on one side by Freud. Indeed he scarcely mentioned the condition again before the present paper, except for some remarks in a discussion on suicide at the Vienna Psychoanalytical Society in 1910 (*RSE*, **11**, 222), when he stressed the importance of drawing a comparison between melancholia and normal states of mourning, but declared that the psychological problem involved was still insoluble.

What enabled Freud to reopen the subject was, of course, the introduction of the concepts of narcissism and of an ego ideal. The present paper may, indeed, be regarded as an extension of the one on narcissism which Freud had written a year earlier (1914*c*). Just as that paper had described the workings of the 'critical agency' in cases of paranoia (see above, p. 83 f.), so this one sees the same agency in operation in melancholia.

But the implications of this paper were destined to be more important than the explanation of the mechanism of one particular pathological state, though those implications did not become immediately obvious. The material contained here led
[241] on to the further consideration of the 'critical agency' which is to be found in Chapter XI of *Group Psychology* (1921*c*), *RSE*, **18**, 120 ff.; and this in turn led on to the hypothesis of the superego in *The Ego and the Id* (1923*b*), ibid., **19**, and to a fresh assessment of the sense of guilt.

Along another line, this paper called for an examination of the whole question of the nature of identification. Freud seems to have been inclined at first to regard it as closely associated with, and perhaps dependent on, the oral or cannibalistic phase of libidinal development. Thus in *Totem and Taboo* (1912–13*a*), ibid., **13**, 131, he had written of the relation between the sons and the father of the primal horde

that 'in the act of devouring him they accomplished their identification with him'. And again, in a passage added to the third edition of the *Three Essays*, published in 1915 but written some months before the present paper, he described the cannibalistic oral phase as 'the prototype of a process which, in the form of *identification*, is later to play such an important psychological part' (*RSE*, **7**, 175). In the present paper (p. 223 below) he speaks of identification as 'a preliminary stage of object choice . . . the first way . . . in which the ego picks out an object' and adds that 'the ego wants to incorporate this object into itself, and, in accordance with the oral or cannibalistic phase of libidinal development in which it is, it wants to do so by devouring it'.[1] And indeed, though Abraham may have suggested the relevance of the oral phase to melancholia, Freud's own interest had already begun to turn to it, as is shown by the discussion of it in the 'Wolf Man' case history (1918*b*) which was written during the autumn of 1914 and in which a prominent part was played by that phase. (See *RSE*, **17**, 201.) A few years later, in *Group Psychology* (1921*c*), ibid., **18**, 97 ff., where the subject of identification is taken up again, explicitly in continuation of the present discussion, a change in the earlier view – or perhaps only a clarification of it – seems to emerge. Identification, we there learn, is something that *precedes* object cathexis and is distinct from it, though we are still told [242] that 'it behaves like a derivative of the first, *oral* phase'. This view of identification is consistently emphasized in many of Freud's later writings, as, for instance, in Chapter III of *The Ego and the Id* (1923*b*), ibid., **19**, 27, where he writes that identification with the parents 'is apparently not in the first instance the consequence or outcome of an object cathexis; it is a direct and immediate identification and takes place earlier than any object cathexis'.

What Freud seems later to have regarded as the most significant feature of this paper was, however, its account of the process by which in melancholia an object cathexis is replaced with an identification. In Chapter III of *The Ego and the Id*, he argued that this process is not restricted to melancholia but is of quite general occurrence. These regressive identifications, he pointed out, were to a large extent the basis of what we describe as a person's 'character'. But, what was far more important, he suggested that the very earliest of these regressive identifications – those derived from the dissolution of the Oedipus complex – come to occupy a quite special position, and form, in fact, the nucleus of the superego.

1 The term 'introjection' does not occur in this paper, though Freud had already used it, in a different connection, in the first of these metapsychological papers (p. 119 above). When he returned to the topic of identification, in the chapter of his *Group Psychology* referred to in the text, he used the word 'introjection' at several points, and it reappears, though not very frequently, in his subsequent writings.

MOURNING AND MELANCHOLIA

Dreams having served us as the prototype in normal life of narcissistic mental disorders [*Seelenstörungen*][T], we will now try to throw some light on the nature of melancholia by comparing it with the normal affect of mourning.[1] This time, however, we must begin by making an admission, as a warning against any overestimation of the value of our conclusions. Melancholia, whose definition fluctuates even in descriptive psychiatry, takes on various clinical forms the grouping together of which into a single unity does not seem to be established with certainty; and some of these forms suggest somatic rather than psychogenic affections. Our material, apart from such impressions as are open to every observer, is limited to a small number of cases whose psychogenic nature was indisputable. We shall, therefore, from the outset drop all claim to general validity for our conclusions, and we shall console ourselves by reflecting that, with the means of investigation at our disposal today, we could hardly discover anything that was not typical, if not of a whole class of disorders, at least of a small group of them. [243] *Seele*

The correlation of melancholia and mourning seems justified by the general picture of the two conditions.[2] Moreover, the exciting causes due to environmental influences are, so far as we can discern them at all, the same for both conditions. Mourning is regularly the reaction to the loss of a loved person, or to the loss of some abstraction which has taken the place of one, such as one's country, liberty, an ideal, and so on. In some people the same influences produce melancholia instead of mourning and we consequently suspect them of a pathological disposition. It is also well worth notice that, although mourning involves grave departures from the normal attitude to life, it never occurs to us to regard it as a pathological condition and to refer it to medical treatment. We rely on [244]

1 [The German '*Trauer*', like the English 'mourning', can mean both the affect of grief and its outward manifestation. Throughout the present paper, the word has been rendered 'mourning'.][T]

2 Abraham (1912), to whom we owe the most important of the few analytic studies on this subject, also took this comparison as his starting point. [Freud himself had already made the comparison in 1910 and even earlier. (See Editors' Note, p. 214 above.)]

its being overcome after a certain lapse of time, and we look upon any interference with it as useless or even harmful.

The distinguishing mental features of melancholia are a profoundly painful dejection, cessation of interest in the outside world, loss of the capacity to love, inhibition [*Hemmung*][T] of all activity, and a lowering of the self-regarding feelings [*Selbstgefühls*] to a degree that finds utterance in self-reproaches and self-revilings, and culminates in a delusional expectation of punishment. This picture becomes a little more intelligible when we consider that, with one exception, the same traits are met with in mourning. The disturbance of self-regard is absent in mourning; but otherwise the features are the same. Profound mourning, the reaction to the loss of someone who is loved, contains the same painful frame of mind, the same loss of interest in the outside world – insofar as it does not recall him – the same loss of capacity to adopt any new object of love (which would mean replacing him) and the same turning away from any activity that is not connected with thoughts of him. It is easy to see that this inhibition and circumscription of the ego [*Ichs*][T] is the expression of an exclusive devotion to mourning which leaves nothing over for other purposes or other interests. It is really only because we know so well how to explain it that this attitude does not seem to us pathological.

We should regard it as an appropriate comparison, too, to call the mood of mourning a 'painful' ['*schmerzliche*'] one. We shall probably see the justification for this when we are in a position to give a characterization of the economics of pain.[1]

In what, now, does the work which mourning performs consist? I do not think there is anything far-fetched in presenting it in the following way. Reality-testing has shown that the loved object no longer exists, and it proceeds to demand that all libido shall be withdrawn from its attachments [*Verknüpfungen*] to that object. This demand arouses understandable opposition – it is a matter of general observation that people never willingly abandon a libidinal position, not even, indeed, when a substitute is already beckoning to them. This opposition can be so intense that a turning away from reality takes place and a clinging to the object through the medium of a hallucinatory wishful psychosis.[2]

[245] Normally, respect for reality gains the day. Nevertheless, its orders cannot be obeyed at once. They are carried out bit by bit, at great expense of

Besetzung time and cathectic energy [*Besetzungsenergie*][T], and in the meantime the existence of the lost object is psychically prolonged. Each single one of

1 [See footnote 1, p. 130 above.]

2 Cf. the preceding paper [p. 204].

the memories and expectations in which the libido is bound to the object is brought up and hypercathected, and detachment of the libido is accomplished in respect of it.[1] Why this compromise by which the command of reality is carried out piecemeal should be so extraordinarily painful is not at all easy to explain in terms of economics. It is remarkable that this painful unpleasure [*Schmerzunlust*][T] is taken as a matter of course by us. The fact is, however, that when the work of mourning is completed the ego becomes free and uninhibited again.[2]

Let us now apply to melancholia what we have learnt about mourning. In one set of cases it is evident that melancholia too may be the reaction to the loss of a loved object. Where the exciting causes are different one can recognize that there is a loss of a more ideal kind. The object has not perhaps actually died, but has been lost as an object of love (e.g. in the case of a betrothed girl who has been jilted). In yet other cases one feels justified in maintaining the belief that a loss of this kind has occurred, but one cannot see clearly what it is that has been lost, and it is all the more reasonable to suppose that the patient cannot consciously perceive what he has lost either. This, indeed, might be so even if the patient is aware of the loss which has given rise to his melancholia, but only in the sense that he knows *whom* he has lost but not *what* he has lost in him. This would suggest that melancholia is in some way related to an object loss which is withdrawn from consciousness, in contradistinction to mourning, in which there is nothing about the loss that is unconscious.

In mourning we found that the inhibition and loss of interest are fully accounted for by the work of mourning in which the ego is absorbed. In melancholia, the unknown loss will result in a similar internal work and will therefore be responsible for the melancholic inhibition. The difference is that the inhibition of the melancholic seems puzzling to us because [246]
we cannot see what it is that is absorbing him so entirely. The melancholic displays something else besides which is lacking in mourning – an extraordinary diminution in his self-regard [*Ichgefühls*], an impoverishment of his ego [*Ichverarmung*] on a grand scale. In mourning it is the world which has become poor and empty; in melancholia it is the ego itself. The patient represents his ego to us as worthless, incapable of any achievement and morally despicable; he reproaches himself, vilifies himself and expects to be cast out and punished. He abases himself before everyone and commiserates with his own relatives for being connected

1 [This idea seems to be expressed already in *Studies on Hysteria* (1895*d*): a process similar to this one can be found described near the beginning of Freud's 'Discussion' of the case history of Fräulein Elisabeth von R. (*RSE*, **2**, 144 f.).]

2 [A discussion of the economics of this process can be found below on p. 227 f.]

with anyone so unworthy. He is not of the opinion that a change has taken place in him, but extends his self-criticism back over the past; he declares that he was never any better. This picture of a delusion of (mainly moral) inferiority is completed by sleeplessness and refusal to take nourishment, and – what is psychologically very remarkable – by an
Trieb overcoming of the drive [*Triebes*][T] which compels every living thing to cling to life.

It would be equally fruitless from a scientific and a therapeutic point of view to contradict a patient who brings these accusations against his ego. He must surely be right in some way and be describing something that is as it seems to him to be. Indeed, we must at once confirm some of his statements without reservation. He really is as lacking in interest and as incapable of love and achievement as he says. But that, as we know, is secondary; it is the effect of the internal work which is consuming his ego – work which is unknown to us but which is comparable to the work of mourning. He also seems to us justified in certain other self-accusations; it is merely that he has a keener eye for the truth than other people who are not melancholic. When in his heightened self-criticism he describes himself as petty, egoistic, dishonest, lacking in independence, one whose sole aim has been to hide the weaknesses of his own nature, it may be, so far as we know, that he has come pretty near to understanding himself; we only wonder why a man has to be ill before he can be accessible to a truth of this kind. For there can be no doubt that if anyone holds and expresses to others an opinion of himself such as this (an opinion which Hamlet held both of himself and of everyone else[1]), he is ill, whether he
[247] is speaking the truth or whether he is being more or less unfair to himself. Nor is it difficult to see that there is no correspondence, so far as we can judge, between the degree of self-abasement and its real justification. A good, capable, conscientious woman will speak no better of herself after she develops melancholia than one who is in fact worthless; indeed, the former is perhaps more likely to fall ill of the disease than the latter, of whom we too should have nothing good to say. Finally, it must strike us that after all the melancholic does not behave in quite the same way as a person who is crushed by remorse and self-reproach in a normal fashion. Feelings of shame in front of other people, which would more than anything characterize this latter condition, are lacking in the melancholic, or at least they are not prominent in him. One might emphasize the presence in him of an almost opposite trait of insistent communicativeness which finds satisfaction in self-exposure.

1 'Use every man after his desert, and who shall scape whipping?' (Act II, Scene 2).

The essential thing, therefore, is not whether the melancholic's distressing self-denigration is correct, in the sense that his self-criticism agrees with the opinion of other people. The point must rather be that he is giving a correct description of his psychological situation. He has lost his self-respect and he must have good reason for this. It is true that we are then faced with a contradiction that presents a problem which is hard to solve. The analogy with mourning led us to conclude that he had suffered a loss in regard to an object; what he tells us points to a loss in regard to his ego.

Before going into this contradiction, let us dwell for a moment on the view which the melancholic's disorder affords of the constitution of the human ego. We see how in him one part of the ego sets itself over against the other, judges it critically, and, as it were, takes it as its object. Our suspicion that the critical agency which is here split off from the ego might also show its independence in other circumstances will be confirmed by every further observation. We shall really find grounds for distinguishing this agency from the rest of the ego. What we are here becoming acquainted with is the agency commonly called 'conscience'; we shall count it, along with the censorship of consciousness and reality-testing, among the major institutions of the ego,[1] and we shall come upon evidence to show that it can become diseased on its own account. In the clinical picture of melancholia, dissatisfaction with the ego on moral [248]
grounds is the most outstanding feature. The patient's self-evaluation concerns itself much less frequently with bodily infirmity, ugliness or weakness, or with social inferiority; of this category, it is only his fears and asseverations of becoming poor that occupy a prominent position.

There is one observation, not at all difficult to make, which leads to the explanation of the contradiction mentioned above [at the end of the last paragraph but one]. If one listens patiently to a melancholic's many and various self-accusations, one cannot in the end avoid the impression that often the most violent of them are hardly at all applicable to the patient himself, but that with insignificant modifications they do fit someone else, someone whom the patient loves or has loved or should love. Every time one examines the facts this conjecture is confirmed. So we find the key to the clinical picture: we perceive that the self-reproaches are reproaches against a loved object which have been shifted away from it on to the patient's own ego.

The woman who loudly pities her husband for being tied to such an incapable wife as herself is really accusing her *husband* of being

1 [See above, p. 207.]

incapable, in whatever sense she may mean this. There is no need to be greatly surprised that a few genuine self-reproaches are scattered among those that have been transposed back. These are allowed to obtrude themselves, since they help to mask the others and make recognition of the true state of affairs impossible. Moreover, they derive from the pros and cons of the conflict of love that has led to the loss of love. The behaviour of the patients, too, now becomes much more intelligible. Their complaints are really 'plaints' in the old sense of the word. They are not ashamed and do not hide themselves, since everything derogatory that they say about themselves is at bottom said about someone else. Moreover, they are far from evincing towards those around them the attitude of humility and submissiveness that would alone befit such worthless people. On the contrary, they make the greatest nuisance of themselves, and always seem as though they felt slighted and had been treated with great injustice. All this is possible only because the reactions expressed in their behaviour still proceed from a mental constellation of revolt, which has then, by a certain process, passed over into the crushed state of melancholia.

[249] There is no difficulty in reconstructing this process. An object choice, an attachment [*Bindung*] of the libido to a particular person, had at one time existed; then, owing to a real slight or disappointment coming from this loved person, the object relationship was shattered. The result was not the normal one of a withdrawal of the libido from this object and a displacement of it on to a new one, but something different, for whose coming about various conditions seem to be necessary. The object cathexis proved to have little power of resistance and was brought to an

Verschiebung end. But the free libido was not displaced [*verschoben*][T] on to another object; it was withdrawn into the ego. There, however, it was not employed in any unspecified way, but served to establish an *identification* of the ego with the abandoned object. Thus the shadow of the object fell upon the ego, and the latter could henceforth be judged by a special[I] agency, as though it were an object, the forsaken object. In this way an object loss was transformed into an ego loss and the conflict between the ego and the loved person into a cleavage between the critical activity of the ego and the ego as altered by identification.

One or two things may be directly inferred with regard to the preconditions and effects of a process such as this. On the one hand, a strong fixation to the loved object must have been present; on the other hand, in contradiction to this, the object cathexis must have had little power of

1 [In the first (1917) edition only, this word does not occur.]

resistance. As Otto Rank has aptly remarked, this contradiction seems to imply that the object choice has been effected on a narcissistic basis, so that the object cathexis, when obstacles come in its way, can regress to narcissism. The narcissistic identification with the object then becomes a substitute for the erotic cathexis, the result of which is that in spite of the conflict with the loved person the love relation need not be given up. This substitution of identification for object love is an important mechanism in the narcissistic affections; Karl Landauer (1914) has lately been able to point to it in the process of recovery in a case of schizophrenia. It represents, of course, a *regression* from one type of object choice to original narcissism. We have elsewhere shown that identification is a preliminary stage of object choice, that it is the first way – and one that is expressed in an ambivalent fashion – in which the ego picks out an object. The ego wants to incorporate this object into itself, and, in accordance with the oral or cannibalistic phase of libidinal development in which it is, it wants to do so by devouring it.[1] Abraham is undoubtedly right in attributing to this connection the refusal of nourishment met with in severe forms of melancholia.[2] [250]

The conclusion which our theory would require – namely, that the disposition to fall ill of melancholia (or some part of that disposition) lies in the predominance of the narcissistic type of object choice – has unfortunately not yet been confirmed by observation. In the opening remarks of this paper, I admitted that the empirical material upon which this study is founded is insufficient for our needs. If we could assume an agreement between the results of observation and what we have inferred, we should not hesitate to include this regression from object cathexis to the still narcissistic oral phase of the libido in our characterization of melancholia. Identifications with the object are by no means rare in the transference neuroses [*Übertragungsneurosen*][T] either; indeed, they are a well-known mechanism of symptom-formation, especially in hysteria. The difference, however, between narcissistic and hysterical identification may be seen in this: that, whereas in the former the object cathexis is abandoned, in the latter it persists and manifests its influence, though this is usually confined to certain isolated actions and innervations. In any case, in the transference neuroses, too, identification is the expression of there being something in common, which may signify love. Narcissistic identification is the older of the two and it paves the way to *Übertragung*

1 [See above, p. 122. Cf. also Editors' Note, pp. 214–15.]

2 [Abraham apparently first drew Freud's attention to this in a private letter written on March 31, 1915. (Cf. Freud, 1965*a*.) See Jones's biography (1955, 368).]

an understanding of hysterical identification, which has been less thoroughly studied.[1]

Melancholia, therefore, borrows some of its features from mourning, and the others from the process of regression from narcissistic object choice to narcissism. It is on the one hand, like mourning, a reaction to the real loss of a loved object; but over and above this, it is marked by a determinant which is absent in normal mourning or which, if it is present, transforms the latter into pathological mourning. The loss of a love
[251] object is an excellent opportunity for the ambivalence in love relationships to make itself effective and come into the open.[2] Where there is a disposition to obsessional neurosis the conflict due to ambivalence gives a pathological cast to mourning and forces it to express itself in the form of self-reproaches to the effect that the mourner himself is to blame for the loss of the loved object, i.e. that he has willed it. These obsessional states of depression following upon the death of a loved person show us what the conflict due to ambivalence can achieve by itself when there is no regressive drawing in of libido as well. In melancholia, the occasions which give rise to the illness extend for the most part beyond the clear case of a loss by death, and include all those situations of being slighted, neglected or disappointed, which can import opposed feelings of love and hate into the relationship or reinforce an already existing ambivalence. This conflict due to ambivalence, which sometimes arises more from real experiences, sometimes more from constitutional factors, must not be overlooked among the preconditions of melancholia. If the love for the object – a love which cannot be given up though the object itself is given up – takes refuge in narcissistic identification, then the hate comes into operation on this substitutive object, abusing it, debasing it, making it suffer and deriving sadistic satisfaction from its suffering. The self-tormenting in melancholia, which is without doubt enjoyable, signifies, just like the corresponding phenomenon in obsessional neurosis, a satisfaction of trends of sadism and hate[3] which relate to an object, and which have been turned round upon the subject's own self in the ways we have been discussing. In both disorders the patients usually still succeed, by the circuitous path of self-punishment, in taking revenge on the original object and in tormenting their loved one through their illness,

1 [The whole subject of identification was discussed later by Freud in Chapter VII of his *Group Psychology* (1921*c*), *RSE*, **18**, 97 ff. There is an early account of hysterical identification in *The Interpretation of Dreams* (1900*a*), ibid., **4**, 132–4.]

2 [Much of what follows is elaborated in Chapter V of *The Ego and the Id* (1923*b*), ibid., **19**, 45 f.]

3 For the distinction between the two, see my paper on 'Drives and their Vicissitudes' [pp. 121–2 above].

having resorted to it in order to avoid the need to express their hostility to him openly. After all, the person who has occasioned the patient's emotional disorder, and on whom his illness is centred, is usually to be found in his immediate environment. The melancholic's erotic cathexis in regard to his object has thus undergone a double vicissitude [*Schicksal*][T]: part of it has regressed to identification, but the other part, under the influence of the conflict due to ambivalence, has been carried back to [252]
the stage of sadism which is nearer to that conflict.

It is this sadism alone that solves the riddle of the tendency to suicide which makes melancholia so interesting – and so dangerous. So immense is the ego's self-love, which we have come to recognize as the primal state from which drive activity proceeds, and so vast is the amount of narcissistic libido which we see liberated in the fear [*Angst*][T] that emerges at a threat to life, that we cannot conceive how that ego can consent to its own destruction. We have long known, it is true, that no neurotic harbours thoughts of suicide which he has not turned back upon himself from murderous impulses against others, but we have never been able to explain what interplay of forces [*Kräftespiel*][T] can carry such a purpose *Kraft*
through to execution. The analysis of melancholia now shows that the ego can kill itself only if, owing to the return of the object cathexis, it can treat itself as an object – if it is able to direct against itself the hostility which relates to an object and which represents the ego's original reaction to objects in the external world.[1] Thus in regression from narcissistic object choice the object has, it is true, been got rid of, but it has nevertheless proved more powerful than the ego itself. In the two opposed situations of being most intensely in love and of suicide the ego is overwhelmed by the object, though in totally different ways.[2]

As regards one particular striking feature of melancholia that we have mentioned [p. 221 above], the prominence of the fear of becoming poor, it seems plausible to suppose that it is derived from anal erotism which has been torn out of its context and altered in a regressive sense.

Melancholia confronts us with yet other problems, the answer to which in part eludes us. The fact that it passes off after a certain time has elapsed without leaving traces of any gross changes is a feature it shares with mourning. We found by way of explanation [pp. 218–19 above] that in mourning time is needed for the command of reality-testing to be carried out in detail, and that when this work has been accomplished the

1 Cf. 'Drives and their Vicissitudes' [p. 119 f. above].

2 [Later discussions of suicide can be found in Chapter V of *The Ego and the Id* (1923*b*), *RSE*, **19**, 47 f., and in 'The Economic Problem of Masochism' (1924*c*), ibid., **19**, 160–1.]

ego will have succeeded in freeing its libido from the lost object. We may
[253] imagine that the ego is occupied with analogous work during the course of a melancholia; in neither case have we any insight into the economics of the course of events. The sleeplessness in melancholia testifies to the rigidity of the condition, the impossibility of effecting the general drawing in of cathexes necessary for sleep. The complex of melancholia behaves like an open wound, drawing to itself cathectic energies – which in the transference neuroses we have called 'anticathexes' – from all directions, and emptying the ego until it is totally impoverished.[1] It can easily prove resistant to the ego's wish to sleep.

What is probably a somatic factor, and one which cannot be explained psychogenically, makes itself visible in the regular amelioration in the condition that takes place towards evening. These considerations bring up the question whether a loss in the ego irrespectively of the object – a purely narcissistic blow to the ego – may not suffice to produce the picture of melancholia and whether an impoverishment of ego libido directly due to toxins may not be able to produce certain forms of the disease.

The most remarkable characteristic of melancholia, and the one in most need of explanation, is its tendency to change round into mania – a state which is the opposite of it in its symptoms. As we know, this does not happen to every melancholia. Some cases run their course in periodic relapses, during the intervals between which signs of mania may be entirely absent or only very slight. Others show the regular alternation of melancholic and manic phases which has led to the hypothesis of a cyclical insanity. One would be tempted to regard these cases as non-psychogenic, if it were not for the fact that the psychoanalytic method has succeeded in arriving at a solution and effecting a therapeutic improvement in several cases precisely of this kind. It is not merely permissible, therefore, but incumbent upon us to extend an analytic explanation of melancholia to mania as well.

I cannot promise that this attempt will prove entirely satisfactory. It hardly carries us much beyond the possibility of taking one's initial
[254] bearings. We have two things to go upon: the first is a psychoanalytic impression, and the second what we may perhaps call a matter of general economic experience. The impression which several psychoanalytic

1 [This analogy of the open wound appears already (illustrated by two diagrams) in the rather abstruse Section VI of Freud's early note on melancholia (Freud, 1950*a*, Draft G, probably written in January, 1895). See Editors' Note, p. 213 above.]

investigators have already put into words is that the content of mania is no different from that of melancholia, that both disorders are wrestling with the same 'complex', but that probably in melancholia the ego has succumbed to the complex whereas in mania it has mastered it or pushed it aside. Our second pointer is afforded by the observation that all states such as joy, exultation or triumph, which give us the normal model for mania, depend on the same economic conditions. What has happened here is that, as a result of some influence, a large expenditure of psychical energy, long maintained or habitually occurring, has at last become unnecessary, so that it is available for numerous applications and possibilities of discharge [*Abfuhrmöglichkeiten*][T] – when, for instance, some poor wretch, by winning a large sum of money, is suddenly relieved of chronic worry about his daily bread, or when a long and arduous struggle is finally crowned with success, or when a man finds himself in a position to throw off at a single blow some oppressive compulsion [*Zwang*][T], some false position which he has long had to keep up, and so on. All such situations are characterized by high spirits, by the signs of discharge of joyful emotion and by increased readiness for all kinds of action – in just the same way as in mania, and in complete contrast to the depression and inhibition of melancholia. We may venture to assert that mania is nothing other than a triumph of this sort, only that here again what the ego has surmounted and what it is triumphing over remain hidden from it. Alcoholic intoxication, which belongs to the same class of states, may (insofar as it is an elated one) be explained in the same way; here there is probably a suspension, produced by toxins, of expenditures of energy in repression [*Verdrängung*][T]. The popular view likes to assume that a person in a manic state of this kind finds such delight in movement and action because he is so 'cheerful'. This false connection must of course be put right. The fact is that the economic condition in the subject's mind referred to above has been fulfilled, and this is the reason why he is in such high spirits, on the one hand, and so uninhibited in action, on the other.

abführen

If we put these two indications together,[1] what we find is this. In mania, [255]
the ego must have got over the loss of the object (or its mourning over the loss, or perhaps the object itself), and thereupon the whole quota of anticathexis which the painful suffering of melancholia had drawn to itself from the ego and 'bound' will have become available [p. 226 above]. Moreover, the manic subject plainly demonstrates his liberation from the

1 [The 'psychoanalytic impression' and the 'general economic experience'.]

object which was the cause of his suffering, by seeking like a ravenously hungry man new object cathexes.

This explanation certainly sounds plausible, but in the first place it is too indefinite, and, secondly, it gives rise to more new problems and doubts than we can answer. We will not evade a discussion of them, even though we cannot expect it to lead us to a clear understanding.

In the first place, normal mourning, too, overcomes the loss of the object, and it, too, while it lasts, absorbs all the energies of the ego. Why, then, after it has run its course, is there no hint in its case of the economic condition for a phase of triumph? I find it impossible to answer this objection straight away. It also draws our attention to the fact that we do not even know the economic means by which mourning carries out its task [p. 219 above]. Possibly, however, a conjecture will help us here. Each single one of the memories and situations of expectancy which demonstrate the libido's attachment to the lost object is met with the verdict of reality that the object no longer exists; and the ego, confronted as it were with the question whether it shall share this fate [*Schicksal*], is persuaded by the sum of the narcissistic satisfactions it derives from being alive to sever its attachment to the object that has been abolished. We may perhaps suppose that this work of severance is so slow and gradual that by the time it has been finished the expenditure of energy necessary for it is also dissipated.[1]

It is tempting to go on from this conjecture about the work of mourning and try to give an account of the work of melancholia. Here we are met at the outset with an uncertainty. So far we have hardly considered melancholia from the topographical point of view, nor asked ourselves in and between what psychical systems the work of melancholia goes on.
[256] What part of the mental processes of the disease still takes place in connection with the unconscious object cathexes that have been given up, and what part in connection with their substitute, by identification, in the ego?

The quick and easy answer is that 'the unconscious (thing) presentation[2] of the object has been abandoned by the libido'. In reality, however, this presentation is made up of innumerable single impressions (or unconscious traces of them), and this withdrawal of libido is not a process that can be accomplished in a moment, but must certainly, as in mourning, be one in which progress is long drawn out and gradual.

1 The economic standpoint has hitherto received little attention in psychoanalytic writings. I would mention as an exception a paper by Victor Tausk (1913*a*) on motives for repression devalued by recompenses.

2 ['*Dingvorstellung*.' See p. 177 *n*. above and *RSE*, **24**, 97–8.]

Whether it begins simultaneously at several points or follows some sort of fixed sequence is not easy to decide; in analyses it often becomes evident that first one and then another memory is activated, and that the laments which always sound the same and are wearisome in their monotony nevertheless take their rise each time in some different unconscious source. If the object does not possess this great significance for the ego – a significance reinforced by a thousand links – then, too, its loss will not be of a kind to cause either mourning or melancholia. This characteristic of detaching the libido bit by bit is therefore to be ascribed alike to mourning and to melancholia; it is probably supported by the same economic situation and serves the same purposes in both.

As we have seen, however [p. 224 above], melancholia contains something more than normal mourning. In melancholia the relation to the object is no simple one; it is complicated by the conflict due to ambivalence. The ambivalence is either constitutional, i.e. is an element of every love relation formed by this particular ego, or else it proceeds precisely from those experiences that involved the threat of losing the object. For this reason the exciting causes of melancholia have a much wider range than those of mourning, which is for the most part occasioned only by a real loss of the object, by its death. In melancholia, accordingly, countless separate struggles are carried on over the object, in which hate and love contend with each other; the one seeks to detach the libido from the object, the other to maintain this position of the libido against the assault. The location of these separate struggles cannot be assigned to any system but the *Ucs*., the region of the memory traces of *things* [*sachlichen*] (as contrasted with [257]
word cathexes). In mourning, too, the efforts to detach the libido are made in this same system; but in it nothing hinders these processes from proceeding along the normal path through the *Pcs*. to consciousness. This path is blocked for the work of melancholia, owing perhaps to a number of causes or a combination of them. Constitutional ambivalence belongs by its nature to the repressed; traumatic experiences in connection with the object may have activated other repressed material. Thus everything to do with these struggles due to ambivalence remains withdrawn from consciousness, until the outcome characteristic of melancholia has set in. This, as we know, consists in the threatened libidinal cathexis at length abandoning the object, only, however, to draw back to the place in the ego from which it had proceeded. So by taking flight into the ego love escapes extinction. After this regression of the libido the process can become conscious, and it is

represented to consciousness as a conflict between one part of the ego and the critical agency.

What consciousness is aware of in the work of melancholia is thus not the essential part of it, nor is it even the part which we may credit with an influence in bringing the ailment to an end. We see that the ego debases itself and rages against itself, and we understand as little as the patient what this can lead to and how it can change. We can more readily attribute such a function to the *unconscious* part of the work, because it is not difficult to perceive an essential analogy between the work of melancholia and of mourning. Just as mourning impels the ego to give up the object by declaring the object to be dead and offering the ego the inducement of continuing to live [p. 228 above], so does each single struggle of ambivalence loosen the fixation of the libido to the object by disparaging it, denigrating it and even as it were killing it. It is possible for the process in the *Ucs*. to come to an end, either after the fury has spent itself or after the object has been abandoned as valueless. We cannot tell which of these two possibilities is the regular or more usual one in bringing melancholia to an end, nor what influence this termination has on the future course of the case. The ego may enjoy in this the satisfaction of knowing itself as the better of the two, as superior to the object.

Even if we accept this view [*Auffassung*][T] of the work of melancholia,
[258] it still does not supply an explanation of the one point on which we were seeking light. It was our expectation that the economic condition for the emergence of mania after the melancholia has run its course is to be found in the ambivalence which dominates the latter affection; and in this we found support from analogies in various other fields. But there is one fact before which that expectation must bow. Of the three preconditions of melancholia – loss of the object, ambivalence and regression of libido into the ego – the first two are also found in the obsessional self-reproaches arising after a death has occurred. In those cases it is unquestionably the ambivalence which is the driving force [*Triebfeder*] of the conflict, and observation shows that after the conflict has come to an end there is nothing left over in the nature of the triumph of a manic state of mind. We are thus led to the third factor as the only one responsible for the result. The accumulation of cathexis which is at first bound and then, after the work of melancholia is finished, becomes free and makes mania possible must be linked with regression of the libido to narcissism. The conflict within the ego, which melancholia substitutes for the struggle over the object, must act like a painful wound which calls for an extraordinarily high anticathexis. – But here once

again, it will be well to call a halt and to postpone any further explanation of mania until we have gained some insight into the economic nature, first, of physical pain, and then of the mental pain which is analogous to it.[1] As we already know, the interdependence of the complicated problems of the mind forces us to break off every enquiry before it is completed – till the outcome of some other enquiry can come to its assistance.[2]

1 [See footnote 1, p. 130 above.]

2 [*Footnote added* 1925:] Cf. a continuation of this discussion of mania in *Group Psychology and the Analysis of the Ego* (1921*c*) [*RSE*, **18**, 122–4].

OVERVIEW OF THE TRANSFERENCE NEUROSES

(1985 [1915])

EDITOR'S INTRODUCTION

ÜBERSICHT DER ÜBERTRAGUNGSNEUROSEN

GERMAN EDITIONS

1985 In *Übersicht der Übertragungsneurosen: Ein bisher unbekanntes Manuskript*, edited and with an essay by Ilse Grubrich-Simitis, 65–81 (facsimile with transcription, 14–59). Frankfurt: S. Fischer Verlag.

1987 *GW*, **Nachtr.**, 634–51.

ENGLISH TRANSLATION

1987 In *A Phylogenetic Fantasy: Overview of the Transference Neuroses*, edited as above, 5–20. Cambridge, MA, and London: The Belknap Press of Harvard University Press. (Tr. Axel Hoffer and Peter T. Hoffer.)

The present translation is a version of the one published in 1987, heavily modified by Mark Solms. The editorial apparatus, including the Editor's Introduction, was provided by Ilse Grubrich-Simitis. It was translated from the German by Albert Dickson. – The Editor of the *RSE*, Mark Solms, made light additions, e.g. the superscript [T]s and the marginalia (see p. ix above), to integrate this work into the general scheme of the edition as a whole.

In the Editors' Introduction to 'Papers on Metapsychology' (pp. 93–5 above) the significance and fate of the twelve metapsychological essays written in 1915 is described. Only five of them appeared in the *Internationale Zeitschrift für Psychoanalyse* in 1915 and 1917, respectively (1915*c*, 1915*d*, 1915*e*, 1916–17*f* [1915], 1916–17*g* [1915]). The remaining seven were never published by Freud; and their manuscripts were all considered lost.

However, in connection with preliminary studies for the publication of the correspondence between Sigmund Freud and Sándor Ferenczi in 1983, Ilse Grubrich-Simitis found in London, among papers that had passed from Ferenczi to Michael Balint, the draft of the last (twelfth) metapsychological paper. The manuscript was in an envelope addressed to Ferenczi, with whom Freud corresponded regularly about his metapsychological project during the war. Written in ink on both sides of the sheets, it measures 21.3 x 33.7 cm.[1]

1 Cf. 'Note on the Facsimile' in the first English edition of 1987 (p. 23; first German ed., 1985, p. 13).

A letter from Freud, written on the last page of the manuscript, facilitated its identification. It reads as follows:[1]

28.7.1915

Dear friend,

I am sending you herewith the draft of the XII [paper], which will certainly interest you. You can throw it away or keep it. The fair copy follows it sentence by sentence, deviating from it only slightly. Pages 21–23 have been added since your letter, which I had waited for. Fortunately, I had anticipated your excellent criticism.[2]

I will take a break now, before I finally work out *Cs.* and Anxiety. I am suffering greatly from Karlsbad ailments.[3]

Warm regards,

Your Freud

From the draft of an 'Overview of the Transference Neuroses' which, as mentioned in the accompanying letter, follows the fair copy 'sentence by sentence', we now obtain detailed knowledge of the content of this synthesis.

The draft is clearly divided into two parts. The first part, made up in keywords, contains a systematic comparison of the factors operative in the three transference neuroses. It corresponds to the title of the draft. Freud is covering familiar ground here. As he himself emphasizes, his findings are built on 'careful and arduous observation' (p. 245 below). They refer to the ontogenetic level. From the sixth factor – the part played by inherited disposition in the aetiology of the neuroses – there then follows, in a rush as it were, the second part, namely a highly speculative phylogenetic reconstruction, which is almost fully formulated in the manuscript. This reconstruction, which, in fact, goes beyond the title of the paper, obliged Freud to include the narcissistic neuroses, the psychoses. In this innovative part, he discusses several ideas that he did not take up again in his later works. To these belongs the question of whether that which nowadays strikes one as pathological and life-restrictive in the inner world of the neurotic and psychotic could once, in its evolutionary origins, have been the adaptive reaction of the species (necessary for survival) to threatening changes in the external conditions of life and to traumatic events – so that, in this early epoch of phylogeny, 'all human beings were the way only some of them are today' (p. 247 f.).

From the correspondence between Freud and Ferenczi it emerges that, during the months when the twelve metapsychological papers were nascent, Ferenczi was Freud's most important companion for discussion; Freud regarded him as the most

1 This letter is reproduced, also in facsimile, in the first English edition of 1987 (p. 71; first German ed., p. 61).

2 The last two sentences refer to questions and objections raised by Ferenczi to a previous sketch in a letter, dated July 12, 1915, in which Freud informed his friend in advance of the phylogenetic ideas developed in the second part of the paper and asked for his opinion. (Reproduced in the first English edition of 1987, p. 79; first German ed., p. 89 f.)

3 Intestinal complaints. '*Cs.* [consciousness] and Anxiety' refers to the topics of two of the other missing papers.

competent biologist among his students. Ferenczi's paper, 'Stages in the Development of the Sense of Reality' (1913*c*), which is mentioned in the 'Overview of the Transference Neuroses', was obviously the stimulus for Freud's 'phylogenetic phantasy'.[1] Moreover, Ferenczi was preoccupied at that time with comprehensive speculations, which he alternately termed 'palaeobiological', 'bioanalytic' or 'metabiological', and he held a lively exchange of ideas with Freud about them. Not long after writing the twelfth metapsychological paper, Freud considered undertaking, together with Ferenczi, a large-scale study on Lamarckism and psychoanalysis, but the plan was given up even before the end of the war. Traces of the two friends' discussion during the war years, centring on biological topics, can still, however, be found in *Beyond the Pleasure Principle* (1920*g*), *RSE*, **18**, and in Ferenczi's *Thalassa: A Theory of Genitality* (1924).

The connection which exists between the 'Overview of the Transference Neuroses' and one of his earlier works – *Totem and Taboo* (1912–13*a*) – was emphasized by Freud himself. In the fourth essay of this book he spoke of the 'great event with which civilization began and which, since it occurred, has not allowed mankind a moment's rest' (*RSE*, **13**, 133): the murder of the tyrannical father of the primal horde by his sons, expelled out of jealousy. In many respects, the phylogenetic phantasy of the 'Overview of the Transference Neuroses' is actually a variation on the theme touched upon in *Totem and Taboo*.

As is known, Freud held steadfastly to his hypothesis of the murder of the primal father,[2] despite the criticisms that had already become audible during his lifetime, particularly from the ranks of cultural anthropologists. Also the objections of biologists to the existence of a Lamarckian mode of inheritance had likewise not escaped him, but, to the end, these could not move him to give up his conviction that 'the archaic heritage of human beings comprises not only dispositions but also contents – memory traces of the experience of earlier generations'.[3]

It was therefore not so much these Lamarckian (or rather psycho-Lamarckian) parts of his metapsychology, which also by the present state of knowledge are problematical, that prevented Freud from publishing the 'Overview of the Transference Neuroses'. Rather, his doubts probably related, above all, to the more clinical first part. This was presumably rejected for the same reasons as the six other unpublished metapsychological essays. When, after the First World War, it was possible to publish, Freud obviously could no longer regard these manuscripts, written years before, as a successful synthesis of his theoretical views. (See Editors' Introduction, p. 94 above.)

For the presentation of the draft in this edition: The manuscript contains a profusion of abbreviated words. In the interest of readability, these have tacitly been completed.[4] Only where such completions could not be made with certainty have they

1 The second part of the twelfth paper is occasionally so termed in the Freud/Ferenczi correspondence (for example, in Freud's letter of July 18, 1915).

2 See, for example, *Group Psychology and the Analysis of the Ego* (1921*c*), *RSE*, **18**, 114 ff. and 126 f., *Civilization and its Discontents* (1930*a*), ibid., **21**, 91 and 117 ff., and *Moses and Monotheism* (1939*a*), ibid., **23**, 118 ff.

3 *Moses and Monotheism* (1939*a*), ibid., **23**, 91. Cf. also *An Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, 150 and 186.

4 For a facsimile of the original manuscript and a literal transcription of the draft, cf. the first English edition of 1987, pp. 24–68 (first German ed., pp. 14–58).

been identified as editorial amplifications by means of square brackets. Retained are those abbreviated formulae characteristic of Freud, such as '*Ucs.*', '*Pcs.*' and '*Cs.*'. On the other hand, the keyword character of the original, particularly in the systematic first part, ought not to be obscured by the editorial addition of words or phrases; after all, it is a question of a draft and not a fair copy. Only in a few places has clarification been given through brief insertions. These are identified by square brackets, not least because they are occasionally hardly more than conjectures.[1] Attention is drawn in footnotes to several peculiarities of the autograph, again in square brackets.

1 Since the 1985–87 editions, some corrections to these insertions have been made for the *RSE*.

OVERVIEW OF THE TRANSFERENCE NEUROSES

Preliminaries

After detailed investigation,[1] attempt to summarize characteristics, distinguish from others, comparative survey of the individual factors.[2] Factors are repression [*Verdrängung*][T], anticathexis [*Gegenbesetzung*][T], substitutive and symptom-formation [*Ersatz- und Symptombildung*], relation to the sexual function [*Sexualfunktion*][T], regression, disposition.[3] Restricted to the three types: anxiety hysteria, conversion hysteria and obsessional neurosis.

Besetzung

Sex

(*a*) *Repression*[4] takes place in all three types at the border of the *Ucs*. and *Pcs*. systems; consists in the withdrawal or renunciation [of the] *Pcs*. cathexis; is secured by means of a kind of anticathexis. In later stages of obsessional neurosis is displaced to the border between *Pcs*. and *Cs*.

Will hear that in the next group[5] repression has a different topography; it then extends to the concept of splitting.

1 [In the missing metapsychological papers that dealt with anxiety hysteria, conversion hysteria and obsessional neurosis.]

2 [In 'Repression' (1915*d*) and 'The Unconscious' (1915*e*) five of the six factors are already dealt with, more or less fully. At the end of 'Repression' (p. 137 ff. above), there is even a comparative description of the process of repression in the three transference neuroses. See also the comparison at the end of Section IV of 'The Unconscious' (p. 161 ff. above). For a later discussion of the distinguishing factors in the transference neuroses, cf. *Inhibitions, Symptoms and Anxiety* (1926*d*), *RSE*, **20** – for example, Chapter V regarding symptom-formation, and Chapter XI (A) in respect of anticathexis.]

3 [Originally, 'anticathexis' (*Gegenbesetzung*) was the third item in this sequence; by means of an insertion line Freud moved the word to the second position.]

4 [Here it is still a matter of the broader use of the concept of repression, in the general sense of defence. It was only later (1926*d*) that Freud used 'repression' to denote the defence mechanism specific to hysteria. This limited sense is already hinted at in 'Repression' (p. 136 above). Cf. the Editors' Note, p. 128 above.]

5 [This probably refers to the psychoses (or, in Freud's then usage, the narcissistic neuroses), mentioned in the second part of the draft but admittedly not described in more detail in relation to the specific processes of defence. See 'A Metapsychological Supplement to the Theory of Dreams' (1916–17*f* [1915]), p. 207 ff. above.]

Topographical point of view should not be overestimated in the sense that perhaps all interchange between the two systems is interrupted by it. The elements at which this barrier is introduced thus become more important.

Success and completeness [of repression] go together insofar as failure necessitates further efforts. Success varies with the three neuroses and in their individual stages.

Least success with anxiety hysteria; is confined to the fact that no *Pcs.* (and *Cs.*) representation [*Repräsentanz*] comes about. Later [to the fact] that instead of the offensive [idea], a substitutive [idea] becomes *pcs.* and *cs.* Finally, in the formation of phobias it achieves its aim, by inhibiting [*Hemmung*]^{T} the affect of unpleasure [*des Unlustaffekts*]^{T} through great renunciation and extensive attempt at flight. Purpose of repression is always avoidance of unpleasure. Fate [*Schicksal*]^{T} of the representative [of the repressed idea] is only an indication of the process. The apparent[1] separation into idea [*Vorstellung*]^{T} and affect (representational and quantitative factor) of the process to be defended against results from the very fact that repression consists in the renunciation of the word presentation [*Wortvorstellung*], thus from [the] topographical character of repression.

Unlust

In obsessional neurosis success is at first complete but not lasting. Process still less complete. After first successful phase it continues through two additional ones, the first of which (secondary repression,[2] formation of the obsessional idea, struggle against obsessional idea) is content, as [in] anxiety hysteria, with substitution of the representative, [the] later (tertiary [phase]) produces renunciations and restriction[s] that correspond to the phobia, but operates differently by means of logic.

In contrast to this, success of conversion hysteria is from the outset[3] complete, but at the cost of massive substitutive formation. Process of the individual events of repression more complete.

1 [At this point in the manuscript, hard to decipher, the words '*deskriptiv statt syst[ematisch]*' (descriptively instead of syst[ematically]) have been inserted between the lines, a formulation that Freud also uses in 'The Unconscious' to distinguish the two senses of 'unconsciousness' (p. 152 f. above). See the Editors' Note to this paper, p. 145 above.]

2 [The further items up to the closing parenthesis are located in the manuscript at the end of the section, just before (*b*); evidently added afterwards, they were clearly transposed to the indicated position by means of a line.]

3 [In the manuscript there is an erroneous repetition of *ein* instead of *an* ('*von Anfang an*').]

(b) Anticathexis[1]

In anxiety hysteria, absent at first[,] simple attempt at flight, then directed at substitutive idea and, especially in third phase, at its surroundings, in order from there to secure control of a release of unpleasure, through[2] vigilance and attentiveness. Represents the portion of the *Pcs*. [cathexis]; in other words, the expenditure that neurosis extracts.

In obsessional neurosis, where from the outset defence [*Abwehr*]^{T} against an ambivalent drive [*Trieb*]^{T} is at issue, it provides for the first successful repression, then achieves reaction-formation thanks to the ambivalence, then in the tertiary phase results in the attentiveness that characterizes obsessional ideas, and does the logical work. Thus second and third phase just as in anxiety hysteria. Difference in first phase, where [the anticathexis] in anxiety hysteria accomplishes nothing, in obsessional neurosis everything.

Always it secures for repression [the] corre[sponding] portion of the *Pcs*. In [conversion] hysteria, successful[3] character is made possible by the fact that anticathexis seeks from the outset to join with drive cathexis and reaches a compromise with it, makes selective determination of representation.

(c) Substitutive and Symptom-Formation

Corresponds to the return [of the] repressed, failure of repression. [The two can be] separated for a while, later [the substitutive formation] fuses with it [the symptom-formation].

Most complete in the case of conversion hysteria: substitute = symptom, nothing further to be separated.

Likewise in anxiety hysteria, substitutive formation makes possible the first return of the repressed.

In obsessional neurosis [substitutive formation] sharply separated [from symptom-formation] in that first substitutive formation is delivered from the repressed by means of anticathexis and is not counted among symptoms. Whereas [the] later symptoms of obsessional neurosis often predominantly consist in return of the repressed; role of the repression smaller in them.

Symptom-formation, from where our investigation starts, always

1 [Here the manuscript has written and crossed out: '*Ersatz u Symptombildg.*' (substitutive and symptom-formation). Apparently Freud decided at this point in the writing of the draft to treat anticathexis before substitutive and symptom-formation. See the corresponding inversion in the series at the beginning of the paper.]

2 [This word cannot be deciphered with certainty.]

3 [Nor can this word be deciphered with certainty.]

coincides with return of the repressed and occurs with the aid of regression and the disposing fixations. A general law states that the regression goes back to the fixation and from there return of the repressed asserts itself.

(d) Relation to the Sexual Function

Regung What remains constant here is that repressed drive impulse [*Triebregung*]^{T} is always a libidinal one, belonging to sexual life, whereas repression proceeds from the ego [*Ich*]^{T} out of various motives [*Motiven*]^{T}, which can be summed up as a not-being-able-to (because of excessive strength) or a not-wanting-to. The latter goes back to incompatibility with the ego ideals or to other kinds of feared injury to the ego. The not-being-able-to also corresponds to an injury.

This fundamental fact is obscured by two factors. First, it often seems as though repression is aroused by conflict between two impulses, both [of which] are libidinal. This is resolved by considering that one of them is ego-syntonic [*ichgerecht*]^{T} and can enlist the aid of the repression that emanates from the ego in the conflict. Second, by virtue of the fact that not only libidinal but also ego strivings are encountered among the repressed, especially frequently and distinctly in the case of neuroses of longer duration and more advanced development. [The] latter comes about in such a way that the repressed libidinal impulse seeks to assert itself in a roundabout way by means of an ego aim to which it has lent a component, it transfers [*überträgt*] energy to it, and now drags this [ego aim] down into repression, which can occur on a large scale. Nothing in the general validity of the former statement is thereby altered. Understandable requirement that one [should] gather insights from the beginning stages of the neuroses.

[It is] evident in hysteria and obsessional neurosis that repression directs itself towards the sexual function in definitive form, in which it represents reproductive urge. Most distinct again in conversion hysteria, because without complications, in obsessional neurosis preceded by regression. But also not exaggerate this connection, for instance, not assume that repression only comes into effect with this stage of the libido. On the contrary, it is precisely obsessional neurosis that shows that repression [is a] general process, not libidinally dependent, because here directed against preliminary stage. Likewise in development where repression is also taken up against perverse impulses. Question: Why does repression succeed here, not elsewhere? In nature

libidinal strivings very capable of representation, so that with repression of the normal, the perverse is strengthened, and *vice versa*. Repression [has] no relation to the sexual function other than defence, like regression and other drive vicissitudes.

In anxiety hysteria the relation to the sexual function is less distinct, for reasons that have become apparent in the treatment of anxiety. Seems that anxiety hysteria encompasses those cases in which demands of sexual drive [are] defended against as too great, like danger. No special conditions from libidinal organization.

(e) Regression

The most interesting factor and drive vicissitude. No occasion to divine [*erraten*] it from anxiety hysteria. Could say that [it] does not come into consideration here, perhaps because every later anxiety hysteria so clearly regresses to an infantile one (the typical disposition of neurosis), and this latter one appears so early in life. On the other hand, both of the other [transference neuroses are] most beautiful examples of regression, but in each it plays a different role in structure of the neurosis. In conversion hysteria it is a strong ego regression, return to phase without separation of *Pcs*. and *Ucs*., thus without language and censorship. Regression, however, serves symptom-formation and return of the repressed. The drive impulse that [is] not accepted by the current ego returns to an earlier stage, through which it is discharged, although in another manner. That it virtually amounts to a kind of libidinal regression in the process [has] already [been] mentioned. It is different in obsessional neurosis. The regression is a libidinal regression, does not serve the return [of the repressed], but rather repression, and is made possible by a powerful constitutional fixation [*Fixierung*][T] or incomplete development. In fact, here the first phase of defence is assigned to regression, where it is more a case of regression than inhibition of development,[1] and the regressive libidinal organization is only subsequently subjected to a typical repression – which, however, remains unsuccessful. A piece of ego regression is forced upon [the] ego by the libido or occurs in the incomplete development of the ego, which here is connected to libidinal phase. (Separation of ambivalences.)

1 [This obscure clause seems to make more sense by positioning its elements differently: 'where it is a case of more than [a] regression to [an] inhibition of development'.]

(f) [*Disposition*[1]]

Behind regression are hidden the problems of fixation and disposition. In general it can be said that regression proceeds all the way back to a fixation point, in either ego or libidinal development, and this represents the disposition.[2] This is therefore the most decisive factor, the one that mediates the decision concerning choice of neurosis.[3] [It is] worthwhile, therefore, to dwell on it. Fixation comes about through phase of development that was too pronounced or perhaps persisted too long to proceed into the next without residue. [It] would be best if [we] did not demand [a] clearer idea of what, in what changes, fixation consists. But say something about [its] origin. The possibility also exists that such fixation is brought along in pure form and also that it [is] produced by early impressions and, in the end, that both factors work together. All the more since it can be claimed that both elements are actually ubiquitous, insofar as [on the one hand] all dispositions are constitutionally present in the child and, on the other hand, the operative impressions are allotted to large numbers of children in like manner. Is thus a case of more or less, and of an effective combination. Because no-one is inclined to dispute constitutional factors, it devolves upon psychoanalysis to defend equally forcefully the claims of early infantile acquisitions.[4] In obsessional neurosis, incidentally, the constitutional factor is admittedly far more clearly recognized than is the accidental in conversion hysteria. Detailed assessment still doubtful.

When the constitutional factor of fixation comes into consideration, acquisition [is] not thereby eliminated; it merely retreats into still earlier prehistory, since it can justifiably be claimed that the inherited dispositions are residues of ancestral acquisition. We hereby come upon [the] problem of the phylogenetic disposition behind the individual or ontogenetic [one], and should find no contradiction if the individual adds new dispositions from his own experience to his inherited disposition [passed down] on the basis of earlier experience. Why should the process

1 [This factor, from which Freud, as it were, opens up the phylogenetic dimension of the second part of this 'Overview of the Transference Neuroses', is hardly mentioned in the published metapsychological papers of 1915; cf., however, the last paragraph of Section VI in 'The Unconscious', p. 172 above.]

2 [In 'The Disposition to Obsessional Neurosis' (1913*i*), *RSE*, **12**, 314, Freud declares plainly: 'Thus our dispositions are inhibitions in development.']

3 [The problem of the choice of neurosis, which had already preoccupied Freud in the 1890s, was always viewed by him from an evolutionary perspective. See again, for example, 'The Disposition to Obsessional Neurosis', ibid., **12**, 313 ff.]

4 [Freud had already expressed his opinion on the topic of constitution versus experience similarly in a letter to Else Voigtländer dated October 1, 1911 (1960*a*).]

that creates disposition on the basis of experience cease precisely at the individual whose neurosis one is investigating? Or [why should] this [individual] create disposition for his progeny but not be able to acquire it for himself? Seems rather [to be a] necessary complement.

The extent to which phylogenetic disposition can contribute to our understanding of the neuroses cannot yet be estimated. The fact that consideration goes beyond narrow field of the transference neuroses also needs to be included. In any event, most important distinguishing feature of the transference neuroses could not be acknowledged in this overview, as it does not stand out when they are compared with one another and would only become evident by way of contrast with the narcissistic neuroses.[1] With this widening of the horizon [the] relation of ego to object would shift [into the] foreground, and clinging on to the object would turn out to be [the] common distinguishing feature. Certain preliminaries permitted here.

Hope the reader, not least through boredom over many sections, has noticed how everything is based on very careful and arduous observation, will be patient if criticism occasionally gives way to phantasy and unconfirmed things are presented, merely because they are stimulating and open up remote vistas.

It is still legitimate to assume that the neuroses must bear witness also to the history of the mental development of mankind.[2] Now I believe I have shown in [the] paper (On the Two Principles[3]) that we must ascribe a different development to man's sexual strivings and ego strivings.[4] The reason [is] essentially that the former can be satisfied auto-erotically for quite some time, whereas ego strivings are directed from the beginning towards object and thereby towards reality. [As for] the development of human sexual life, we believe we have learnt to understand it in broad

1 [Two crossed-out fragments of sentences follow in the manuscript: '*Er liegt in der Festhaltung des Objekts. Verhältnis des Ich zum Objekt*.' ('It lies in the holding on to the object. Relation of the ego to the object.')]

2 [In the contemporaneous *Introductory Lectures on Psychoanalysis* (1916–17*a* [1915–17]) Freud wrote in connection with primal phantasies: 'I have repeatedly been led to suspect that the psychology of the neuroses has stored up in it more of the antiquities of human development than any other source' (*RSE*, **16**, 327). Cf. also 'From the History of an Infantile Neurosis' (1918*b*), ibid., **17**, 87, as well as *The Ego and the Id* (1923*b*), ibid., **19**, 32 f.]

3 ['Formulations on the Two Principles of Mental Functioning' (1911*b*), ibid., **12**.]

4 [As is already obvious from earlier passages, Freud still proceeds in the present draft from the dualism of the sexual/ego drives. Cf. the comments on the classification of drives in the Editors' Note, pp. 101–2 above.]

outline (*Three Essays on the Theory of Sexuality* [1905*d*][1]). The development of the human ego, that is, of the functions of self-preservation and the structures [*Bildungen*][T] derived from them, is more difficult to fathom. I know only the solitary attempt of Ferenczi [1913*c*] who makes use of psychoanalytic experience for this purpose. Our task would naturally be much easier if the developmental history of the ego were given to us from somewhere other than our understanding of the neuroses, instead of our having to proceed in the opposite direction.[2] One thereby gets the impression that the developmental history of the libido recapitulates a much older piece of [phylogenetic] development than that of the ego; the former perhaps recapitulates conditions of the phylum of vertebrates, whereas the latter is dependent on the history of the human race. Here there exists a series to which one can attach various far-reaching ideas. It begins with an arrangement of psychoneuroses (not the transference neuroses alone) according to the point in time at which they customarily appear in the life of the individual.[3] Then anxiety hysteria, almost without precondition, is the earliest, closely followed by conversion hysteria (from about the fourth year); somewhat later in prepubescent children (9–10) obsessional neurosis appears. The narcissistic neuroses are absent in childhood. Of these, dementia praecox in classic form is [an] illness of the pubertal years, paranoia approaches the years of maturity, and melancholia-mania in the same time frame, otherwise not specifiable.

The series is thus:

> anxiety hysteria – conversion hysteria – obsessional neurosis – dementia praecox – paranoia – melancholia-mania.

The dispositional fixations of these disorders also appear to form a series, but one which runs in the opposite direction, especially when

1 [In a letter to Sándor Ferenczi dated December 2, 1914, Freud plainly described the metapsychological papers as a 'continuation of the problems at which I stopped in the Theory of Sexuality'. At the time of writing the metapsychological series, Freud was preparing the third edition of the *Three Essays*. In the Preface to that edition, as well as in the additions to the text, the phylogenetic considerations adopted in connection with the metapsychological project are unmistakable.]

2 [This passage probably means: 'Our task of understanding the neuroses would naturally be much easier if the developmental history of the ego were given to us from somewhere else instead of our having to proceed in the opposite direction' (that is, inferring the developmental history of the ego from the investigation of the neuroses). Freud possibly added the phrase '*die Neurosen zu verstehen*' (of understanding the neuroses) in the continuing text afterwards, as was customary for him, but did not insert an arrow.]

3 [On the age of onset of the neuroses, cf. 'The Disposition to Obsessional Neurosis' (1913*i*), *RSE*, **12**, 314, and *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 101 f.]

libidinal dispositions are considered. The upshot would thus be that the later the neurosis appears, the earlier the phase of the libido to which it must regress. But this only holds true in general terms. Undoubtedly conversion hysteria is directed against primacy of the genitals, obsessional neurosis against the sadistic preliminary stage, all three transference neuroses against completed libidinal development. The narcissistic neuroses, however, reach back to phases preceding the finding of object; dementia praecox regresses as far as auto-erotism; paranoia as far as narcissistic homosexual object choice; melancholia is based on narcissistic identification with the object. The differences lie in the fact that dementia unquestionably appears earlier than paranoia, although its libidinal disposition extends farther back, and that melancholia-mania permit no definite ranking with respect to time. It can therefore not be maintained that the temporal sequence of the psychoneuroses, which certainly exists, was determined solely by the development of the libido. To the extent that this is the case, one would emphasize the inverse relationship between the two. It is also known that with advancing age hysteria or obsessional neurosis can turn into dementia; the opposite never occurs.

Another phylogenetic series can be constructed, however, which is really concurrent with the temporal sequence of the neuroses. In doing so, however, we must go far afield and allow some hypothetical intermediate links.

Dr Wittels[I] first expressed the idea that the primal human animal passed its existence in a thoroughly rich milieu that satisfied all needs, echoes of which we have retained in the myth of the primaeval paradise. There it may have overcome the periodicity of the libido, which is still inherent in mammals. Ferenczi, in the aforementioned thoughtful paper, then expressed the idea that the subsequent development of this primal human took place under the influence of the geological vicissitudes of the earth [*Erdschicksale*], and that the exigencies of the Ice Ages in particular gave it the stimulus for the development of civilization [*Kulturentwicklung*][T]. After all, it is generally conceded that the human race already existed at the time of the Ice Age and experienced its effects. *Kultur*

If we pursue Ferenczi's idea, the temptation is very great to recognize in the three dispositions to anxiety hysteria, conversion hysteria and obsessional neurosis regressions to phases that the whole human race had to go through at some time from the beginning to the end of the Ice Ages,[2] so that at that time all human beings were the way only some of

1 [Wittels (1912); see especially pp. 1–19.]

2 [In *The Ego and the Id* (1923*b*), in connection with superego formation, Freud returns to the significance of the Ice Ages for the development of civilization (*RSE*, **19**, 30 f.).]

them are today, by virtue of their hereditary tendency and by means of new acquisition. The pictures naturally do not coincide completely, because neurosis contains more than what is contributed by regression. It [neurosis] is also an expression of the struggle against this regression and a compromise between the primaevally old and the demands of the culturally new. This difference will have to be most starkly pronounced in obsessional neurosis, which stands under the sign of inner conflict like no other. But neurosis, insofar as the repressed has been victorious in it, must bring back the primaeval picture.

[(1)] Our first hypothesis would thus maintain that mankind, under the influence of the privations that the encroaching ice imposed on it, has become generally *anxious* [*ängstlich*][T]. The hitherto predominantly friendly outside world, which bestowed every satisfaction, was transformed into a mass of threatening perils. There was good reason for realistic anxiety about everything new. To be sure, sexual libido did not let go [of] its objects, which were certainly human; but it is conceivable that the ego, whose existence was threatened, to some extent abandoned object cathexis, retained the libido in the ego, and thus transformed into realistic anxiety what had previously been object libido. We see in infantile anxiety that when satisfaction is denied the child transforms object libido into realistic anxiety about strangers, but we also see that it is generally inclined to be fearful of anything new. We have carried on a long dispute over whether realistic anxiety or anxiety due to longing[1] is the earlier of the two; whether the child transforms his libido into realistic anxiety because he regards [it] as excessive and dangerous, and thus actually arrives at an idea of danger, or whether he rather yields to a general anxiousness and learns from this to fear also his unsatisfied libido. We were inclined to assume the former, to give precedence to anxiety due to longing, but a particular disposition was lacking. We had to explain it as a general infantile inclination. Now phylogenetic consideration seems to settle this dispute in favour of realistic anxiety and allows us to assume that a portion of children bring the anxiousness of the beginning of the Ice Ages along with them and are presently induced by it to treat unsatisfied libido as an external danger. The relative excess of libido would result from the same preconditions [*Anlage*], however, and thus make possible new acquisition of anxious disposition. Still, consideration of anxiety hysteria would support the preponderance of phylogenetic disposition over all other factors.

Angst

1 [The German term in the manuscript is '*Sehnsuchtsangst*'. It later reappears in *The Ego and the Id* (1923*b*), *RSE*, **19**, 52.]

(2) As the hard times progressed, primal humans, whose existence was threatened, must have been subjected to conflict between self-preservation and desire to procreate, which finds expression in most typical cases of hysteria. There was insufficient food to permit an increase in the human hordes, and the powers [*Kräfte*][T] of the individual were not adequate to keep so many helpless beings alive. The killing of newborns would certainly have been resisted by love, especially of the narcissistic mothers. Accordingly, it became a social obligation to limit reproduction. Perverse satisfactions that precluded the spawning of children escaped this prohibition, which promoted a certain regression of the libido to the phase preceding the primacy of the genitals. The limitation must have affected[I] women more severely than men, who were less concerned about the consequences of sexual intercourse. This whole situation obviously corresponds to the conditions of conversion hysteria. From its symptomatology we conclude that man was still speechless when, due to exigencies beyond his control, he imposed the prohibition of reproduction on himself; thus he also had not yet developed the system *Pcs.* over his *Ucs.* Those who are disposed to conversion hysteria then also regress to it, especially women, under the influence of prohibitions aimed at the elimination of the genital function, while intensely exciting early impressions press for genital activity.

(3) The subsequent evolution is easy to construct. It primarily affected the male.[2] After he had learnt to economize on his libido and degrade his sexual activity to an earlier phase by means of regression, the application of his intelligence became paramount for him. He learnt to a degree how to investigate and understand the hostile world, and how through invention to secure his first mastery over it. He developed himself under the sign of energy, formed the beginnings of language, and must have assigned great significance to his new acquisitions. Language was magic to him, his thoughts seemed omnipotent to him, and he understood the world on the model of his ego. This is the era of animism and its magical techniques. As a reward for his power to safeguard the lives of so many helpless others he bestowed upon himself unrestrained dominance over them, and through his personality established the first two laws: he himself was invulnerable and his possession of the women must not be

1 [At this point in the manuscript the word '*Abstinenz*' (abstinence) is inserted between the lines.]

2 [For Freud's later statements on sex-specific differences in the formation and structure of the superego, see *The Ego and the Id* (1923*b*), *RSE*, **19**, 32, 'Some Psychical Consequences of the Anatomical Distinction between the Sexes' (1925*j*), ibid., **19**, 257 f., and *New Introductory Lectures on Psychoanalysis* (1933*a*), ibid., **22**, 118 f.]

challenged. At the end of this epoch the human race had disintegrated into individual hordes that were dominated by a strong and wise, brutal man acting as father. It is possible that the egoistically jealous and inconsiderate nature[I] that we attribute on social-psychological grounds to the primal father of the human horde was not present from the beginning, but rather developed during the severe Ice Ages out of adaptation to its exigencies.

The characteristics of this phase of mankind are recapitulated in obsessional neurosis, albeit partly in a negative way, since it corresponds to the struggle against this return (reaction-formations).[2] The overemphasis on thinking, the enormous energy that returns in the form of compulsion, the omnipotence of thoughts and the inclination to inviolable laws are constant features. But against the brutal impulses that would replace love life, the resistance of later developments arises, which through libidinal conflict finally paralyses the life energy of the individual, and what remains is only the impulses in the form of compulsions that have been displaced [*verschoben*–][T] on to trivialities. So when this type of person, so valuable for the development of civilization [*Kulturentwicklung*] returns, he comes to grief from the demands of erotic life; just as the grandiose type of the primal father himself, who later returns as godhead, perished in reality from the filial relationships he created.

Verschiebung

(4) We might have come this far in completing the programme envisaged by Ferenczi 'to bring the neurotic types of regression into harmony with the stages of human phylogeny'[3] without straying into such risky speculations. However, we would have no clue to the subsequent narcissistic neuroses which appear later if we were not assisted by the assumption that the disposition to them had been acquired by a second generation, whose development introduces a new phase of human civilization.

This second generation begins with the sons, to whom the jealous father does not allow full scope. We have indicated elsewhere (*Totem and Taboo*)[4] that he drives them out when they reach the age of

1 [Cf. a passage in *Group Psychology and the Analysis of the Ego*, where Freud says of the father of the primal horde that 'his ego had few libidinal ties; he loved no-one but himself, or other people only insofar as they served his needs' (1921*c*), *RSE*, **18**, 115.]

2 [In the manuscript '*Reaktionsbild[un]gen*' (reaction-formations) is placed diagonally over '*diese Wiederkehr*' (this return). It is unclear where the word should be inserted.]

3 [Ferenczi (1913*c*, 236). The original wording reads somewhat differently.]

4 [Freud (1912–13*a*); see Editor's Introduction, p. 237 above. Cf. also Freud's late work *Moses and Monotheism* (1939*a*), *RSE*, **23**, 74–93, where this phylogenetic construction is taken up once more.]

puberty. Psychoanalytic experience teaches us, however, to substitute another, more gruesome solution – namely, that he robs them of their manhood after which they are able to stay in the horde as harmless labourers. We may imagine the effect of castration in that primaeval time as an extinguishing of the libido and a halt in individual development. Such a state seems to be recapitulated by dementia praecox which, especially in the form of hebephrenia results in an abandonment of all love objects, degeneration of all sublimations, and return to auto-erotism. The youthful individual behaves as though he had undergone castration. In fact, self-castrations are not uncommon with this disorder. The speech alterations and hallucinatory storms that otherwise characterize this disorder should not be drawn into the phylogenetic picture, since they represent attempts at cure, the numerous efforts to regain the object, which are [for a while][1] almost more noticeable in the clinical picture than the degenerative phenomena.

The assumption that the sons were treated in this way is related to a question that should be addressed in passing. Where does replacement of and succession to the primal fathers come from when they get rid of the sons in this way? Atkinson [1903][2] already showed the way when he pointed out that only the older sons had to fear the full persecution of the father; the youngest – schematically considered – had the prospect of eluding this fate and becoming the father's successor, thanks to the intercession of the mother, but mainly as a consequence of the father's ageing and his need for help. This advantage of the youngest was totally eliminated in the subsequent social configuration and was replaced with the prerogative of the oldest. In myth and fairy tale, however, it remains highly recognizable.

(5) The next change could only consist in the fact that the threatened sons avoided castration by means of flight and, allied with one another, learnt to take upon themselves the struggle for survival. This living together had to bring social feelings to the fore and could have been built upon homosexual satisfaction. It is very possible that the long-sought hereditary disposition to homosexuality can be found in the inheritance of this phase of the human condition. The social feelings that originated here, sublimated from homosexuality, became mankind's lasting possession, however, and the basis for every later society. But this phase is manifestly recapitulated in paranoia; or more

1 [The word '*Zeitlang*' (a while) is added in the margin. It is not clear where Freud intended to insert it.]

2 [Freud referred to Atkinson (1903) repeatedly in the fourth essay of *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 131 *n.* 2, in connection with his hypothesis of the murder of the primal father.]

correctly, paranoia defends against its return. There is no shortage of secret alliances in paranoia, and the persecutor plays a tremendous role. Paranoia is an attempt to ward off homosexuality, which was the basis for the organization of brothers, and in so doing it must drive the victim out of society and[1] destroy his social sublimations.

(6) Ranking melancholia-mania in this context seems to encounter the difficulty that a normal age of onset for this neurotic[2] illness cannot be precisely determined. Nevertheless it certainly belongs to the phase of maturity rather than that of childhood. Considering the characteristic alternation of depression and elation, it is difficult not to recall the very similar succession of triumph and mourning that forms a regular component of religious celebrations.[3] Mourning over the death of the god, triumphal joy over his resurrection. This religious ceremony, however, as we have surmised from the assertions of social psychology [*Völkerpsychologie*], only recapitulates in reverse the attitude of the members of the fraternal clan after they had overpowered and killed the primal father: triumph over his death, then mourning over the fact that they all still revered him as a model. This great event of human history, which put an end to the primal horde and replaced it with the victorious organization of brothers, might thereby provide the predisposition for the peculiar succession of moods that we recognize as a particular narcissistic disorder alongside the paraphrenias. The mourning of the primal father proceeds from an identification with him, and we have established that identification is the prerequisite for the mechanism of melancholia.[4]

To summarize, we can say: If the dispositions to the three transference neuroses were acquired in a struggle with the exigencies of the Ice Ages, then the fixations that underlie the narcissistic neuroses originate from oppression by the father, who after the end of the Ice Age assumes its role, continues it as it were,[5] against the second generation. As the first struggle leads to the patriarchal stage of civilization, so the second leads to the social; but from both of them arise the

1 [In the manuscript this '*und*' (and) is located at the end of the paragraph. Presumably Freud intended to enter it here, but there is no arrow.]

2 ['Neurotic' here is used, obviously, in the sense of psychoneurosis, not of transference neurosis.]

3 [On this, see Section 4, and particularly Section 5, in the fourth essay of *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 123 ff. and 129 ff.]

4 [In 'Mourning and Melancholia' (1916–17*g* [1915]).]

5 [This '*gleichsam*' (as it were), evidently jotted down later, is located in the left margin of the manuscript. There is no clear indication of where it belongs.]

fixations which in their return after millennia become the disposition of the two groups of neuroses. In this sense, too, therefore neurosis is a cultural acquisition. The parallel that has been sketched here may be no more than a playful comparison. The extent to which it may throw light on the still unsolved riddles of the neuroses should properly be left to further investigation and empirical clarification.[1]

Now it is time to think [about a] series of objections, which caution us not to overestimate the reconstructions we have arrived at. First, it [will be] obvious to everyone that the second series of dispositions, those of the second generation, can only be acquired by men (as sons), whereas dementia praecox, paranoia and melancholia can just as well be produced by women. Women in primordial times lived under even more diverse conditions than they do today. Furthermore, attached to these dispositions is a difficulty of which the first series is free: they appear to be acquired under conditions that exclude heredity. It is evident that the castrated and intimidated sons do not procreate; therefore they cannot pass on their disposition (dementia praecox). Similarly, the condition of the banished sons bound together in homosexuality cannot influence the next generations, for they die out as infertile branches of the family, as long as they have not triumphed over the father. But if they do achieve this triumph, then it is the experience of a generation that must be denied the necessary unlimited reproduction.

As can be imagined, we need not be at a loss for particulars in such obscure areas. The difficulty basically coincides with one that has been posed earlier, namely, how the brutal father of the Ice Age, who was certainly not immortal like his divine likeness, reproduced himself. Again the younger son appears, who later becomes a father – who actually is not castrated himself, but knows the fate of his older brothers and fears it for himself. He must have been tempted, like the more fortunate of them, to flee and renounce women. So next to these

1 [At this point in the autograph there is a longish horizontal line, Freud's sign for the end of the manuscript. What then follows is the addition announced in the accompanying letter (see p. 236 above) – a reaction to Ferenczi's letter of July 24, 1915, in which Ferenczi critically commented on Freud's earlier sketch of the phylogenetic phantasy, given in his letter of July 12, 1915. Ferenczi had raised the following questions: 'Only the analogy between dementia praecox and the castration phase is not clear to me. The castrated ones cannot have reproduced and fixated their condition phylogenetically; therefore you must surely mean the fixation of castration *anxiety*. To be sure, the loss of the mother could at first have resulted in complete helplessness and regression to narcissism on the part of the expelled sons. But the question is, how can this phase have been phylogenetically fixated? The fixation of homosexuality is equally enigmatic, unless one assumes that individual homosexuals remained bisexual and were able to reproduce. It would be the case that each of these phases brought about individual "criminals" who, unhindered by the prevailing current of the time, copulated normally with the woman (mother); (Oedipus, rape of the Sabine women.)']

infertile men who fall by the wayside, there may always be a chain of others, who in their persons undergo the vicissitudes of the male sex and can propagate them as dispositions. The essential point of view remains that for him [the younger son] the oppression of the father replaces the exigencies of the era.

Triumph over the father must have been planned and phantasized through countless generations before it was realized. How the dispositions produced by the father's oppression spread to women seems to cause greater difficulties. The vicissitudes of women in these primaeval times are especially obscure to us. Thus, conditions of life that we have not recognized may come into consideration. But we are spared the grossest difficulty by recalling human bisexuality. Thus women can assume the dispositions acquired by men and express them in themselves.

Meanwhile let us be clear that with these particulars we have essentially done no more than save our scientific phantasies from the criticism of being absurd. On the whole, they retain their value as a salutary tempering of our possible inclination to place the phylogenetic disposition above everything else. Thus it does not happen that archaic constitutions return in new individuals according to a predetermined ratio, and push them into neurosis through conflict with current demands. Room remains for new acquisition and for influences with which we are not acquainted. In sum, we are not at the end, but rather at the beginning of an understanding of this phylogenetic factor.

APPENDIX

LIST OF WRITINGS BY FREUD DEALING MAINLY WITH GENERAL PSYCHOLOGICAL THEORY

The date at the beginning of each entry is that of the year during which the work in question was probably written. The date at the end is that of publication; and under that date fuller particulars of the work can be found in the Bibliography. The items in square brackets were published posthumously. [259]

The present translation is a revised and corrected reprint of the *SE* version.

The case history presented in this paper serves as a confirmation of the view put forward by Freud in his Schreber analysis (1911*c*), *RSE*, **12**, that there is a close connection between paranoia and homosexuality. It is incidentally an object lesson to practitioners on the danger of basing a hasty opinion of a case on a superficial knowledge of the facts. The last few pages contain some interesting remarks of a more general kind on the processes at work during a neurotic conflict.

A CASE OF PARANOIA RUNNING COUNTER TO THE PSYCHOANALYTIC THEORY OF THE DISEASE

Some years ago a well-known lawyer consulted me about a case which [263]
had raised some doubts in his mind. A young woman had asked him to protect her from the molestations of a man who had drawn her into a love affair. She declared that this man had abused her confidence by getting unseen witnesses to photograph them while they were making love, and that by exhibiting these pictures it was now in his power to bring disgrace on her and force her to resign the post she occupied. Her legal adviser was experienced enough to recognize the pathological stamp of this accusation; he remarked, however, that, as what appears to be incredible often actually happens, he would appreciate the opinion of a psychiatrist in the matter. He promised to call on me again, accompanied by the plaintiff.

(Before I continue the account, I must confess that I have altered the milieu of the case in order to preserve the incognito of the people concerned, but that I have altered nothing else. I consider it a wrong practice, however excellent the motive may be, to alter any detail in the presentation of a case. One can never tell what aspect of a case may be picked out by a reader of independent judgement, and one runs the risk of leading him astray.)[1]

Shortly afterwards I met the patient in person. She was thirty years old, a most attractive and handsome girl, who looked much younger than her age and was of a distinctly feminine type. She obviously resented the interference of a doctor and took no trouble to hide her distrust. It was clear that only the influence of her legal adviser, who was present, induced her to tell me the story which follows and which set me a problem that will be mentioned later. Neither in her manner nor by any kind [264]
of expression of emotion did she betray the slightest shame or shyness, such as one would have expected her to feel in the presence of a

1 [Cf. a footnote to the same effect added in 1924 at the end of Freud's case history of 'Katharina' in Breuer & Freud, *Studies on Hysteria* (1895*d*), *RSE*, **2**, 119 *n.*, and some remarks in the Introduction to the 'Rat Man' case history (1909*d*), ibid., **10**, 119–20.]

stranger [*fremden Zuhörer*]^{t}. She was completely under the spell of the apprehension brought on by her experience.

For many years she had been on the staff of a big business concern, in which she held a responsible post. Her work had given her satisfaction and had been appreciated by her superiors. She had never sought any love affairs with men, but had lived quietly with her old mother, of whom she was the sole support. She had no brothers or sisters; her father had died many years before. Recently an employee in her office, a highly cultivated and attractive man, had paid her attentions and she in turn had been drawn towards him. For external reasons, marriage was out of the question, but the man would not hear of giving up their relationship on that account. He had pleaded that it was senseless to sacrifice to social convention all that they both longed for and had an indisputable right to enjoy, something that could enrich their life as nothing else could. As he had promised not to expose her to any risk, she had at last consented to visit him in his bachelor rooms in the daytime. There they kissed and embraced as they lay side by side, and he began to admire the charms which were now partly revealed. In the midst of this idyllic scene she was suddenly frightened by a noise, a kind of knock [*Pochen*]^{t} or click. It came from the direction of the writing desk, which was standing across the window; the space between desk and window was partly taken up by a heavy curtain. She had at once asked her friend what this noise meant, and was told, so she said, that it probably came from the small clock on the writing desk. I shall venture, however, to make a comment presently on this part of her narrative.

As she was leaving the house she had met two men on the staircase, who whispered something to each other when they saw her. One of the strangers was carrying something which was wrapped up and looked like a small box. She was much exercised over this meeting, and on her way home she had already put together the following notions: the box might easily have been a camera, and the man a photographer who had been hidden behind the curtain while she was in the room; the click had been the noise of the shutter; the photograph had been taken as soon as he saw her in a particularly compromising position which he wished to record. [265] From that moment nothing could abate [*zum Schweigen*]^{t} her suspicion of her lover. She pursued him with reproaches and pestered him for explanations and reassurances, not only when they met but also by letter. But it was in vain that he tried to convince her that his feelings were sincere and that her suspicions were entirely without foundation. At last she called on the lawyer, told him of her experience and handed over the

letters which the suspect had written to her about the incident. Later I had an opportunity of seeing some of these letters. They made a very favourable impression on me, and consisted mainly in expressions of regret that such a beautiful and tender relationship should have been destroyed by this 'unfortunate morbid idea'.

I need hardly justify my agreement with this judgement. But the case had a special interest for me other than a merely diagnostic one. The view had already been put forward in psychoanalytic literature that patients suffering from paranoia are struggling against an intensification of their homosexual trends – a fact pointing back to a narcissistic object choice. And a further interpretation had been made: that the persecutor is at bottom someone whom the patient loves or has loved in the past.[1] A synthesis of the two propositions would lead us to the necessary conclusion that the persecutor must be of the same sex as the person persecuted. We did not maintain, it is true, as universally and without exception valid the thesis that paranoia is determined by homosexuality; but this was only because our observations were not sufficiently numerous; the thesis was one of those which in view of certain considerations become important only when universal application can be claimed for them. In psychiatric literature there is certainly no lack of cases in which the patient imagines himself persecuted by a person of the opposite sex. It is one thing, however, to read of such cases, and quite a different thing to come into personal contact with one of them. My own observations and analyses and those of my friends had so far confirmed the relation between paranoia and homosexuality without any difficulty. But the present case emphatically contradicted it. The girl seemed to be defending herself against love for a man by directly transforming the lover into a persecutor: there was no sign of the influence of a woman, no trace of a struggle against a homosexual attachment.

In these circumstances the simplest thing would have been to abandon [266]
the theory that the delusion of persecution invariably depends on homosexuality, and at the same time to abandon everything that followed from that theory. Either the theory must be given up or else, in view of this departure from our expectations, we must side with the lawyer and assume that this was no paranoic combination but an actual experience which had been correctly interpreted. But I saw another way out, by which a final verdict could for the moment be postponed. I recollected how often wrong views have been taken about people who are ill psychically, simply because the physician has not studied them thoroughly

1 [See Part III of Freud's Schreber analysis (1911*c*), *RSE*, **12**.]

enough and has thus not learnt enough about them. I therefore said that I could not form an immediate opinion, and asked the patient to call on me a second time, when she could relate her story again at greater length and add any subsidiary details that might have been omitted. Thanks to the lawyer's influence I secured this promise from the reluctant patient; and he helped me in another way by saying that at our second meeting his presence would be unnecessary.

The story told me by the patient on this second occasion did not conflict with the previous one, but the additional details she supplied resolved all doubts and difficulties. To begin with, she had visited the young man in his rooms not once but twice. It was on the second occasion that she had been disturbed by the suspicious noise: in her original story she had suppressed, or omitted to mention, the first visit because it had no longer seemed of importance to her. Nothing noteworthy had happened during this first visit, but something did happen on the day after it. Her department in the business was under the direction of an elderly lady whom she described as follows: 'She has white hair like my mother.' This elderly superior had a great liking for her and treated her with affection, though sometimes she teased her; the girl regarded herself as her particular favourite. On the day after her first visit to the young man's rooms he appeared in the office to discuss some business matter with this elderly lady. While they were talking in low voices the patient suddenly felt convinced that he was telling her about their adventure of the previous day – indeed, that the two of them had for some time been having a love affair, which she had hitherto overlooked. The white-haired motherly old lady now knew everything, and her speech and conduct in the course
[267] of the day confirmed the patient's suspicion. At the first opportunity she took her lover to task about his betrayal. He naturally protested vigorously against what he called a senseless accusation. For the time being, in fact, he succeeded in freeing her from her delusion, and she regained enough confidence to repeat her visit to his rooms a short time – I believe it was a few weeks – afterwards. The rest we know already from her first narrative.

In the first place, this new information removes any doubts as to the pathological nature of her suspicion. It is easy to see that the white-haired elderly superior was a substitute for her mother, that in spite of his youth her lover had been put in the place of her father, and that it was the strength of her mother complex which had driven the patient to suspect a love relationship between these ill-matched partners, however unlikely such a relation might be. Moreover, this disposes of the

apparent contradiction to the expectation, based on psychoanalytic theory, that the development of a delusion of persecution will turn out to be determined by an over-powerful homosexual attachment. The *original* persecutor – the agency whose influence the patient wishes to escape – is here again not a man but a woman. The superior knew about the girl's love affairs, disapproved of them, and showed her disapproval by mysterious hints. The patient's attachment to her own sex [*Geschlecht*]^{T} opposed her attempts to adopt a person of the other sex as a love object. Her love for her mother had become the spokesman of all those tendencies which, playing the part of a 'conscience', seek to arrest a girl's first step along the new road to normal sexual satisfaction [*Sexualbefriedigung*] – in many respects a dangerous one; and indeed it succeeded in disturbing her relation with men.

When a mother hinders or arrests a daughter's sexual activity, she is fulfilling a normal function whose lines are laid down by events in childhood, which has powerful, unconscious motives [*Motivierung*]^{T}, *Motiv* and has received the sanction of society. It is the daughter's business to emancipate herself from this influence and to decide for herself on broad and rational grounds what her share of enjoyment or denial [*Versagung*]^{T} of sexual pleasure shall be. If in the attempt to emancipate herself she falls victim to a neurosis it implies the presence of a mother complex which is as a rule over-powerful, and is certainly unmastered. The conflict between this complex and the new direction taken by the libido is dealt with in the form of one neurosis or another, according to [268] the subject's disposition. The manifestation of the neurotic reaction will always be determined, however, not by her present-day relation to her actual mother but by her infantile relations to her earliest image of her mother.

We know that our patient had been fatherless for many years: we may also assume that she would not have kept away from men up to the age of thirty if she had not been supported by a powerful emotional attachment to her mother. This support became a heavy yoke when her libido began to turn to a man in response to his insistent wooing. She tried to free herself, to throw off her homosexual attachment; and her disposition, which need not be discussed here, enabled this to occur in the form of a paranoic delusion. The mother thus became the hostile and malevolent watcher and persecutor. As such she could have been overcome, had it not been that the mother complex retained power enough to carry out its purpose of keeping the patient at a distance from men. Thus, at the end of the first phase of the conflict the patient had become estranged

from her mother without having definitely gone over to the man. Indeed, both of them were plotting against her. Then the man's vigorous efforts succeeded in drawing her decisively to him. She conquered her mother's opposition in her mind and was willing to grant her lover a second meeting. In the later developments the mother did not reappear, but we may safely insist that in this [first] phase the lover had not become the persecutor directly but via the mother and by virtue of his relationship to the mother, who had played the leading part in the first delusion.

One would think that the resistance was now definitely overcome, that the girl who until now had been bound to her mother had succeeded in coming to love a man. But after the second visit a new delusion appeared, which, by making ingenious use of some accidental circumstances, destroyed this love and thus successfully carried through the purpose of the mother complex. It still seems strange that a woman should protect herself against loving a man by means of a paranoic delusion; but before examining this state of things more closely, let us glance at the accidental circumstances that formed the basis of this second delusion, the one aimed exclusively against the man.

[269] Lying partly undressed on the sofa beside her lover, she heard a noise like a click or knock[1] or beat. She did not know its cause, but she arrived at an interpretation [*deutet*] of it after meeting two men on the staircase, one of whom was carrying something that looked like a covered box. She became convinced that someone acting on instructions from her lover had watched and photographed her during their intimate tête-à-tête. I do not for a moment imagine, of course, that if the unlucky noise had not occurred the delusion would not have been formed; on the contrary, something inevitable is to be seen behind this accidental circumstance, something which was bound to assert itself compulsively in the patient, just as when she supposed that there was a liaison between her lover and the elderly superior, her mother substitute. Among the store of unconscious phantasies [*Phantasien*][T] of all neurotics, and probably of all human beings, there is one which is seldom absent and which can be disclosed by analysis: this is the phantasy of watching sexual intercourse between the parents. I call such phantasies – of the observation of sexual intercourse between the parents, of seduction, of castration, and others – 'primal phantasies'; and I shall discuss in detail elsewhere their origin and their relation to individual experience.[2] The

1 [These two words were overlooked in the *SE* translation.]

2 [The subject of 'primal phantasies' is discussed at length in Lecture XXIII of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 325 ff., and in his case history of the 'Wolf Man' (1918*b*), ibid., **17**, 52–4 and 87.]

accidental noise was thus merely playing the part of a provoking factor which activated the typical phantasy of overhearing which is a component of the parental complex. Indeed, it is doubtful whether we can rightly call the noise 'accidental'. As Otto Rank has remarked to me, such noises are on the contrary an indispensable part of the phantasy of listening, and they reproduce either the sounds which betray parental intercourse or those by which the listening child fears to betray itself. But now we know at once where we stand. The patient's lover was still her father, but she herself had taken her mother's place. The part of the listener had then to be allotted to a third person. We can see by what means the girl had freed herself from her homosexual dependence on her mother. It was by means of a small piece of regression: instead of choosing her mother as a love object, she identified herself with her – she herself *became* her mother. The possibility of this regression points to the narcissistic origin of her homosexual object choice and thus to the paranoic disposition in her.[1] One might sketch a train of thought which [270] would bring about the same result as this identification: 'If my mother does it, I may do it too; I've just as good a right as she has.'

One can go a step further in disproving the accidental nature of the noise. We do not, however, ask our readers to follow us, since the absence of any deeper analytic investigation makes it impossible in this case to go beyond a certain degree of probability. The patient mentioned in her first interview with me that she had immediately demanded an explanation of the noise, and had been told that it was probably the ticking of the small clock on the writing desk. I venture, however, to explain what she told me as a mistaken memory. It seems to me much more likely that at first she did not react to the noise at all, and that it became significant only after she met the two men on the staircase. Her lover, who had probably not even heard the noise, may have tried, perhaps on some later occasion when she assailed him with her suspicions, to account for it in this way: 'I don't know what noise you can have heard. Perhaps it was the small clock; it sometimes ticks like that.' This deferred use [*Nachträglichkeit*][T] of impressions and this displacement of recollections often occur precisely in paranoia and are characteristic of it. But as I never met the man and could not continue the analysis of the woman, my hypothesis cannot be proved.

I might go still further in the analysis of this ostensibly real 'accident'. I do not believe that the clock ever ticked or that there was any noise to be heard at all. The woman's situation justified a sensation of a knock or

1 [Cf. the similar regression from object love to identification described in 'Mourning and Melancholia' (1916–17*g* [1915]), p. 223 f. above.]

beat [*Klopfen*] in her clitoris. And it was this that she subsequently [*nachträglich*] projected as a perception of an external object. Just the same sort of thing can occur in dreams. A hysterical woman patient of mine once related to me a short arousal dream to which she could bring no spontaneous associations [*Einfällen*][T]. She dreamt simply that someone knocked and then she awoke. Nobody had knocked at the door, but during the previous nights she had been awakened by distressing sensations of pollutions: she thus had a motive for awakening as soon as she felt the first sign of genital excitation. There had been a 'knock' in her clitoris.[1] In the case of our paranoic patient, I should substitute for the accidental noise a similar process of projection. I certainly cannot
[271] guarantee that in the course of our short acquaintance the patient, who was reluctantly yielding to compulsion, gave me a truthful account of all that had taken place during the two meetings of the lovers. But an isolated contraction of the clitoris would be in keeping with her statement that no contact of the genitals had taken place. In her subsequent rejection of the man, lack of satisfaction undoubtedly played a part as well as 'conscience'.

Let us consider again the outstanding fact that the patient protected herself against her love for a man by means of a paranoic delusion. The key to the understanding of this is to be found in the history of the development of the delusion. As we might have expected, the latter was at first aimed against the woman. But now, *on this paranoic basis, the advance from a female to a male object was accomplished*. Such an advance is unusual in paranoia; as a rule we find that the victim of persecution remains fixated to the same persons, and therefore to the same sex to which his love objects belonged before the paranoic transformation took place. But neurotic disorder does not preclude an advance of this kind, and our observation may be typical of many others. There are many similar processes occurring outside paranoia which have not yet been looked at from this point of view, among them some which are very familiar. For instance, the so-called neurasthenic's unconscious attachment to incestuous love objects prevents him from choosing a strange woman as his object and restricts his sexual activity to phantasy. But within the limits of phantasy he achieves the progress which is denied him, and he succeeds in replacing mother and sister with extraneous objects. Since the veto of the censorship does not come into action with these objects, he can become conscious in his phantasies of his choice of these substitute figures.

1 [Cf. a similar instance in Lecture XVII of Freud's *Introductory Lectures* (1916–17*a*), *RSE*, **16**, 235.]

These then are phenomena of an attempted advance from the new ground which has as a rule been regressively acquired; and we may set alongside them the efforts made in some neuroses to regain a position of the libido which was once held and subsequently lost. Indeed we can hardly draw any conceptual distinction between these two classes of phenomena. We are too apt to think that the conflict underlying a neurosis is brought to an end when the symptom has been formed. In reality the struggle can go on in many ways after this. Fresh drive components [*Triebanteile*][T] arise on both sides, and these prolong it. The symptom [272] *Trieb*
itself becomes an object of this struggle; certain trends anxious to preserve it conflict with others which strive to remove it and to re-establish the *status quo ante*. Methods are often sought of rendering the symptom nugatory by trying to regain along other lines of approach what has been lost and is now withheld by the symptom. These facts throw much light on a statement made by C. G. Jung to the effect that a peculiar 'psychical inertia', which opposes change and progress, is the fundamental precondition of neurosis. This inertia is indeed most peculiar; it is not a general one, but is highly specialized; it is not even all-powerful within its own field, but fights against tendencies towards progress and recovery which remain active even after the formation of neurotic symptoms. If we search for the starting point of this special inertia, we discover that it is the manifestation of very early linkages – linkages which it is hard to resolve – between drives and impressions and the objects involved in those impressions. These linkages have the effect of bringing the development of the drives concerned to a standstill. Or in other words, this specialized 'psychical inertia' is only a different term, though hardly a better one, for what in psychoanalysis we are accustomed to call a 'fixation'.[1]

1 [This tendency to fixation, or, as he called it elsewhere, 'adhesiveness of the libido', had been alluded to by Freud in the first edition of his *Three Essays* (1905*d*), *RSE*, **7**, 214–15. It was further discussed by him in his case history of the 'Wolf Man' (1918*b*), ibid., **17**, 103–4, and in Lecture XXII of his *Introductory Lectures* (1916–17*a*), ibid., **16**, 300, both of which works were more or less contemporary with the present paper. He returned to it much later, in Section VI of his 'Analysis Terminable and Interminable' (1937*c*), ibid., **23**, 218, where he himself made use of the term 'psychical inertia', and where he related the phenomenon to the 'resistance of the id' which is met with in psychoanalytic treatment, and which, in *Inhibitions, Symptoms and Anxiety* (1926*d*), Chapter XI, Section A (*a*); ibid., **20**, 141, he had attributed to the power of the compulsion to repeat. A last allusion to 'psychical inertia' occurs near the end of Chapter VI of his posthumously published *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, 164. The special case of 'inertia of the libido' is referred to in Chapter V of *Civilization and its Discontents* (1930*a*), ibid., **21**, 97. For a note on the translation of '*Fixierung* (fixation)', see ibid., **24**, 67.]

1985 *PFL*, **12**, 61–89. (Reprint of the *SE* version.)

The present translation is a revised and corrected reprint of the *SE* version.

These two essays were written round about February and March, 1915, some six months after the outbreak of the First World War, and express some of Freud's considered views on it. His more personal reactions can be found described in Chapter VII of Ernest Jones's second volume (1955). Towards the end of the same year, 1915, Freud wrote another essay on an analogous theme, 'On Transience', which can be found below (p. 307 ff.). Many years later he returned to the subject once more in his open letter to Einstein, *Why War?* (1933*b*), *RSE*, **22**. The second of the present two essays – on death – is, of course, to a great extent based on the same material as Section II of *Totem and Taboo* (1912–13*a*), ibid., **13**. This paper was first read by Freud at a meeting, on February 16, 1915, of the B'nai B'rith, the Jewish club in Vienna to which he belonged for a large part of his life. (Cf. 1926*j*.) The lecture version was published, under the title '*Wir und der Tod*' ('Death and Us'), a few weeks after delivery in the proceedings of the club (Freud, 1915*i*) and reprinted (with valuable editorial commentary) by Nitzschke (1991). Some of the more substantial variations between the

lecture and essay versions are identified in editorial footnotes in the present edition. For a complete comparative translation, see Solms (1993). For an analysis of the differences between the lecture version and a draft of the lecture, discovered by Ilse Grubrich-Simitis, see Grubrich-Simitis (1993, 174–6; trans., 132–4). An even earlier sketch of some of the theses in 'Death and Us' and 'Our Attitude towards Death' can be found in the Appendix below (p. 300 f.): Freud's letter to a Dutch acquaintance, Frederik van Eeden, dated December 28, 1914, which was published a short time before the present work.

THOUGHTS FOR THE TIMES ON WAR AND DEATH

I
THE DISILLUSIONMENT OF THE WAR

In the confusion of wartime in which we are caught up, relying as we must on one-sided information, standing too close to the great changes that have already taken place or are beginning to, and without a glimmering of the future that is being shaped, we ourselves are at a loss as to the significance of the impressions which press in upon us and as to the value of the judgements which we form. We cannot but feel that no event has ever destroyed so much that is precious in the common possessions of humanity, confused so many of the clearest intelligences, or so thoroughly debased what is highest. Science itself has lost its passionless impartiality; its deeply embittered servants seek for weapons from it with which to contribute towards the struggle with the enemy. Anthropologists feel driven to declare the enemy inferior and degenerate, psychiatrists issue a diagnosis of his disease of mind or spirit. Probably, however, our sense of these immediate evils is disproportionately strong, and we are not entitled to compare them with the evils of other times which we have not experienced. [275]

The individual who is not himself a combatant – and so a cog in the gigantic machine of war – feels bewildered in his orientation, and inhibited [*gehemmt*]^{T} in his powers and activities. I believe that he will welcome any indication, however slight, which will make it easier for him to find his bearings within himself at least. I propose to pick out two among the factors which are responsible for the mental [*seelische*]^{T} distress felt by non-combatants, against which it is such a heavy task to struggle, and to treat of them here: the disillusionment which this war has evoked, and the altered attitude towards death which this – like every other war – forces upon us. *Hemmung* *Seele*

When I speak of disillusionment, everyone will know at once what I mean. One need not be a sentimentalist; one may perceive the [276]

biological and psychological necessity for suffering in the economy of human life, and yet condemn war both in its means and ends and long for the cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as nations live under such widely differing conditions, so long as the value of individual life is so variously assessed among them, and so long as the animosities which divide them represent such powerful driving forces [*Triebkräfte*]^{T} in the mind. We were prepared to find that wars between the primitive and the civilized [*zivilisierten*]^{T} peoples, between the races who are divided by the colour of their skin – wars, even, against and among the nationalities of Europe whose civilization is little developed or has been lost – would occupy mankind for some time to come. But we permitted ourselves to have other hopes. We had expected the great world-dominating nations of white races upon whom the leadership of the human species has fallen, who were known to have world-wide interests as their concern, to whose creative powers were due not only our technical advances towards the control of nature but the artistic and scientific standards of civilization [*Kulturwerte*] – we had expected these peoples to succeed in discovering another way of settling misunderstandings and conflicts of interest. Within each of these nations high norms of moral conduct were laid down for the individual, to which his manner of life was bound to conform if he desired to take part in a civilized community [*Kulturgemeinschaft*]. These ordinances, often too stringent, demanded a great deal of him – much self-restraint, much renunciation of drive satisfaction. He was above all forbidden to make use of the immense advantages to be gained by the practice of lying and deception in the competition with his fellow men. The civilized states regarded these moral standards as the basis of their existence. They took serious steps if anyone ventured to tamper with them, and often declared it improper even to subject them to examination by a critical intelligence. It was to be assumed, therefore, that the state itself would respect them, and would not think of undertaking anything against them which would contradict the basis of its own existence. Observation showed, to be sure, that embedded in these civilized states there were remnants of certain other peoples, which were universally unpopular and had therefore been only reluctantly, and even so not fully, admitted to participation in the common work of civilization, for which they had shown themselves suitable enough. But the great nations themselves, it might have been supposed, would have acquired so much comprehension of what they had in common, and so much tolerance for their

Zivilisation

[277]

differences, that 'foreigner' and 'enemy' could no longer be merged, as they still were in classical antiquity, into a single concept.

Relying on this unity among the civilized peoples, countless men and women have exchanged their native home for a foreign one, and made their existence dependent on the intercommunications between friendly nations. Moreover, anyone who was not by stress of circumstance confined to one spot could create for himself out of all the advantages and attractions of these civilized countries a new and wider fatherland, in which he could move about without hindrance or suspicion. In this way he enjoyed the blue sea and the grey; the beauty of snow-covered mountains and of green meadow lands; the magic of northern forests and the splendour of southern vegetation; the mood evoked by landscapes that recall great historical events, and the silence of untouched nature. This new fatherland was a museum for him, too, filled with all the treasures which the artists of civilized humanity had in the successive centuries created and left behind. As he wandered from one gallery to another in this museum, he could recognize with impartial appreciation what varied types of perfection a mixture of blood, the course of history, and the special quality of their mother-earth had produced among his compatriots in this wider sense. Here he would find cool, inflexible energy developed to the highest point; there, the graceful art of beautifying existence; elsewhere, the feeling for orderliness and law, or others among the qualities which have made mankind the lords of the earth.

Nor must we forget that each of these citizens of the civilized world had created for himself a 'Parnassus' and a 'School of Athens' of his own.[1] From among the great thinkers, writers and artists of all nations he had chosen those to whom he considered he owed the best of what he had been able to achieve in enjoyment and understanding of life, and he had venerated them along with the immortal ancients as well as with the familiar masters of his own tongue. None of these great men had [278] seemed to him foreign because they spoke another language – neither the incomparable explorer of human passions, nor the intoxicated worshipper of beauty, nor the powerful and menacing prophet, nor the subtle satirist; and he never reproached himself on that account for being a renegade towards his own nation and his beloved mother tongue.

The enjoyment of this common civilization was disturbed from time to time by warning voices, which declared that old traditional differences

1 [Two of the famous frescoes by Raphael in the papal apartments of the Vatican. One of them represents a group of the world's great poets and the other a similar group of scholars. In *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 279 f., Freud uses the same two paintings as a parallel to one of the techniques employed by the dream-work.]

made wars inevitable, even among the members of a community such as this. We refused to believe it; but if such a war were to happen, how did we picture it? We saw it as an opportunity for demonstrating the progress of comity among men since the era when the Greek Amphictyonic Council proclaimed that no city of the league might be destroyed, nor its olive-groves cut down, nor its water supply stopped; we pictured it as a chivalrous passage of arms, which would limit itself to establishing the superiority of one side in the struggle, while as far as possible avoiding acute suffering that could contribute nothing to the decision, and granting complete immunity for the wounded who had to withdraw from the contest, as well as for the doctors and nurses who devoted themselves to their recovery. There would, of course, be the utmost consideration for the non-combatant classes of the population – for women who take no part in war-work, and for the children who, when they are grown up, should become on both sides one another's friends and helpers. And again, all the international undertakings and institutions in which the common civilization of peacetime had been embodied would be maintained.

Even a war like this would have produced enough horror and suffering; but it would not have interrupted the development of ethical relations between the collective individuals of mankind – the peoples and states.

Then the war in which we had refused to believe broke out, and it brought – disillusionment. Not only is it more bloody and more destructive than any war of other days, because of the enormously increased perfection of weapons of attack and defence; it is at least as cruel, as embittered, as implacable as any that has preceded it. It disregards all the restrictions known as international law, which in peacetime the states
[279] had bound themselves to observe; it ignores the prerogatives of the wounded and the medical service, the distinction between civil and military sections of the population, the claims of private property. It tramples in blind fury on all that comes in its way, as though there were to be no future and no peace among men after it is over. It cuts all the common bonds between the contending peoples, and threatens to leave a legacy of embitterment that will make any renewal of those bonds impossible for a long time to come.

Moreover, it has brought to light an almost incredible phenomenon: the civilized nations know and understand one another so little that one can turn against the other with hate and loathing. Indeed, one of the great civilized nations is so universally unpopular that the attempt can actually be made to exclude it from the civilized community as 'barbaric', although it has long proved its fitness by the magnificent contributions to

that community which it has made.[1] We live in hopes that the pages of an impartial history will prove that that nation, in whose language we write and for whose victory our dear ones are fighting, has been precisely the one which has least transgressed the laws of civilization. But at such a time who dares to set himself up as judge in his own cause?

Peoples are more or less represented by the states which they form, and these states by the governments which rule them. The individual citizen can with horror convince himself in this war of what would occasionally cross his mind in peacetime – that the state has forbidden to the individual the practice of wrongdoing, not because it desires to abolish it, but because it desires to monopolize it, like salt and tobacco. A belligerent state permits itself every such misdeed, every such act of violence, as would disgrace the individual. It makes use against the enemy not only of the accepted *ruses de guerre*, but of deliberate lying and deception as well – and to a degree which seems to exceed the usage of former wars. The state exacts the utmost degree of obedience and sacrifice from its citizens, but at the same time it treats them like children by an excess of secrecy and a censorship upon news and expressions of opinion which leaves the spirits of those whose intellects it thus suppresses defenceless against every unfavourable turn of events and every sinister rumour. It absolves itself of the guarantees and treaties by which it was bound to [280] other states, and confesses shamelessly to its own rapacity and lust for power, which the private individual has then to sanction in the name of patriotism.

It should not be objected that the state cannot refrain from wrongdoing, since that would place it at a disadvantage. It is no less disadvantageous, as a general rule, for the individual man to conform to the standards of morality and refrain from brutal and arbitrary conduct; and the state seldom proves able to indemnify him for the sacrifices it exacts. Nor should it be a matter for surprise that this relaxation of all the moral ties between the collective individuals of mankind should have had repercussions on the morality of individuals; for our conscience is not the inflexible judge that ethical teachers declare it, but in its origin is 'social anxiety' ['*soziale Angst*'][T] and nothing else.[2] When the community no longer raises objections, there is an end, too, to the suppression of evil passions, and men perpetrate deeds of cruelty, fraud, treachery

Angst

1 [Cf. a reference back to this in Chapter V of Freud's *Autobiographical Study* (1925*d*), *RSE*, **20**, 43 *n.* 1.]

2 [Freud had already given a less simplified view of the nature of conscience in his paper on narcissism (1914*c*). See above, p. 83.]

and barbarity so incompatible with their level of civilization that one would have thought them impossible.

Well may the citizen of the civilized world of whom I have spoken stand helpless in a world that has grown strange to him – his great fatherland disintegrated, its common estates laid waste, his fellow citizens divided and debased!

There is something to be said, however, in criticism of his disappointment. Strictly speaking it is not justified, for it consists in the destruction of an illusion. We welcome illusions because they spare us unpleasurable
Unlust feelings [*Unlustgefühle*][T], and enable us to enjoy satisfactions instead. We must not complain, then, if now and again they come into collision with some portion of reality, and are shattered against it.

Two things in this war have aroused our sense of disillusionment: the low morality shown externally by states which in their internal relations pose as the guardians of moral standards, and the brutality shown by individuals whom, as participants in the highest human civilization, one would not have thought capable of such behaviour.

Let us begin with the second point and try to formulate, in a few brief
[281] words, the point of view that we wish to criticize. How, in point of fact, do we imagine the process by which an individual rises to a comparatively high plane of morality? The first answer will no doubt simply be that he is virtuous and noble from birth – from the very start. We shall not consider this view any further here. A second answer will suggest that we are concerned with a developmental process, and will probably assume that the development consists in eradicating his evil human tendencies and, under the influence of education and a civilized environment, replacing them with good ones. If so, it is nevertheless surprising that evil should re-emerge with such force in anyone who has been brought up in this way.

But this answer also contains the thesis which we propose to contradict. In reality, there is no such thing as 'eradicating' evil. Psychological – or, more strictly speaking, psychoanalytic – investigation shows instead that the deepest essence of human nature consists of drive impulses
Trieb, Regung [*Triebregungen*][T] which are of an elementary nature, which are similar in all men and which aim at the satisfaction of certain primal needs. These impulses in themselves are neither good nor bad. We classify them and their expressions in that way, according to their relation to the needs and demands of the human community. It must be granted that all the impulses which society condemns as evil – let us take as representative the selfish and the cruel ones – are of this primitive kind.

These primitive impulses undergo a lengthy process of development before they are allowed to become active in the adult. They are inhibited, directed towards other aims and fields, become commingled, alter their objects, and are to some extent turned back upon their possessor. Reaction-formations [*Reaktionsbildungen*]^{T} against certain drives take the deceptive form of a change in their content, as though egoism [*Egoismus*] had changed into altruism, or cruelty into pity.[1] These reaction-formations are facilitated by the circumstance that some drive impulses make their appearance almost from the first in pairs of opposites – a very remarkable phenomenon, and one strange to the lay public, which is termed 'ambivalence of feeling'. The most easily observed and comprehensible instance of this is the fact that intense love and intense hatred are so often to be found together in the same person. Psychoanalysis adds that the two opposed feelings not infrequently have the same person for their object. *Bildung*

It is not until all these 'drive vicissitudes' ['*Triebschicksale*']^{T} have been surmounted that what we call a person's character is formed, and this, as we know, can only very inadequately be classified as 'good' or 'bad'. A human being is seldom altogether good or bad; he is usually 'good' in one relation and 'bad' in another, or 'good' in certain external circumstances and in others decidedly 'bad'. It is interesting to find that the pre-existence of strong 'bad' impulses in infancy is often the actual condition for an unmistakable inclination towards 'good' in the adult. Those who as children have been the most pronounced egoists may well become the most helpful and self-sacrificing members of the community; most of our sentimentalists, friends of humanity and protectors of animals have been evolved from little sadists and animal-tormentors. [282] *Schicksal*

The transformation of 'bad' drives is brought about by two factors working in the same direction, an internal and an external one. The internal factor consists in the influence exercised on the bad (let us say, the egoistic) drives by erotism – that is, by the human need for love, taken in its widest sense. By the admixture of *erotic* components the egoistic drives are transformed into *social* ones. We learn to value being loved as an advantage for which we are willing to sacrifice other advantages. The external factor is the force [*Zwang*]^{T} exercised by upbringing, which represents the claims of our cultural environment, and this is continued later by the direct pressure of that environment. Civilization has been attained through the renunciation of drive satisfaction, and it demands the same renunciation from each newcomer in turn. Throughout an

1 [Cf. 'Drives and their Vicissitudes' (1915*c*), p. 113 above.]

individual's life there is a constant replacement of external with internal compulsion. The influences of civilization cause an ever-increasing transformation of egoistic trends into altruistic and social ones by an admixture of erotic elements. In the last resort it may be assumed that every internal compulsion which makes itself felt in the development of human beings was originally – that is, in the *history of mankind* – only an external one. Those who are born today bring with them as an inherited organization some degree of tendency (disposition) towards the transformation of egoistic into social drives, and this disposition is easily stimulated into bringing about that result. A further portion of this drive transformation has to be accomplished during the life of the individual
[283] himself. So the human being is subject not only to the pressure of his immediate cultural environment, but also to the influence of the cultural history of his ancestors.

If we give the name of 'susceptibility to culture' to a man's personal capacity for the transformation of the egoistic impulses under the influence of erotism, we may further affirm that this susceptibility is made up of two parts, one innate and the other acquired in the course of life, and that the relation of the two to each other and to that portion of the life of the drives which remains untransformed is a very variable one.

Generally speaking, we are apt to attach too much importance to the innate part, and in addition to this we run the risk of overestimating the total susceptibility to culture in comparison with the portion of the drives which has remained primitive – that is, we are misled into regarding men as 'better' than they actually are. For there is yet another element which obscures our judgement and falsifies the issue in a favourable sense.

The drive impulses of other people are, of course, hidden from our observation. We infer them from their actions and behaviour, which we trace back to *motives* [*Motive*][T] arising from their drive activity. Such an inference is bound to be erroneous in many cases. This or that action which is 'good' from the cultural point of view may in one instance originate from a 'noble' motive, in another not. Ethical theorists class as 'good' actions only those which are the outcome of good impulses; to the others they refuse recognition. But society, which is practical in its aims, is not on the whole troubled by this distinction; it is content if a man regulates his behaviour and actions by the precepts of civilization, and is little concerned with his motives.

We have learnt that the *external compulsion* [*Zwang*] exercised on a human being by his upbringing and environment produces a further

transformation towards good in his drive activity – a further turning from egoism towards altruism. But this is not the regular or necessary effect of the external compulsion. Upbringing and environment not only offer benefits in the way of love, but also employ other kinds of incentive, namely, rewards and punishments. In this way their effect may turn out to be that a person who is subjected to their influence will choose to behave well in the cultural sense of the phrase, although no ennoblement of drive, no transformation of egoistic into altruistic inclinations, has [284] taken place in him. The result will, roughly speaking, be the same; only a particular concatenation of circumstances will reveal that one man always acts in a good way because his drive inclinations compel him to, and the other is good only insofar and for so long as such cultural behaviour is advantageous for his own selfish purposes. But superficial acquaintance with an individual will not enable us to distinguish between the two cases, and we are certainly misled by our optimism into grossly exaggerating the number of human beings who have been transformed in a cultural sense.

Civilized society, which demands good conduct and does not trouble itself about the drive basis of this conduct, has thus won over to obedience a great many people who are not in this following their own natures. Encouraged by this success, society has allowed itself to be misled into tightening the moral standard to the greatest possible degree, and it has thus forced its members into a yet greater estrangement from their drive disposition. They are consequently subject to an unceasing suppression of drive, and the resulting tension betrays itself in the most remarkable phenomena of reaction and compensation. In the domain of sexuality, where such suppression is most difficult to carry out, the result is seen in the reactive phenomena of neurotic disorders. Elsewhere the pressure of civilization brings in its train no pathological results, it is true, but is shown in malformations of character, and in the perpetual readiness of the inhibited drives to break through to satisfaction at any suitable opportunity. Anyone thus compelled to act continually in accordance with precepts which are not the expression of his drive inclinations is living, psychologically speaking, beyond his means, and may objectively be described as a hypocrite, whether he is clearly aware of the incongruity or not. It is undeniable that our contemporary civilization favours the production of this form of hypocrisy to an extraordinary extent. One might venture to say that it is built up on such hypocrisy, and that it would have to submit to far-reaching modifications if people were to undertake to live in accordance with psychological truth. Thus there are

very many more cultural hypocrites than truly civilized men – indeed, it is a debatable point whether a certain degree of cultural hypocrisy is not indispensable for the maintenance of civilization, because the
[285] susceptibility to culture which has hitherto been organized in the minds of present-day men would perhaps not prove sufficient for the task. On the other hand, the maintenance of civilization even on so dubious a basis offers the prospect of paving the way in each new generation for a more far-reaching transformation of drive which shall be the vehicle of a better civilization.

We may already derive one consolation from this discussion: our mortification and our painful disillusionment on account of the uncivilized behaviour of our fellow citizens of the world during this war were unjustified. They were based on an illusion to which we had given way. In reality our fellow citizens have not sunk so low as we feared, because they had never risen so high as we believed. The fact that the collective individuals of mankind, the peoples and states, mutually abrogated their moral restraints naturally prompted these individual citizens to withdraw for a while from the constant pressure of civilization and to grant a temporary satisfaction to the drives which they had been holding in check. This probably involved no breach in their relative morality within their own nations.

We may, however, obtain a deeper insight than this into the change brought about by the war in our former compatriots, and at the same time receive a warning against doing them an injustice. For the development of the mind shows a peculiarity which is present in no other developmental process. When a village grows into a town or a child into a man, the village and the child become lost in the town and the man. Memory alone can trace the old features in the new picture; and, in fact, the old materials or forms have been got rid of and replaced with new ones. It is otherwise with the development of the mind. Here one can describe the state of affairs, which has nothing to compare with it, only by saying that in this case every earlier stage of development persists alongside the later stage which has arisen from it; here succession also involves coexistence, although it is to the same materials that the whole series of transformations has applied. The earlier mental state may not have manifested itself for years, but nonetheless it is so far present that it may at any time again become the mode of expression of the forces in the mind, and indeed the only one, as though all later developments had been annulled or undone. This extraordinary plasticity of mental developments is not unrestricted as regards direction; it may be

described as a special capacity for involution [*Rückbildung*] – for regression [*Regression*] – since it may well happen that a later and higher stage of development, once abandoned, cannot be reached again. But the primitive stages can always be re-established; the primitive mind is, in the fullest meaning of the word, imperishable. [286]

What are called mental diseases [*Geisteskrankheiten*] inevitably produce an impression in the layman that intellectual and mental life [*Geistes- und Seelenleben*] have been destroyed. In reality, the destruction applies only to later acquisitions and developments. The essence of mental disease lies in a return to earlier states of affective life and of functioning. An excellent example of the plasticity of mental life is afforded by the state of sleep, which is our goal every night. Since we have learnt to interpret [*übersetzen*][T] even absurd and confused dreams, we know that whenever we go to sleep we throw off our hard-won morality like a garment, and put it on again next morning. This stripping of ourselves is not, of course, dangerous, because we are paralysed, condemned to inactivity, by the state of sleep. It is only dreams that can tell us about the regression of our emotional life to one of the earliest stages of development. For instance, it is noteworthy that all our dreams are governed by purely egoistic motives.[1] One of my English friends put forward this thesis at a scientific meeting in America, whereupon a lady who was present remarked that that might be the case in Austria, but she could assert as regards herself and her friends that *they* were altruistic even in their dreams. My friend, although himself of English race, was obliged to contradict the lady emphatically on the ground of his personal experience in dream analysis, and to declare that in their dreams high-minded American ladies were quite as egoistic as the Austrians. *Übersetzung*

Thus the transformation of drive, on which our susceptibility to culture is based, may also be permanently or temporarily undone by the impacts of life. The influences of war are undoubtedly among the forces that can bring about such involution; so we need not deny susceptibility to culture to all who are at the present time behaving in an uncivilized way, and we may anticipate that the ennoblement of their drives will be restored in more peaceful times.

There is, however, another symptom in our fellow citizens of the world which has perhaps astonished and shocked us no less than the descent from their ethical heights which has given us so much pain. What I [287]

1 [Freud later qualified this view in an addition made in 1925 to a footnote to *The Interpretation of Dreams* (*RSE*, **4**, 240 *n.* 2) where he also tells the anecdote which follows. The 'English friend', as is there made plain, was Ernest Jones.]

have in mind is the want of insight shown by the best intellects [*Köpfen*], their obduracy, their inaccessibility to the most forcible arguments and their uncritical credulity towards the most disputable assertions. This indeed presents a lamentable picture, and I wish to say emphatically that in this I am by no means a blind partisan who finds all the intellectual [*intellektuellen*] shortcomings on one side. But this phenomenon is much easier to account for and much less disquieting than the one we have just considered. Students of human nature and philosophers have long taught us that we are mistaken in regarding our intelligence [*Intelligenz*] as an independent force [*Macht*] and in overlooking its dependence on emotional life. Our intellect, they teach us, can function reliably only when it is removed from the influences of strong emotional impulses; otherwise it behaves merely as an instrument of the will and delivers the inference which the will requires. Thus, in their view, logical arguments are impotent against affective interests, and that is why disputes backed by reasons, which in Falstaff's phrase are 'as plenty as blackberries',[1] are so unfruitful in the world of interests. Psychoanalytic experience has, if possible, further confirmed this statement. It can show every day that the shrewdest people will all of a sudden behave without insight, like imbeciles, as soon as the necessary insight is confronted by an emotional resistance, but that they will completely regain their understanding once that resistance has been overcome. The logical bedazzlement which this war has conjured up in our fellow citizens, many of them the best of their kind, is therefore a secondary phenomenon, a consequence of emotional excitement, and is bound, we may hope, to disappear with it.

Having in this way once more come to understand our fellow citizens who are now alienated from us, we shall much more easily endure the disappointment which the nations, the collective individuals of mankind, have caused us, for the demands we make upon these should be far more modest. Perhaps they are recapitulating the course of individual development, and today still represent very primitive phases in organization and in the formation of higher unities. It is in agreement with this
[288] that the educative factor of an external compulsion towards morality, which we found was so effective in individuals, is as yet barely discernible in them. We had hoped, certainly, that the extensive community of interests established by commerce and production would constitute the germ of such a compulsion, but it would seem that nations still obey their passions far more readily than their interests. Their interests serve them, at

1 [See p. 20 *n*. above.]

most, as *rationalizations* for their passions; they put forward their interests in order to be able to give reasons for satisfying their passions. It is, to be sure, a mystery why the collective individuals should in fact despise, hate and detest one another – every nation against every other – and even in times of peace. I cannot tell why that is so. It is just as though when it becomes a question of a number of people, not to say millions, all individual moral acquisitions are obliterated, and only the most primitive, the oldest, the crudest mental attitudes are left. It may be that only later stages in development will be able to make some change in this regrettable state of affairs. But a little more truthfulness and honesty on all sides – in the relations of men to one another and between them and their rulers – should also smooth the way for this transformation.[1]

1 [The effects of the conflict between civilization and the drives (pp. 281–5 above) is a question which Freud discussed many times – from his early '"Civilized" Sexual Morality and Modern Nervous Illness' (1908*d*), *RSE*, **9**, to his late *Civilization and its Discontents* (1930*a*), ibid., **21**.]

II
OUR ATTITUDE TOWARDS DEATH

[289] The second factor to which I attribute our present sense of estrangement in this once lovely and congenial world is the disturbance that has taken place in the attitude which we have hitherto adopted towards death.[1]

That attitude was far from straightforward. To anyone who listened to us we were of course prepared to maintain that death was the necessary outcome of life, that everyone owes nature a death[2] and must expect to pay the debt – in short, that death was natural, undeniable and unavoidable. In reality, however, we were accustomed to behave as if it were otherwise.[3] We showed an unmistakable tendency to put death on one side, to eliminate it from life. We tried to hush it up; indeed we even have a saying [in German]: 'to think of something as though it were death'.[4] That is, as though it were our own death, of course. It is indeed impossible to imagine our own death; and whenever we attempt to do so we can perceive that we are in fact still present as spectators. Hence the psychoanalytic school could venture on the assertion that at bottom no-one believes in his own death, or, to put the same thing in another way, that in the unconscious every one of us is convinced of his own immortality.

1 [See Editors' Note, p. 273 f. above. The B'nai B'rith lecture version of this essay (entitled 'Death and Us') begins differently:

'Honourable Presidents and dear Brethren. – Please do not suppose that I gave my lecture such an eerie title in order to upset you. I know there are many people who wish to have nothing to do with death – perhaps, therefore, amongst yourselves too – and I wanted to avoid luring these Brethren into a lecture that would distress them. I could also have amended the other part of my title. Instead of "Death and *Us*", it could have read: "Death and *Us Jews*", for it is precisely we Jews who reveal most frequently and in the most extreme ways the attitude towards death that I wish to deal with before you today.

'However, you can easily imagine what led me to choose precisely this theme. It is a result of the terrible war that is raging at the moment, depriving us all of our bearings in life. I have observed, I believe, that foremost amongst the factors that are effecting this confusion is the change that has taken place in our attitude towards death.']

2 [A reminiscence of Prince Hal's remark to Falstaff in *Henry IV*, *Part I*, Act V, Scene 1: 'Thou owest God a death.' This was a favourite misquotation of Freud's. See, for instance, *The Interpretation of Dreams*, *RSE*, **4**, 182, and a letter to Fliess of February 6, 1899 (Freud, 1950*a*, Letter 104), in which he explicitly attributes it to Shakespeare.]

3 [In the B'nai B'rith version, where this paragraph is considerably expanded, Freud adds: 'Indeed, when one of us – a Jew – dies, then we would have to conclude that a Jew never dies of natural causes at all. At the very least a doctor must have done him damage, otherwise he would still be alive today. Although it is conceded that one must eventually die, we tend to shift this "eventually" into the unforeseeable future. When one asks a Jew how old he is, he likes to answer: sixty (or thereabouts) to one-hundred-and-twenty!']

4 [I.e. to think something unlikely or incredible.]

When it comes to someone else's death, the civilized man will carefully avoid speaking of such a possibility in the hearing of the person under sentence. Children alone disregard this restriction; they unashamedly threaten one another with the possibility of dying, and even go so far as to do the same thing to someone whom they love, as, for instance: 'Dear Mummy, when you're dead I'll do this or that.' The civilized adult can hardly even entertain the thought of another person's death without [290] seeming to himself hard-hearted or wicked; unless, of course, as a doctor or lawyer or something of the kind, he has to deal with death professionally. Least of all will he allow himself to think of the other person's death if some gain to himself in freedom, property or position is bound up with it. This sensitiveness of ours does not, of course, prevent the occurrence of deaths; when one does happen, we are always deeply affected, and it is as though we were badly shaken in our expectations. Our habit is to lay stress on the fortuitous causation of the death – accident, disease, infection, advanced age; in this way we betray an effort to reduce death from a necessity to a chance event. A number of simultaneous deaths strikes us as something extremely terrible. Towards the actual person who has died we adopt a special attitude – something almost like admiration for someone who has accomplished a very difficult task. We suspend criticism of him, overlook his possible misdeeds, declare that '*de mortuis nil nisi bonum*',[1] and think it justifiable to set out all that is most favourable to his memory in the funeral oration and upon the tombstone. Consideration for the dead, who, after all, no longer need it, is more important to us than the truth, and certainly, for most of us, than consideration for the living.

The complement to this cultural and conventional attitude towards death is provided by our complete collapse when death has struck down someone who is close to us – a parent or a partner in marriage, a brother or sister, a child or a dear friend. Our hopes, our desires and our pleasures lie in the grave with him, we will not be consoled, we will not fill the lost one's place. We behave as if we were a kind of Asra, who die when those they love die.[2]

But this attitude of ours towards death has a powerful effect on our lives. Life is impoverished, it loses in interest, when the highest stake in the game of living, life itself, may not be risked. It becomes as shallow and empty as, let us say, an American flirtation, in which it is understood from the first that nothing is to happen, as contrasted with a Continental

1 ['Speak nothing but good of the dead.']

2 [The Asra in Heine's poem ('Der Asra', in *Romanzero*, based on a passage in Stendhal's *De l'amour*) were a tribe of Arabs who 'die when they love'.]

love affair in which both partners must constantly bear its serious conse-
[291] quences in mind. Our emotional ties, the unbearable intensity of our grief, make us disinclined to court danger for ourselves and for those who belong to us. We dare not contemplate a great many undertakings which are dangerous but in fact indispensable, such as attempts at artificial flight, expeditions to distant countries or experiments with explosive substances. We are paralysed by the thought of who is to take the son's place with his mother, the husband's with his wife, the father's with his children, if a disaster should occur. Thus the tendency to exclude death from our calculations in life brings in its train many other renunciations and exclusions. Yet the motto of the Hanseatic League ran: '*Navigare necesse est, vivere non necesse*.' ('It is necessary to sail the seas, it is not necessary to live.')[1]

It is an inevitable result of all this that we should seek in the world of fiction, in literature and in the theatre compensation for what has been lost in life. There we still find people who know how to die – who, indeed, even manage to kill someone else. There alone too the condition can be fulfilled which makes it possible for us to reconcile ourselves with death: namely, that behind all the vicissitudes of life we should still be able to preserve a life intact. For it is really too sad that in life it should be as it is in chess, where one false move may force us to resign the game, but with the difference that we can start no second game, no return match. In the realm of fiction we find the plurality of lives which we need. We die with the hero with whom we have identified ourselves; yet we survive him, and are ready to die again just as safely with another hero.

It is evident that war is bound to sweep away this conventional treatment of death. Death will no longer be denied; we are forced to believe in it. People really die; and no longer one by one, but many, often tens of thousands, in a single day. And death is no longer a chance event. To be sure, it still seems a matter of chance whether a bullet hits this man or that; but a second bullet may well hit the survivor; and the accumulation of deaths puts an end to the impression of chance. Life has, indeed, become interesting again; it has recovered its full content.

Here a distinction should be made between two groups – those who themselves risk their lives in battle, and those who have stayed at home and have only to wait for the loss of one of their dear ones by wounds,

1 [The B'nai B'rith lecture version continues at this point: 'In comparison, take what one of our very characteristic Jewish anecdotes expresses: the son falls off a ladder, remains lying there unconscious, and the mother runs to the Rabbi to seek help and advice. "Tell me", asks the Rabbi, "how does a Jewish child come to be on a ladder?"']

disease or infection. It would be most interesting, no doubt, to study the changes in the psychology of the combatants, but I know too little about it. We must restrict ourselves to the second group, to which we ourselves [292] belong. I have said already that in my opinion the bewilderment and the paralysis of capacity, from which we suffer, are essentially determined among other things by the circumstance that we are unable to maintain our former attitude towards death, and have not yet found a new one. It may assist us to do this if we direct our psychological enquiry towards two other relations to death – the one which we may ascribe to primaeval, prehistoric men, and the one which still exists in every one of us, but which conceals itself, invisible to consciousness, in the deeper strata of our mental life.

What the attitude of prehistoric man was towards death is, of course, only known to us by inferences and constructions, but I believe that these methods have furnished us with fairly trustworthy conclusions.

Primaeval man took up a very remarkable attitude towards death. It was far from consistent; it was indeed most contradictory. On the one hand, he took death seriously, recognized it as the termination of life and made use of it in that sense; on the other hand, he also denied death and reduced it to nothing. This contradiction arose from the fact that he took up radically different attitudes towards the death of other people, of strangers, of enemies, and towards his own. He had no objection to someone else's death; it meant the annihilation of someone he hated, and primitive man had no scruples against bringing it about. He was no doubt a very passionate creature and more cruel and more malignant than other animals. He liked to kill, and killed as a matter of course. The instinct [*Instinkt*][T] which is said to restrain other animals from killing and devouring their own species need not be attributed to him.

Hence the primaeval history of mankind is filled with murder. Even today, the history of the world which our children learn at school is essentially a series of murders of peoples. The obscure sense of guilt to which mankind has been subject since prehistoric times, and which in some religions has been condensed into the doctrine of primal guilt, of original sin, is probably the outcome of a blood guilt incurred by prehistoric man. In my book *Totem and Taboo* (1912–13*a*) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of today enables us to deduce it. If the Son of God was obliged to [293] sacrifice His life to redeem mankind from original sin, then by the law of talion, the requital of like by like, that sin must have been a killing, a

murder. Nothing else could call for the sacrifice of a life for its expiation. And if[1] the original sin was an offence against God the Father, the primal crime of mankind must have been a parricide, the killing of the primal father of the primitive human horde, whose mnemic image was later transfigured into a deity.[2]

His own death was certainly just as unimaginable and unreal for primaeval man as it is for any one of us today. But there was for him one case in which the two opposite attitudes towards death collided and came into conflict with each other; and this case became highly important and productive of far-reaching consequences. It occurred when primaeval man saw someone who belonged to him die – his wife, his child, his friend – whom he undoubtedly loved as we love ours, for love cannot be much younger than the lust to kill. Then, in his pain, he was forced to learn that one can die, too, oneself, and his whole being revolted against the admission; for each of these loved ones was, after all, a part of his own beloved ego [*Ichs*][T]. But, on the other hand, deaths such as these pleased him as well, since in each of the loved persons there was also something of the stranger. The law of ambivalence of feeling, which to this day governs our emotional relations with those whom we love most, certainly had a very much wider validity in primaeval times. Thus these beloved dead had also been enemies and strangers who had aroused in him some degree of hostile feeling.[3]

Philosophers have declared that the intellectual enigma presented to primaeval man by the picture of death forced him to reflection, and thus became the starting point of all speculation. I believe that here the philosophers are thinking too philosophically, and giving too little consideration to the motives that were primarily operative. I should like therefore to limit and correct their assertion. In my view, primaeval man must have triumphed beside the body of his slain enemy, without being led to rack his brains about the enigma of life and death. What released the spirit of enquiry in man was not the intellectual enigma, and not every death, but the conflict of feeling at the death of loved yet alien and
[294] hated persons. Of this conflict of feeling psychology was the first offspring. Man could no longer keep death at a distance, for he had tasted

1 [This 'if' was accidentally omitted in the *SE* translation.]

2 Cf. *Totem and Taboo*, Essay IV [*RSE*, **13**, 135 ff.]. [The following additional paragraph appears at this point in the B'nai B'rith version: 'Incidentally, let me point out that the doctrine of original sin is not a Christian innovation; it is a part of the primal belief that has continued for ages in subterranean religious currents. Judaism has carefully pushed aside these dark memories of mankind, and perhaps for this very reason has disqualified itself as a world religion.']

3 Ibid., Essay II [*RSE*, **13**, 62 ff.].

it in his pain about the dead; but he was nevertheless unwilling to acknowledge it, for he could not conceive of himself as dead. So he devised a compromise: he conceded the fact of his own death as well, but denied it the significance of annihilation – a significance which he had had no motive for denying where the death of his enemy was concerned. It was beside the dead body of someone he loved that he invented spirits [*Geister*], and his sense of guilt at the satisfaction mingled with his sorrow turned these newborn spirits into evil demons that had to be dreaded. The changes brought about by death suggested to him the division of the individual into a body and a soul [*Seelen*][T] – originally several souls – and in this way his train of thought ran parallel with the process of disintegration which sets in with death. His persisting memory of the dead became the basis for assuming other forms of existence and gave him the conception of a life continuing after apparent death.

These subsequent existences were at first no more than appendages to the existence which death had brought to a close – shadowy, empty of content, and valued at little until later times; they still bore the character of wretched makeshifts. We may recall the answer made to Odysseus by the soul of Achilles:

> 'For of old, when thou wast alive, we Argives honoured thee even as the gods, and now that thou art here, thou rulest mightily over the dead. Wherefore grieve not at all that thou art dead, Achilles.'
>
> So I spoke, and he straightway made answer and said: 'Nay, seek not to speak soothingly to me of death, glorious Odysseus. I should choose, so I might live on earth, to serve as the hireling of another, of some portionless man whose livelihood was but small, rather than to be lord over all the dead that have perished.'[1]

Or in Heine's powerful and bitter parody:

> Der kleinste lebendige Philister
> Zu Stuckert am Neckar
> Viel glücklicher ist er
> Als ich, der Pelide, der tote Held,
> Der Schattenfürst in der Unterwelt.[2]

It was only later that religions succeeded in representing this afterlife [295]
as the more desirable, the truly valid one, and in reducing the life which

1 *Odyssey* XI, 484–91. [Trans. A. T. Murray.]

2 [Literally 'The smallest living Philistine at Stuckert-am-Neckar is far happier than I, the son of Peleus, the dead hero, the shadow-prince in the underworld.' The closing lines of 'Der Scheidende', one of the very last of Heine's poems.]

is ended by death to a mere preparation. After this, it was no more than consistent to extend life backwards into the past as well,[1] to form the notion of earlier existences, of the transmigration of souls and of reincarnation, all with the purpose of depriving death of its meaning as the termination of life. So early did the denial of death, which we have described [p. 289 above] as a 'conventional and cultural attitude', have its origin.[2]

What came into existence beside the dead body of the loved one was not only the doctrine of the soul, the belief in immortality and a powerful source of man's sense of guilt, but also the earliest ethical commandments.[3] The first and most important prohibition made by the awakening conscience was: 'Thou shalt not kill.' It was acquired in relation to dead people who were loved, as a reaction against the satisfaction of the hatred hidden behind the grief for them; and it was gradually extended to strangers who were not loved, and finally even to enemies.

This final extension of the commandment is no longer experienced by civilized man. When the furious struggle of the present war has been decided, each one of the victorious fighters[4] will return home joyfully to his wife and children, unchecked and undisturbed by thoughts of the enemies he has killed whether at close quarters or at long range. It is worthy of note that the primitive races which still survive in the world, and are undoubtedly closer than we are to primaeval man, act differently in this respect, or did until they came under the influence of our civilization. Savages – Australians, Bushmen, Tierra del Fuegans – are far from being remorseless murderers; when they return victorious from the war-path they may not set foot in their villages or touch their wives till they have atoned for the murders they committed in war by penances which are often long and tedious. It is easy, of course, to attribute this to their superstition: the savage still goes in fear of the avenging spirits of the slain. But the spirits of his slain enemy are nothing but the expression of

1 [The word '*auch*' here was overlooked in the *CP* and *SE* translations.]

2 [The last sentence corresponds to the following four in the B'nai B'rith version: 'It is very remarkable that our Holy Scriptures have taken no account of this human need for a guarantee of continued existence. On the contrary, at one point it is said: "Only the living praise God." I believe – and you certainly know more about it than I do – that different stances have been taken on the doctrine of immortality in popular Jewish religion and in the literature connected with the Holy Scriptures. But I would like to include this point too amongst those factors that prevented the Jewish religion from taking the place of the other ancient religions after their decline.' – The biblical reference here is probably to *Psalms* cxv, 17, or *Isaiah* xxxviii, 18–19.]

3 [In the B'nai B'rith version: 'the fear of death and the earliest ethical commandments'.]

4 [In the B'nai B'rith version: 'victorious German soldiers'.]

his bad conscience about his blood guilt; behind this superstition there lies concealed a vein of ethical sensitiveness which has been lost by us civilized men.[1]

Pious souls, no doubt, who would like to believe that our nature is remote from any contact with what is evil and base, will not fail to use [296] the early appearance and the urgency of the prohibition against murder as the basis for gratifying conclusions as to the strength of the ethical impulses which must have been implanted in us. Unfortunately, this argument proves even more for the opposite view. So powerful a prohibition can only be directed against an equally powerful impulse. What no human soul desires stands in no need of prohibition;[2] it is excluded automatically. The very emphasis laid on the commandment 'Thou shalt not kill' makes it certain that we spring from an endless series of generations of murderers, who had the lust for killing in their blood, as, perhaps, we ourselves have today. Mankind's ethical strivings, whose strength and significance we need not in the least depreciate, were acquired in the course of man's history; since then they have become, though unfortunately only in a very variable amount, the inherited property of contemporary men.[3]

Let us now leave primaeval man, and turn to the unconscious in our own mental life. Here we depend entirely upon the psychoanalytic method of investigation, the only one which reaches to such depths.[4] What, we ask, is the attitude of our unconscious towards the problem of

1 Cf. *Totem and Taboo* (1912–13*a*) [*RSE*, **13**, 67 ff.].

2 Cf. Frazer's brilliant argument quoted in *Totem and Taboo* [ibid., **13**, 115].

3 [This paragraph corresponds to the following two in the B'nai B'rith version:

'Let me tarry a moment longer on this the oldest of ethical commandments: "Thou shalt not kill". Its early appearance and its urgency alike permit us to draw an important conclusion. The claim has been made that an instinctual [*instinktiver*] aversion to bloodshed is deeply implanted within us. Pious souls like to believe it. Now, we could easily put this claim to the test. We have really good cases of instinctual [*instinktiven*], inherited aversions of this sort at our disposal.

'Let me transport you to one of our lovely health resorts in the South. There, there are vineyards with magnificent grapes. In these vineyards there are snakes, too, thick black ones called Aesculapian snakes (completely harmless animals, incidentally). There are also notices of prohibition in these vineyards. We read one of these notices, upon which it is written: "It is strictly prohibited for guests of the resort to stick the head or tail of an Aesculapian snake into their mouths." Wouldn't you say, "What a senseless and unnecessary prohibition. No such thing would occur to anyone anyway." You would be right. We also read other notices that warn against the picking of grapes. We would consider this prohibition more justified. – No, don't let us lead ourselves astray. We possess no instinctual [*instinktiven*] aversion to bloodshed. We are descendants of an endless series of generations of murderers. The lust for killing is infixed in our blood, and soon, perhaps, we shall be able to track it down in other places too.']

4 [This sentence reads as follows in the B'nai B'rith version: 'Perhaps you are aware that we are in possession of an investigative procedure which enables us to discover what is happening in the deeper strata of the mind, hidden from consciousness – that is to say, of a sort of *deep-sea psychology*.']

death? The answer must be: almost exactly the same as that of primaeval man. In this respect, as in many others, the man of prehistoric times survives unchanged in our unconscious. Our unconscious, then, does not believe in its own death; it behaves as if it were immortal. What we call our 'unconscious' – the deepest strata of our minds, made up of drive impulses – knows nothing that is negative, and no negation; in it contradictories coincide. For that reason it does not know its own death, for to that we can give only a negative content. Thus there is nothing driven [*Triebhaftes*] in us which responds to a belief in death. This may even be the secret of heroism. The rational grounds for heroism rest on a judgement that the subject's own life cannot be so precious as certain abstract and general goods. But more frequent, in my view, is the instinctive [*instinktive*] and impulsive heroism which knows no such reasons, and simply flouts danger in the spirit of Anzengruber's *Steinklopferhans*:
[297] 'Nothing can happen to *me*'.[1] Or else those reasons only serve to clear away the hesitations which might hold back the heroic reaction that corresponds to the unconscious. The fear of death, which dominates us oftener than we ourselves know, is on the other hand something secondary, and is usually the outcome of a sense of guilt.[2]

On the other hand, for strangers and for enemies we do acknowledge death, and consign them to it quite as readily and unhesitatingly as did primaeval man. There is, it is true, a distinction here which will be pronounced decisive so far as real life is concerned. Our unconscious does not carry out the killing; it merely thinks it and wishes it. But it would be wrong so completely to undervalue this *psychical* reality as compared with *factual* reality. It is significant and momentous enough. In our unconscious impulses we daily and hourly get rid of anyone who stands in our way, of anyone who has offended and injured us. The expression 'Devil take him!', which so often comes to people's lips in joking anger and which really means 'Death take him!', is in our unconscious a serious and powerful death wish. Indeed, our unconscious will murder even for trifles; like the ancient Athenian code of Draco, it knows no other punishment for crime than death. And this has a certain consistency, for every injury to our almighty and autocratic ego is at bottom a crime of *lèse-majesté*.

And so, if we are to be judged by our unconscious wishful impulses, we ourselves are, like primaeval man, a gang of murderers. It is fortunate

1 ['Hans the Stone-Breaker' – a character in a comedy by the Viennese dramatist Ludwig Anzengruber (1839–89).]

2 [Fuller discussions of the fear of death can be found in *The Ego and the Id* (1923*b*), *RSE*, **19**, 47–53, and in Chapter VII of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 114–15.]

that all these wishes do not possess the potency that was attributed to them in primaeval times;[1] in the cross-fire of mutual curses mankind would long since have perished, the best and wisest of men and the loveliest and fairest of women with the rest.

Psychoanalysis finds as a rule no credence among laymen for assertions such as these. They reject them as calumnies which are confuted by conscious experience, and they adroitly overlook the faint indications by which even the unconscious is apt to betray itself to consciousness. It is therefore relevant to point out that many thinkers who could not have been influenced by psychoanalysis have quite definitely accused our unspoken thoughts of being ready, heedless of the prohibition against murder, to get rid of anything which stands in our way. From many examples of this I will choose one that has become famous: [298]

In *Le Père Goriot*, Balzac alludes to a passage in the works of J.-J. Rousseau where that author asks the reader what he would do if – without leaving Paris and of course without being discovered – he could kill, with great profit to himself, an old mandarin in Peking by a mere act of will. Rousseau implies that he would not give much for the life of that dignitary. '*Tuer son mandarin*' has become a proverbial phrase for this secret readiness, present even in modern man.[2]

There are also a whole number of cynical jokes and anecdotes which reveal the same tendency – such, for instance, as the words attributed to a husband: 'If one of us two dies, I shall move to Paris.'[3] Such cynical jokes would not be possible unless they contained an unacknowledged truth which could not be admitted if it were expressed seriously and[4] without disguise. In jest – it is well known – one may even tell the truth.

1 See *Totem and Taboo*, Essay III [*RSE*, **13**, 84.].

2 [A reference to this anecdote of the mandarin cannot be found in Rousseau's work. Cf. *Oeuvres complètes de Freud*, **13**, 155.]

3 [This is also quoted in *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 434.]

4 [This paragraph was expanded in the B'nai B'rith lecture: 'I can convey the same unpleasant truth to you in a form that could even give you pleasure. I know that you all like to be told jokes, and I hope that you have not been too much preoccupied with the problem of where the satisfaction in jokes comes from. There is a certain class of jokes that we call *cynical*; they are not the worst or weakest of jokes. I can reveal to you that part of the secret of these jokes is to dress up a hidden or unacknowledged truth – something that is, in and of itself, offensive – in such a way that one is actually able to enjoy it. By way of certain formal arrangements, you are compelled to laugh, your judgement is disarmed, and the truth which would otherwise have been tracked down is smuggled through. You know, for instance, the story about the man who is delivered of a funeral notice whilst in company, which he put in his pocket, unread. "Wouldn't you rather have a look to see who it is that has died?" someone asks him. "What for?" he answers, "it's fine by me no matter who it is." Or the one about the husband who says, regarding his wife: "If one of us dies, I shall move to Paris." These are cynical jokes, and they would not be possible unless they contained an unacknowledged truth. In jest – it is well known – one may even tell the truth.']

Just as for primaeval man, so also for our unconscious, there is one case in which the two opposing attitudes towards death, the one which acknowledges it as the annihilation of life and the other which denies it as unreal, collide and come into conflict. This case is the same as in primal ages: the death, or the risk of death, of someone we love, a parent or a partner in marriage, a brother or sister, a child or dear friend. These loved ones are, on the one hand, an inner possession, components of our own ego; but, on the other hand, they are partly strangers, even enemies. With the exception of only a very few situations, there adheres to the tenderest and most intimate of our love relations a small portion of hostility which can excite an unconscious death wish. But this conflict due to ambivalence does not now, as it did then, lead to the doctrine of the soul and to ethics, but to neurosis, which affords us deep insight into normal mental life as well. How often have physicians who practise psychoanalysis had to deal with the symptom of an exaggerated worry over the well-being of relatives, or with entirely unfounded self-reproaches after the death
[299] of a loved person. The study of such phenomena has left them in no doubt about the extent and importance of unconscious death wishes.

The layman feels an extraordinary horror at the possibility of such feelings, and takes this aversion as a legitimate ground for disbelief in the assertions of psychoanalysis. Mistakenly, I think. No depreciation of feelings of love is intended, and there is, in fact, none. It is indeed foreign to our intelligence as well as to our feelings thus to couple love and hate; but Nature, by making use of this pair of opposites, contrives to keep love ever vigilant and fresh, so as to guard it against the hate which lurks behind it. It might be said that we owe the fairest flowerings of our love to the reaction against the hostile impulse which we sense within us.

To sum up: our unconscious is just as inaccessible to the idea of our own death, just as murderously inclined towards strangers, just as divided (that is, ambivalent) towards those we love, as was primaeval man. But how far we have moved from this primal state in the conventional and cultural attitude towards death!

It is easy to see how war impinges on this dichotomy. It strips us of the later accretions of civilization, and lays bare the primal man in each of us. It compels us once more to be heroes who cannot believe in their own death; it stamps strangers as enemies, whose death is to be brought about or desired; it tells us to disregard the death of those we love. But war cannot be abolished; so long as the

conditions of existence among nations are so different and their mutual repulsion so violent, there are bound to be wars. The question then arises: Is it not we who should give in, who should adapt to war? Should we not confess that in our civilized attitude towards death we are once again living psychologically beyond our means, and should we not rather turn back and recognize the truth? Would it not be better to give death the place in reality and in our thoughts which is its due, and to give a little more prominence to the unconscious attitude towards death which we have hitherto so carefully suppressed? This hardly seems an advance to higher achievement, but rather in some respects a backward step – a regression; but it has the advantage of taking the truth more into account, and of making life more tolerable for us once again. To tolerate life remains, after all, the first duty of all living beings. Illusion becomes valueless if it makes this harder for us.

We recall the old saying: *Si vis pacem, para bellum*. (If you want to preserve peace, arm for war.) [300]

It would be in keeping with the times to alter it: *Si vis vitam, para mortem*. (If you want to endure life, prepare yourself for death.)

APPENDIX

LETTER TO FREDERIK VAN EEDEN

[301] This letter was written by Freud at the end of 1914, a few months after the outbreak of the First World War and a few months before the composition of his 'Thoughts for the Times on War and Death'. Van Eeden, to whom the letter was addressed, was a Dutch psychopathologist, better known, however, as a man of letters. He was a long-standing acquaintance of Freud's, although never accepting his views. The letter was first published in German by van Eeden in an Amsterdam weekly periodical, *De Amsterdammer*,[1] on January 17, 1915 (No. 1960, p. 3). The German text was reprinted in *GW*, **Nachtr.**, 697–8. An English translation is included in the second volume of Ernest Jones's life of Freud (1955, 413). The translation which follows (reprinted, with minor revisions, from the *SE*) is the same, apart from a few verbal changes.

Vienna, December 28, 1914

Dear Dr van Eeden,

I venture, under the impact of the war, to remind you of two theses which have been put forward by psychoanalysis and which have undoubtedly contributed to its unpopularity.

Psychoanalysis has inferred from the dreams and parapraxes [*Fehlhandlungen*][T] of healthy people, as well as from the symptoms of neurotics, that the primitive, savage and evil impulses of mankind have not vanished in any of its individual members, but persist, although in a repressed state, in the unconscious (to use our technical terms), and lie in wait for opportunities of becoming active once more. It has further taught us that our intellect is a feeble and dependent thing, a plaything
Trieb and tool of our drives [*Triebneigungen*][T] and affects, and that we are all compelled to behave cleverly or stupidly according to the commands of our [emotional] attitudes and internal resistances.

If you will now observe what is happening in this war – the cruelties and injustices for which the most civilized nations are responsible, the
[302] different way in which they judge their own lies and wrongdoings and those of their enemies, and the general lack of insight which

1 [The periodical's name was later changed to *De Groene Amsterdammer*.]

prevails – you will have to admit that psychoanalysis has been right in both its theses.

It may not have been entirely original in this; many thinkers and students of mankind have made similar assertions. But our science has worked out both of them in detail and has employed them to throw light on many psychological puzzles.

I hope we shall meet again in happier times.

Yours very sincerely,
Sigm. Freud

Freud with daughter Anna in the Dolomites, 1913

Freud with daughter Anna in the Dolomites, 1913

In a letter to Sándor Ferenczi dated July 9, 1913, Freud wrote: 'My closest companion will be my little daughter, who is developing very well at the moment (you will long ago have guessed the subjective condition for the "Theme of the Three Caskets".' Freud was referring to the fact that he himself had three daughters.

The present translation is a lightly revised reprint of the *SE* version.

This essay was written in November, 1915, at the invitation of the Berliner Goethebund (the Berlin Goethe Society) for a commemorative volume they issued in the following year under the title of *Das Land Goethes* (Goethe's Country). This elaborately produced volume included a large number of contributions from well-known writers and artists past and present, such as von Bülow, von Brentano, Ricarda Huch, Hauptmann and Liebermann. The German original (apart from the picture it gives of Freud's feelings about the war, which was then in its second year) is excellent evidence of his literary powers. It is of interest to note that the essay includes a statement of the theory of mourning contained in 'Mourning and Melancholia' (1916–17*g* [1915]), which Freud had written some months before, but which was not published until two years later.

ON TRANSIENCE

Not long ago I went on a summer walk through a smiling countryside in the company of a taciturn friend and of a young but already famous poet.[1] The poet admired the beauty of the scene around us but felt no joy in it. He was disturbed by the thought that all this beauty was fated to extinction, that it would vanish when winter came, like all human beauty and all the beauty and splendour that men have created or may create. All that he would otherwise have loved and admired seemed to him to be shorn of its worth by the transience which was its doom. [305]

The proneness to decay of all that is beautiful and perfect can, as we know, give rise to two different impulses in the mind [*seelische Regungen*][T]. The one leads to the aching despondency felt by the young poet, while the other leads to rebellion against the fact asserted. No! it is impossible that all this loveliness of Nature and Art, of the world of our sensations and of the world outside, will really fade away into nothing. It would be too senseless and too presumptuous to believe it. Somehow or other this loveliness must be able to persist and to escape all the powers of destruction. *Seele*

But this demand for immortality is a product of our wishes too unmistakable to lay claim to reality: what is painful may nonetheless be true. I could not see my way to dispute the transience of all things, nor could I insist upon an exception in favour of what is beautiful and perfect. But I did dispute the pessimistic poet's view that the transience of what is beautiful involves any loss in its worth.

On the contrary, an increase! Transience value is scarcity value in time. Limitation in the possibility of an enjoyment raises the value of the enjoyment. It was incomprehensible, I declared, that the thought of the transience of beauty should interfere with our joy in it. As regards the beauty of Nature, each time it is destroyed by winter it comes again next year, so that in relation to the length of our lives it can in fact be

1 [Freud spent part of August, 1913, in the Dolomites with Lou Andreas-Salomé and Rainer Maria Rilke. Cf. Lehmann (1966).]

regarded as eternal. The beauty of the human form and face vanish for
[306] ever in the course of our own lives, but their evanescence only lends them a fresh charm. A flower that blossoms only for a single night does not seem to us on that account less lovely. Nor can I understand any better why the beauty and perfection of a work of art or of an intellectual achievement should lose its worth because of its temporal limitation. A time may indeed come when the pictures and statues which we admire today will crumble to dust, or a race of men may follow us who no longer understand the works of our poets and thinkers, or a geological epoch may even arrive when all animate life upon the earth ceases; but since the value of all this beauty and perfection is determined only by its significance for our own emotional lives, it has no need to survive us and is therefore independent of absolute duration.

These considerations appeared to me incontestable; but I noticed that I had made no impression either upon the poet or upon my friend. My failure led me to infer that some powerful emotional factor was at work which was disturbing their judgement, and I believed later that I had discovered what it was. What spoilt their enjoyment of beauty must have been a revolt in their minds against mourning. The idea [*Vorstellung*]^{T} that all this beauty was transient was giving these two sensitive minds a foretaste of mourning over its decease; and, since the mind instinctively [*instinktiv*]^{T} recoils from anything that is painful, they felt their enjoyment of beauty interfered with by thoughts of its transience.

Mourning over the loss of something that we have loved or admired seems so natural to the layman that he regards it as self-evident. But to psychologists mourning is a great riddle, one of those phenomena which cannot themselves be explained but to which other obscurities can be traced back. We possess, as it seems, a certain amount of capacity for love – what we call libido – which in the earliest stages of development is directed towards our own ego. Later, though still at a very early time, this libido is diverted from the ego on to objects, which are thus in a sense taken into our ego [*Ich*]^{T}. If the objects are destroyed or if they are lost to us, our capacity for love (our libido) is once more liberated; and it can then either take other objects instead or can temporarily return to the ego. But why it is that this detachment of libido from its objects should be such a painful process is a mystery to us and we have not hitherto been able to frame any hypothesis to account for it. We only see
[307] that libido clings to its objects and will not renounce those that are lost even when a substitute lies ready to hand. Such then is mourning.

My conversation with the poet took place in the summer before the war. A year later the war broke out and robbed the world of its beauties. It destroyed not only the beauty of the countrysides through which it passed and the works of art which it met with on its path but it also shattered our pride in the achievements of our civilization [*Kultur*][T], our admiration for many philosophers and artists and our hopes of a final triumph over the differences between nations and races. It tarnished the lofty impartiality of our science, it revealed our drives [*Triebleben*][T] in *Trieb* all their nakedness and let loose the evil spirits within us which we thought had been tamed for ever by centuries of continuous education by the noblest minds. It made our country small again and made the rest of the world far remote. It robbed us of very much that we had loved, and showed us how ephemeral were many things that we had regarded as changeless.

We cannot be surprised that our libido, thus bereft of so many of its objects, has clung with all the greater intensity to what is left to us, that our love of our country, our affection for those nearest us and our pride in what is common to us have suddenly grown stronger. But have those other possessions, which we have now lost, really ceased to have any worth for us because they have proved so perishable and so unresistant? To many of us this seems to be so, but once more wrongly, in my view. I believe that those who think thus, and seem ready to make a permanent renunciation because what was precious has proved not to be lasting, are simply in a state of mourning for what is lost. Mourning, as we know, however painful it may be, comes to a spontaneous end. When it has renounced everything that has been lost, then it has consumed itself, and our libido is once more free (insofar as we are still young and active) to replace the lost objects with fresh ones equally or still more precious. It is to be hoped that the same will be true of the losses caused by this war. When once the mourning is over, it will be found that our high opinion of the riches of civilization has lost nothing from our discovery of their fragility. We shall build up again all that war has destroyed, and perhaps on firmer ground and more lastingly than before.

SOME CHARACTER-TYPES MET WITH IN PSYCHOANALYTIC WORK

(1916)

These three essays were published in the last issue of *Imago* for the year 1916. The third of them, although the shortest, has produced as many repercussions as any of Freud's non-medical writings, for it has thrown an entirely fresh light on the problems of the psychology of crime.

SOME CHARACTER-TYPES MET WITH IN PSYCHOANALYTIC WORK

When a doctor carries out the psychoanalytic treatment of a neurotic, [311]
his interest is by no means directed in the first instance to the patient's character. He would much rather know what the symptoms mean, what drive impulses [*Triebregungen*][T] are concealed behind them and are satis- *Trieb, Regung*
fied by them, and what course was followed by the mysterious path that has led from the drive wishes to the symptoms. But the technique which he is obliged to follow soon compels him to direct his immediate curiosity towards other objectives. He observes that his investigation is threatened by resistances set up against him by the patient, and these resistances he may justly count as part of the latter's character. This now acquires the first claim on his interest.

What opposes the doctor's efforts is not always those traits of character which the patient recognizes in himself and which are attributed to him by people round him. Peculiarities in him which he had seemed to possess only to a modest degree are often brought to light in surprisingly increased intensity, or attitudes reveal themselves in him which had not been betrayed in other relations of life. The pages which follow will be devoted to describing and tracing back a few of these surprising traits of character.

I
THE 'EXCEPTIONS'

Psychoanalytic work is continually confronted with the task of inducing the patient to renounce an immediate and directly attainable yield of pleasure [*Lustgewinn*][T]. He is not asked to renounce all pleasure; that *Lust*
could not, perhaps, be expected of any human being, and even religion is obliged to support its demand that earthly pleasure shall be set aside by promising that it will provide instead an incomparably greater amount of superior pleasure in another world. No, the patient is only asked to renounce such satisfactions as will inevitably have detrimental [312]

consequences. His privation is only to be temporary; he has only to learn to exchange an immediate yield of pleasure for a better assured, even though a postponed one. Or, in other words, under the doctor's guidance he is asked to make the advance from the pleasure principle to the reality principle by which the mature human being is distinguished from the child. In this educative process [*Erziehungswerk*][T], the doctor's clearer insight can hardly be said to play a decisive part; as a rule, he can only tell his patient what the latter's own reason can tell him. But it is not the same to know a thing in one's own mind and to hear it from someone outside. The doctor plays the part of this effective outsider; he makes use of the influence which one human being exercises over another. Or – recalling that it is the habit of psychoanalysis to replace what is derivative and etiolated with what is original and basic – let us say that the doctor, in his educative work, makes use of one of the components of love. In this work of after-education [*Nacherziehung*], he is probably doing no more than repeat the process which made education of any kind possible in the first instance. Side by side with the exigencies of life, love is the great educator; and it is by the love of those nearest him that the incomplete human being is induced to respect the decrees of necessity and to spare himself the punishment that follows any infringement of them.

Erziehung

When in this way one asks the patient to make a provisional renunciation of some pleasurable satisfaction, to make a sacrifice, to show his readiness to accept some temporary suffering for the sake of a better end, or even merely to make up his mind to submit to a necessity which applies to everyone, one comes upon individuals who resist such an appeal on a special ground. They say that they have renounced enough and suffered enough, and have a claim to be spared any further demands; they will submit no longer to any disagreeable necessity, for they are *exceptions* and, moreover, intend to remain so. In one such patient this claim was magnified into a conviction that a special providence watched over him, which would protect him from any painful sacrifices of the sort. The doctor's arguments will achieve nothing against an inner confidence which expresses itself as strongly as this; even *his* influence, indeed, is powerless at first, and it becomes clear to him that he must discover the sources from which this damaging prepossession is being fed.

[313] Now it is no doubt true that everyone would like to consider himself an 'exception' and claim privileges over others. But precisely because of this there must be a particular reason, and one not universally present, if someone actually proclaims himself an exception and

behaves as such. This reason may be of more than one kind; in the cases I investigated I succeeded in discovering a common peculiarity in the earlier experiences of these patients' lives. Their neuroses were connected with some experience or suffering to which they had been subjected in their earliest childhood, one in respect of which they knew themselves to be guiltless, and which they could look upon as an unjust disadvantage imposed upon them. The privileges that they claimed as a result of this injustice, and the rebelliousness it engendered, had contributed not a little to intensifying the conflicts leading to the outbreak of their neurosis. In one of these patients, a woman, the attitude towards life which I am discussing came to a head when she learnt that a painful organic trouble, which had hindered her from attaining her aims in life, was of congenital origin. So long as she looked upon this trouble as an accidental and late acquisition, she bore it patiently; as soon as she found that it was part of an innate inheritance, she became rebellious. The young man who believed that he was watched over by a special providence had in his infancy been the victim of an accidental infection from his wet-nurse, and had spent his whole later life making claims for compensation, an accident pension, as it were, without having any idea on what he based those claims. In his case the analysis, which constructed this event out of obscure mnemic residues and interpretations of the symptoms [*Symptomdeutungen*][T], was confirmed objectively by information from his family. *Deutung*

For reasons which will be easily understood I cannot communicate very much about these or other case histories. Nor do I propose to go into the obvious analogy between deformities of character resulting from protracted sickliness in childhood and the behaviour of whole nations whose past history has been full of suffering. Instead, however, I will take the opportunity of pointing to a figure created by the greatest of poets – a figure in whose character the claim to be an exception is closely bound up with and is motivated by the circumstance of congenital disadvantage.

In the opening soliloquy to Shakespeare's *Richard III*, Gloucester, who subsequently becomes King, says: [314]

> But I, that am not shaped for sportive tricks,
> Nor made to court an amorous looking-glass;
> I that am rudely stamp'd, and want love's majesty
> To strut before a wanton ambling nymph;
> I, that am curtail'd of this fair proportion,

Cheated of feature by dissembling Nature,
Deform'd, unfinish'd, sent before my time
Into this breathing world, scarce half made up,
And that so lamely and unfashionable,
That dogs bark at me as I halt by them;
* * * * *
And therefore, since I cannot prove a lover,
To entertain these fair well-spoken days,
I am determined to prove a villain,
And hate the idle pleasures of these days.

At first glance this tirade may perhaps seem unrelated to our present theme. Richard seems to say nothing more than: 'I find these idle times tedious, and I want to enjoy myself. As I cannot play the lover on account of my deformity, I will play the villain; I will intrigue, murder and do anything else I please.' Such a frivolous motivation could not but stifle any stirring of sympathy in the audience if it were not a screen for something much more serious. Otherwise the play would be psychologically impossible, for the writer must know how to furnish us with a secret background of sympathy for his hero, if we are to admire his boldness and adroitness without inward protest; and such sympathy can only be based on understanding or on a sense of a possible inner fellow feeling for him.

I think, therefore, that Richard's soliloquy does not say everything; it merely gives a hint, and leaves us to fill in what it hints at. When we do so, however, the appearance of frivolity vanishes, the bitterness and minuteness with which Richard has depicted his deformity make their full effect, and we clearly perceive the fellow feeling which compels our sympathy even with a villain like him. What the soliloquy thus means is: 'Nature has done me a grievous wrong in denying me the beauty of form which wins human love. Life owes me reparation for this, and I will see that I get it. I have a right to be an exception, to disregard the scruples by
[315] which others let themselves be held back. I may do wrong myself, since wrong has been done to me.' And now we feel that we ourselves might become like Richard, that on a small scale, indeed, we are already like him. Richard is an enormous magnification of something we find in ourselves as well. We all think we have reason to reproach Nature and our destiny for congenital and infantile disadvantages; we all demand reparation for early wounds to our narcissism, our self-love. Why did not Nature give us the golden curls of Balder or the strength of Siegfried or the lofty brow of genius or the noble profile of aristocracy? Why were we

born in a middle-class home instead of in a royal palace? We could carry off beauty and distinction quite as well as any of those whom we are now obliged to envy for these qualities.

It is, however, a subtle economy of art in the poet that he does not permit his hero to give open and complete expression to all his secret motives. By this means he obliges us to supplement them; he engages our intellectual activity, diverts it from critical reflection and keeps us firmly identified with his hero. A bungler in his place would give conscious expression to all that he wishes to reveal to us, and would then find himself confronted with our cool, untrammelled intelligence, which would preclude any deepening of the illusion.

Before leaving the 'exceptions', however, we may point out that the claim of women to privileges and to exemption from so many of the importunities of life rests upon the same foundation. As we learn from psychoanalytic work, women regard themselves as having been damaged in infancy, as having been undeservedly cut short of something and unfairly treated; and the embitterment of so many daughters against their mother derives, ultimately, from the reproach against her of having brought them into the world as women instead of as men.

II
THOSE WRECKED BY SUCCESS

[316] Psychoanalytic work has furnished us with the thesis that people fall ill of a neurosis as a result of *frustration*[I] [*Versagung*][T]. What is meant is the frustration of the satisfaction of their libidinal wishes, and some digression is necessary in order to make the thesis intelligible. For a neurosis to be generated there must be a conflict between a person's libidinal wishes and the part of his personality we call his ego [*Ich*][T], which is the expression of his drive to self-preservation and which also includes his *ideals* of his personality. A pathogenic conflict of this kind takes place only when the libido tries to follow paths and aims which the ego has long since overcome and condemned and has therefore prohibited for ever; and this the libido only does if it is deprived of the possibility of an ideal ego-syntonic [*ichgerechten*][T] satisfaction. Hence privation, frustration of a real satisfaction, is the first condition for the generation of a neurosis, although, indeed, it is far from being the only one.

So much the more surprising, and indeed bewildering, must it appear when as a doctor one makes the discovery that people occasionally fall ill precisely when a deeply rooted and long-cherished wish has come to fulfilment. It seems then as though they were not able to tolerate their happiness; for there can be no question that there is a causal connection between their success and their falling ill.

I had an opportunity of obtaining an insight into a woman's history, which I propose to describe as typical of these tragic occurrences. She was of good birth and well brought up, but as quite a young girl she could not restrain her zest for life; she ran away from home and roved about the world in search of adventures, till she made the acquaintance of an artist who could appreciate her feminine charms but could also divine, in spite of what she had fallen to, the finer qualities she possessed. He took her to live with him, and she proved a faithful companion to him, and seemed only to need social rehabilitation to achieve complete happiness.

[317] After many years of life together, he succeeded in getting his family reconciled to her, and was then prepared to make her his legal wife. At that moment she began to go to pieces. She neglected the house of which she was now about to become the rightful mistress, imagined herself persecuted by his relatives, who wanted to take her into the family, debarred

1 [See 'Types of Onset of Neurosis' (1912*c*), *RSE*, **12**, 226.]

her lover, through her senseless jealousy, from all social intercourse, hindered him in his artistic work, and soon succumbed to an incurable mental illness.

On another occasion I came across the case of a most respectable man who, himself an academic teacher, had for many years cherished the natural wish to succeed the master who had initiated him into his own studies. When this older man retired, and his colleagues informed him that it was he who was chosen as successor, he began to hesitate, depreciated his merits, declared himself unworthy to fill the position designed for him, and fell into a melancholia which unfitted him for all activity for some years.

Different as these two cases are in other respects, they yet agree in this one point: the illness followed close upon the fulfilment of a wish and put an end to all enjoyment of it.

The contradiction between such experiences and the rule that what induces illness is frustration is not insoluble. It disappears if we make a distinction between an *external* and an *internal* frustration. If the object in which the libido can find its satisfaction is withheld *in reality*, this is an external frustration. In itself it is inoperative, not pathogenic, until an internal frustration is joined to it. This latter must proceed from the ego, and must dispute the access by the libido to other objects, which it now seeks to get hold of. Only then does a conflict arise, and the possibility of a neurotic illness, i.e. of a substitutive satisfaction reached circuitously by way of the repressed unconscious. Internal frustration is potentially present, therefore, in every case, only it does not come into operation until external, real frustration has prepared the ground for it. In those exceptional cases in which people are made ill by success, the internal frustration has operated by itself; indeed it has only made its appearance after an external frustration has been replaced by fulfilment of a wish. At first sight there is something strange about this; but on closer consideration we shall reflect that it is not at all unusual for the ego to tolerate a wish as harmless so long as it exists in phantasy [*Phantasie*]^{T} alone and seems remote from fulfilment, whereas the ego will defend itself hotly [318]
against such a wish as soon as it approaches fulfilment and threatens to become a reality. The distinction between this and familiar situations in neurosis formation is merely that ordinarily it is internal intensifications of the libidinal cathexis [*Libidobesetzung*]^{T} that turn the phantasy, which *Besetzung*
has hitherto been thought little of and tolerated, into a dreaded opponent; while in these cases of ours the signal for the outbreak of conflict is given by a real external change.

Analytic work has no difficulty in showing us that it is forces of conscience which forbid the subject to gain the long-hoped-for advantage from the fortunate change in reality. It is a difficult task, however, to discover the essence and origin of these judging and punishing trends, which so often surprise us by their existence where we do not expect to find them. For the usual reasons I shall not discuss what we know or conjecture on the point in relation to cases of clinical observation, but in relation to figures which great writers have created from the wealth of
Seele their knowledge of the mind [*Seelenkenntnis*][T].

We may take as an example of a person who collapses on reaching success, after striving for it with single-minded energy, the figure of Shakespeare's Lady Macbeth. Beforehand there is no hesitation, no sign of any internal conflict in her, no endeavour but that of overcoming the scruples of her ambitious and yet tender-minded husband. She is ready to sacrifice even her womanliness to her murderous intention, without reflecting on the decisive part which this womanliness must play when the question afterwards arises of preserving the aim of her ambition, which has been attained through a crime.

> Come, you spirits
> That tend on mortal thoughts, unsex me here
> . . . Come to my woman's breasts,
> And take my milk for gall, you murdering ministers!
>
> (Act I, Sc. 5.)

> . . . I have given suck, and know
> How tender 'tis to love the babe that milks me:
> I would, while it was smiling in my face,
> Have pluck'd my nipple from his boneless gums,
> And dashed the brains out, had I so sworn as you
> Have done to this.
>
> (Act I, Sc. 7.)

[319] One solitary faint stirring of reluctance comes over her before the deed:

> . . . Had he not resembled
> My father as he slept, I had done it . . .
>
> (Act II, Sc. 2.)

Then, when she has become queen through the murder of Duncan, she betrays for a moment something like disappointment, something like disillusionment. We cannot tell why.

> . . . Nought's had, all's spent,
> Where our desire is got without content:
> 'Tis safer to be that which we destroy,
> Than by destruction dwell in doubtful joy.
>
> (Act III, Sc. 2.)

Nevertheless, she holds out. In the banqueting scene which follows on these words, she alone keeps her head, cloaks her husband's state of confusion and finds a pretext for dismissing the guests. And then she disappears from view. We next see her in the sleepwalking scene in the last Act, fixated to the impressions of the night of the murder. Once again, as then, she seeks to put heart into her husband:

> 'Fie, my lord, fie! a soldier, and afeard? What need we fear who knows it, when none can call our power to account?'
>
> (Act V, Sc. 1.)

She hears the knocking at the door, which terrified her husband after the deed. But at the same time she strives to 'undo the deed which cannot be undone'. She washes her hands, which are bloodstained and smell of blood, and is conscious of the futility of the attempt. She who had seemed so remorseless seems to have been borne down by remorse. When she dies, Macbeth, who meanwhile has become as inexorable as she had been in the beginning, can only find a brief epitaph for her:

> She should have died hereafter;
> There would have been a time for such a word.
>
> (Act V, Sc. 5.)

And now we ask ourselves what it was that broke this character which had seemed forged from the toughest metal? Is it only disillusionment – the different aspect shown by the accomplished deed[1] – and are we to infer that even in Lady Macbeth an originally gentle and womanly nature [320]
had been worked up to a concentration and high tension which could not endure for long, or ought we to seek for signs of a deeper motivation which will make this collapse more humanly intelligible to us?

It seems to me impossible to come to any decision. Shakespeare's *Macbeth* is a *pièce d'occasion*, written for the accession of James, who

1 [An allusion to two lines in Schiller's *Die Braut von Messina*, Act IV, Scene 5.]

had hitherto been King of Scotland. The plot was ready-made, and had been handled by other contemporary writers, whose work Shakespeare probably made use of in his customary manner. It offered remarkable analogies to the actual situation. The 'virginal' Elizabeth, of whom it was rumoured that she had never been capable of child-bearing and who had once described herself as 'a barren stock',[1] in an anguished outcry at the news of James's birth, was obliged by this very childlessness of hers to make the Scottish king her successor. And he was the son of the Mary Stuart whose execution she, even though reluctantly, had ordered, and who, in spite of the clouding of their relations by political concerns, was nevertheless of her blood and might be called her guest.

The accession of James I was like a demonstration of the curse of unfruitfulness and the blessings of continuous generation. And the action of Shakespeare's *Macbeth* is based on this same contrast.[2]

The Weird Sisters assured Macbeth that he himself should be king, but to Banquo they promised that his children should succeed to the crown. Macbeth is incensed by this decree of destiny. He is not content with the satisfaction of his own ambition. He wants to found a dynasty – not to have murdered for the benefit of strangers. This point is overlooked if Shakespeare's play is regarded only as a tragedy of ambition. It is clear that Macbeth cannot live for ever, and thus there is but one way for him to invalidate the part of the prophecy which opposes him – namely, to
[321] have children himself who can succeed him. And he seems to expect them from his indomitable wife:

> Bring forth men-children only!
> For thy undaunted mettle should compose
> Nothing but males. . . .
>
> (Act I, Sc. 7.)

And equally it is clear that if he is deceived in this expectation he must submit to destiny; otherwise his actions lose all purpose and are transformed into the blind fury of one doomed to destruction, who is resolved to destroy beforehand all that he can reach. We watch Macbeth pass through this development, and at the height of the tragedy we hear Macduff's shattering cry, which has so often been recognized to be ambiguous and which may perhaps contain the key to the change in Macbeth:

> He has no children!
>
> (Act IV, Sc. 3.)

1 Cf. *Macbeth*, Act III, Sc. 1:

> Upon my head they placed a fruitless crown,
> And put a barren sceptre in my gripe,
> Thence to be wrenched with an unlineal hand,
> No son of mine succeeding . . .

2 [Freud had already suggested this in the first edition of *The Interpretation of Dreams* (1900*a*), *RSE*, **4**, 236.]

There is no doubt that this means: 'Only because he is himself childless could he murder my children.' But more may be implied in it, and above all it might lay bare the deepest motive which not only forces Macbeth to go far beyond his own nature, but also touches the hard character of his wife at its only weak point. If one surveys the whole play from the summit marked by these words of Macduff's, one sees that it is sown with references to the father–children relation. The murder of the kindly Duncan is little else than parricide; in Banquo's case, Macbeth kills the father while the son escapes him; and in Macduff's, he kills the children because the father has fled from him. A bloody child, and then a crowned one, are shown him by the witches in the apparition scene; the armed head which is seen earlier is no doubt Macbeth himself. But in the background rises the sinister form of the avenger, Macduff, who is himself an exception to the laws of generation, since he was not born of his mother but ripp'd from her womb.

It would be a perfect example of poetic justice in the manner of the talion if the childlessness of Macbeth and the barrenness of his Lady were the punishment for their crimes against the sanctity of generation – if Macbeth could not become a father because he had robbed children of their father and a father of his children, and if Lady Macbeth suffered the unsexing she had demanded of the spirits of murder. I believe Lady Macbeth's illness, the transformation of her callousness into penitence, [322]
could be explained directly as a reaction to her childlessness, by which she is convinced of her impotence against the decrees of nature, and at the same time reminded that it is through her own fault if her crime has been robbed of the better part of its fruits.

In Holinshed's *Chronicle* (1577), from which Shakespeare took the plot of *Macbeth*, Lady Macbeth is only once mentioned as the ambitious wife who instigates her husband to murder in order that she may herself become queen. There is no mention of her subsequent fate and of the development of her character. On the other hand, it would seem that the change of Macbeth's character into a bloodthirsty tyrant is ascribed to the same motives as we have suggested here. For in Holinshed *ten years* pass between the murder of Duncan, through which Macbeth becomes king, and his further misdeeds; and in these ten years he is shown as a stern but just ruler. It is not until after this lapse of time that the change begins in him, under the influence of the tormenting fear that the prophecy to Banquo may be fulfilled just as the prophecy of his own destiny has been. Only then does he contrive the murder of Banquo, and, as in Shakespeare, is driven from one crime to another. It is not expressly

stated in Holinshed that it was his childlessness which urged him to these courses, but enough time and room is given for that plausible motive. Not so in Shakespeare. Events crowd upon us in the tragedy with breathless haste so that, to judge by the statements made by the characters in it, the course of its action covers about *one week*.[1] This acceleration takes the ground from under all our constructions of the motives for the change in the characters of Macbeth and his wife. There is no time for a long-drawn-out disappointment of their hopes of offspring to break the woman down and drive the man to defiant rage; and the contradiction remains that though so many subtle interrelations in the plot, and between it and its occasion, point to a common origin of them in the theme of childlessness, nevertheless the economy of time in the tragedy expressly precludes a development of character from any motives but those inherent in the action itself.

What, however, these motives can have been which in so short a space
[323] of time could turn the hesitating, ambitious man into an unbridled tyrant, and his steely-hearted instigator into a sick woman gnawed by remorse, it is, in my view, impossible to guess. We must, I think, give up any hope of penetrating the triple layer of obscurity into which the bad preservation of the text, the unknown intention of the dramatist, and the hidden purport of the legend have become condensed. But I should not subscribe to the objection that investigations like these are idle in face of the powerful effect which the tragedy has upon the spectator. The dramatist can indeed, during the representation, overwhelm us by his art and paralyse our powers of reflection; but he cannot prevent us from attempting subsequently [*nachträglich*] to grasp its effect by studying its psychological mechanism. Nor does the contention that a dramatist is at liberty to shorten at will the natural chronology of the events he brings before us, if by the sacrifice of common probability he can enhance the dramatic effect, seem to me relevant in this instance. For such a sacrifice is justified only when it merely interferes with probability,[2] and not when it breaks the causal connection; moreover, the dramatic effect would hardly have suffered if the passage of time had been left indeterminate, instead of being expressly limited to a few days.

One is so unwilling to dismiss a problem like that of *Macbeth* as insoluble that I will venture to bring up a fresh point, which may offer another way out of the difficulty. Ludwig Jekels, in a recent

1 Darmesteter (1881, lxxv).

2 As in Richard III's wooing of Anne beside the bier of the king whom he has murdered.

Shakespearean study,[1] thinks he has discovered a particular technique of the poet's, and this might apply to *Macbeth*. He believes that Shakespeare often splits a character up into two personages, which, taken separately, are not completely understandable and do not become so until they are brought together once more into a unity. This might be so with Macbeth and Lady Macbeth. In that case it would of course be pointless to regard her as an independent character and seek to discover the motives for her change, without considering the Macbeth who completes her. I shall not follow this clue any further, but I should, nevertheless, like to point out something which strikingly confirms this view: the germs of fear [*Angst-keime*][T] which break out in Macbeth on the night of the murder do not develop further in *him* but in *her*.[2] It is he who has the hallucination of the dagger before the crime; but it is she who afterwards falls ill of a mental disorder. It is he who after the murder hears the cry in the house: 'Sleep no more! Macbeth does murder sleep . . .' and so 'Macbeth shall sleep no more'; but we never hear that *he* slept no more, while the queen, as we see, rises from her bed and, talking in her sleep, betrays her guilt. It is he who stands helpless with bloody hands, lamenting that 'all great Neptune's ocean' will not wash them clean, while she comforts him: 'A little water clears us of this deed'; but later it is she who washes her hands for a quarter of an hour and cannot get rid of the bloodstains: 'All the perfumes of Arabia will not sweeten this little hand.' Thus what he feared in his pangs of conscience is fulfilled in her; she becomes all remorse and he all defiance. Together they exhaust the possibilities of reaction to the crime, like two disunited parts of a single psychical individuality, and it may be that they are both copied from a single prototype.

[324] *Angst*

If we have been unable to give any answer to the question why Lady Macbeth should collapse after her success, we may perhaps have a better chance when we turn to the creation of another great dramatist, who loves to pursue problems of psychological responsibility with unrelenting rigour.

Rebecca Gamvik, the daughter of a midwife, has been brought up by her adopted father, Dr West, to be a freethinker and to despise the restrictions which a morality founded on religious belief seeks to impose on the desires of life. After the doctor's death she finds a position at

1 [This does not appear to have been published. In a later paper on *Macbeth* Jekels (1917) barely refers to this theory, apart from quoting the present paragraph. In a still later paper, on 'The Psychology of Comedy', Jekels (1926) returns to the subject, but again very briefly.]

2 Cf. Darmesteter (1881, lxxv).

Rosmersholm, the home for many generations of an ancient family whose members know nothing of laughter and have sacrificed joy to a rigid fulfilment of duty. Its occupants are Johannes Rosmer, a former pastor, and his invalid wife, the childless Beata. Overcome by 'a wild, uncontrollable passion'[1] for the love of the high-born Rosmer, Rebecca resolves to remove the wife who stands in her way, and to this end makes use of her 'fearless, free will', which is restrained by no scruples. She
[325] contrives that Beata shall read a medical book in which the aim of marriage is represented to be the begetting of offspring, so that the poor woman begins to doubt whether her own marriage is justifiable. Rebecca then hints that Rosmer, whose studies and ideas she shares, is about to abandon the old faith and join the 'party of enlightenment'; and, after she has thus shaken the wife's confidence in her husband's moral integrity, gives her finally to understand that she, Rebecca, will soon leave the house in order to conceal the consequences of her illicit intercourse with Rosmer. The criminal scheme succeeds. The poor wife, who has passed for depressed and irresponsible, throws herself from the path beside the mill into the mill race, possessed by the sense of her own worthlessness and wishing no longer to stand between her beloved husband and his happiness.

For more than a year Rebecca and Rosmer have been living alone at Rosmersholm in a relationship which he wishes to regard as a purely intellectual and ideal friendship. But when this relationship begins to be darkened from outside by the first shadow of gossip, and at the same time tormenting doubts arise in Rosmer about the motives for which his wife put an end to herself, he begs Rebecca to become his second wife, so that they may counter the unhappy past with a new living reality (Act II). For an instant she exclaims with joy at his proposal, but immediately afterwards declares that it can never be, and that if he urges her further she will 'go the way Beata went'. Rosmer cannot understand this rejection; and still less can we, who know more of Rebecca's actions and designs. All we can be certain of is that her 'no' is meant in earnest.

How could it come about that the adventuress with the 'fearless, free will', who forged her way ruthlessly to her desired goal, should now refuse to pluck the fruit of success when it is offered to her? She herself gives us the explanation in the fourth Act: '*This* is the terrible part of it: that now, when all life's happiness is within my grasp – my heart is changed and my own past cuts me off from it.' That is to say, she has in

1 [The quotations are based on William Archer's English translation.]

the meantime become a different being: her conscience has awakened, she has acquired a sense of guilt which debars her from enjoyment.

And what has awakened her conscience? Let us listen to her herself, and then consider whether we can believe her entirely. 'It is the Rosmer view of life – or your view of life at any rate – that has infected my will. . . . And made it sick. Enslaved it to laws that had no power over me [326] before. You – life with you – has ennobled my mind.'

This influence, we are further to understand, has only become effective since she has been able to live alone with Rosmer: 'In quiet – in solitude – when you showed me all your thoughts without reserve – every tender and delicate feeling, just as it came to you – *then* the great change came over me.'

Shortly before this she has lamented the other aspect of the change: 'Because Rosmersholm has sapped my strength. My old fearless will has had its wings clipped here. It is crippled! The time is past when I had courage for anything in the world. I have lost the power of action, Rosmer.'

Rebecca makes this declaration after she had revealed herself as a criminal in a voluntary confession to Rosmer and Rector Kroll, the brother of the woman she has got rid of. Ibsen has made it clear by small touches of masterly subtlety that Rebecca does not actually tell lies, but is never entirely straightforward. Just as, in spite of all her freedom from prejudices, she has understated her age by a year, so her confession to the two men is incomplete, and as a result of Kroll's insistence it is supplemented on some important points. Hence it is open to us to suppose that her explanation of her renunciation exposes one motive only to conceal another.

Certainly, we have no reason to disbelieve her when she declares that the atmosphere of Rosmersholm and her association with the high-minded Rosmer have ennobled – and crippled – her. She is here expressing what she knows and has felt. But this is not necessarily all that has happened in her, nor need she have understood all that has happened. Rosmer's influence may only have been a cloak, which concealed another influence that was operative, and a remarkable indication points in this other direction.

Even after her confession, Rosmer, in their last conversation which brings the play to an end, again beseeches her to be his wife. He forgives her the crime she has committed for love of him. And now she does not answer, as she should, that no forgiveness can rid her of the feeling of guilt she has incurred from her malignant deception of poor Beata; but

she charges herself with another reproach which affects us as coming strangely from this freethinking woman, and is far from deserving the
[327] importance which Rebecca attaches to it: 'Dear – never speak of this again! It is impossible! For you must know, Rosmer, I have a – a past behind me.' She means, of course, that she has had sexual relations with another man; and we do not fail to observe that these relations, which occurred at a time when she was free and accountable to nobody, seem to her a greater hindrance to the union with Rosmer than her truly criminal behaviour to his wife.

Rosmer refuses to hear anything about this past. We can guess what it was, though everything that refers to it in the play is, so to speak, subterranean and has to be pieced together from hints. But nevertheless they are hints inserted with such art that it is impossible to misunderstand them.

Between Rebecca's first refusal and her confession something occurs which has a decisive influence on her future destiny. Rector Kroll arrives one day at the house on purpose to humiliate Rebecca by telling her that he knows she is an illegitimate child, the daughter of the very Dr West who adopted her after her mother's death. Hate has sharpened his perceptions, yet he does not suppose that this is any news to her. 'I really did not suppose you were ignorant of this, otherwise it would have been very odd that you should have let Dr West adopt you . . .' 'And then he takes you into his house – as soon as your mother dies. He treats you harshly. And yet you stay with him. You know that he won't leave you a halfpenny – as a matter of fact you got only a case of books – and yet you stay on; you bear with him; you nurse him to the last.' . . . 'I attribute your care for him to the natural filial instinct [*Instinkt*] of a daughter. Indeed, I believe your whole conduct is a natural result of your origin.'

But Kroll is mistaken. Rebecca had no idea at all that she could be Dr West's daughter. When Kroll began with dark hints at her past, she must have thought he was referring to something else. After she has gathered what he means, she can still retain her composure for a while, for she is able to suppose that her enemy is basing his calculations on her age, which she had given falsely on an earlier visit of his. But Kroll demolishes this objection by saying: 'Well, so be it, but my calculation may be right, nonetheless; for Dr West was up there on a short visit the year before he got the appointment.' After this new information, she loses her self-possession. 'It is not true!' She walks about wringing her
[328] hands. 'It is impossible. You want to cheat me into believing it. This can never, never be true. It cannot be true. Never in this world! –' Her

agitation is so extreme that Kroll cannot attribute it to his information alone.

'KROLL: But, my dear Miss West – why in Heaven's name are you so terribly excited? You quite frighten me. What am I to think – to believe –?

'REBECCA: Nothing. You are to think and believe nothing.

'KROLL: Then you must really tell me how you can take this affair – this possibility – so terribly to heart.

'REBECCA (*controlling herself*): It is perfectly simple, Rector Kroll. I have no wish to be taken for an illegitimate child.'

The enigma of Rebecca's behaviour is susceptible to only one solution. The news that Dr West was her father is the heaviest blow that can befall her, for she was not only his adopted daughter, but had been his mistress. When Kroll began to speak, she thought that he was hinting at these relations, the truth of which she would probably have admitted and justified by her emancipated ideas. But this was far from the Rector's intention; he knew nothing of the love affair with Dr West, just as she knew nothing of Dr West's being her father. She *cannot* have had anything else in her mind but this love affair when she accounted for her final rejection of Rosmer on the ground that she had a past which made her unworthy to be his wife. And probably, if Rosmer had consented to hear of that past, she would have confessed half her secret only and have kept silence on the more serious part of it.

But now we understand, of course, that this past must seem to her the more serious obstacle to their union – the more serious crime.

After she has learnt that she has been the mistress of her own father, she surrenders herself wholly to her now overmastering sense of guilt. She makes the confession to Rosmer and Kroll which stamps her as a murderess; she rejects for ever the happiness to which she has paved the way by crime, and prepares for departure. But the true motive of her sense of guilt, which results in her being wrecked by success, remains a secret. As we have seen, it is something quite other than the atmosphere of Rosmersholm and the refining influence of Rosmer.

At this point no-one who has followed us will fail to bring forward an objection which may justify some doubts. Rebecca's first refusal of Rosmer occurs before Kroll's second visit, and therefore before his exposure of her illegitimate origin and at a time when she as yet knows nothing of her incest – if we have rightly understood the dramatist. Yet this first refusal is energetic and seriously meant. The sense of guilt which bids her [329]

renounce the fruit of her actions is thus effective before she knows anything of her cardinal crime; and if we grant so much, we ought perhaps entirely to set aside her incest as a source of that sense of guilt.

So far we have treated Rebecca West as if she were a living person and not a creation of Ibsen's imagination, which is always directed by the most critical intelligence. We may therefore attempt to maintain the same position in dealing with the objection that has been raised. The objection is valid: before the knowledge of her incest, conscience was already in part awakened in Rebecca; and there is nothing to prevent our making the influence which is acknowledged and blamed by Rebecca herself responsible for this change. But this does not exempt us from recognizing the second motive. Rebecca's behaviour when she hears what Kroll has to tell her, the confession which is her immediate reaction, leave no doubt that then only does the stronger and decisive motive for renunciation begin to take effect. It is in fact a case of multiple motivation, in which a deeper motive comes into view behind the more superficial one. Laws of poetic economy necessitate this way of presenting the situation, for this deeper motive could not be explicitly enunciated. It had to remain concealed, kept from the easy perception of the spectator or the reader; otherwise serious resistances, based on the most distressing emotions, would have arisen, which might have imperilled the effect of the drama.

We have, however, a right to demand that the explicit motive shall not be without an internal connection with the concealed one, but shall appear as a mitigation of, and a derivation from, the latter. And if we may rely on the fact that the dramatist's conscious creative combination arose logically from unconscious premises, we may now make an attempt to show that he has fulfilled this demand. Rebecca's feeling of guilt has its source in the reproach of incest, even before Kroll, with analytical perspicacity, has made her conscious of it. If we reconstruct her past, expanding and filling in the author's hints, we may feel sure that she cannot have been without some inkling of the intimate relation between her [330] mother and Dr West. It must have made a great impression on her when she became her mother's successor with this man. She stood under the domination of the Oedipus complex, even though she did not know that this universal phantasy had in her case become a reality. When she came to Rosmersholm, the inner force of this first experience drove her into bringing about, by vigorous action, the same situation which had been realized in the original instance through no doing of hers – into getting rid of the wife and mother, so that she might take her place with the

husband and father. She describes with a convincing insistence how, against her will, she was obliged to proceed, step by step, to the removal of Beata.

'You think then that I was cool and calculating and self-possessed all the time! I was not the same woman then that I am now, as I stand here telling it all. Besides, there are two sorts of will in us, I believe! I wanted Beata away, by one means or another; but I never really believed that it would come to pass. As I felt my way forward, at each step I ventured, I seemed to hear something within me cry out: No farther! Not a step farther! And yet I *could* not stop. I *had* to venture the least little bit farther. And only one hair's-breadth more. And then one more – and always one more. And then it happened. – That is the way such things come about.'

That is not an embellishment, but an authentic description. Everything that happened to her at Rosmersholm, her falling in love with Rosmer and her hostility to his wife, was from the first a consequence of the Oedipus complex – an inevitable replica of her relations with her mother and Dr West.

And so the sense of guilt which first causes her to reject Rosmer's proposal is at bottom no different from the greater one which drives her to her confession after Kroll has opened her eyes. But just as under the influence of Dr West she had become a freethinker and despiser of religious morality, so she is transformed by her love for Rosmer into a being of conscience and nobility. This much of the mental processes within her she herself understands, and so she is justified in describing Rosmer's influence as the motive for her change – the motive that had become accessible to her.

The practising psychoanalytic physician knows how frequently, or how invariably, a girl who enters a household as servant, companion or [331]
governess will consciously or unconsciously weave a daydream, which derives from the Oedipus complex, of the mistress of the house disappearing and the master taking the newcomer as his wife in her place.[1] *Rosmersholm* is the greatest work of art of the class that treats of this common phantasy in girls. What makes it into a tragic drama is the extra circumstance that the heroine's daydream had been preceded in her childhood by a precisely corresponding reality.[2]

1 [Cf. the case of Miss Lucy R. in the *Studies on Hysteria* (1895*d*), *RSE*, **2**, 103 ff.]

2 The presence of the theme of incest in *Rosmersholm* has already been demonstrated by the same arguments as mine in Otto Rank's extremely comprehensive *Das Inzest-Motiv in Dichtung und Sage* (1912*c*, [404–5]).

After this long digression into literature, let us return to clinical experience – but only to establish in a few words the complete agreement between them. Psychoanalytic work teaches that the forces of conscience which induce illness in consequence of success, instead of, as normally, in consequence of frustration, are closely connected with the Oedipus complex, the relation to father and mother – as perhaps, indeed, is our sense of guilt in general.[1]

1 [Some twenty years later, in his Open Letter to Romain Rolland describing his first visit to the Acropolis at Athens (1936*a*), *RSE*, **22**, Freud compared the feeling of something being 'too good to be true' with the situation analysed in the present paper.]

III
CRIMINALS FROM A SENSE OF GUILT

In telling me about their early youth, particularly before puberty, people [332]
who have afterwards often become very respectable have informed me of forbidden actions which they committed at that time – such as thefts, frauds and even arson. I was in the habit of dismissing these statements with the comment that we are familiar with the weakness of moral inhibitions [*Hemmungen*][T] at that period of life, and I made no attempt to find a place for them in any more significant context. But eventually I was led to make a more thorough study of such incidents by some glaring and more accessible cases in which the misdeeds were committed while the patients were actually under my treatment, and were no longer so youthful. Analytic work then brought the surprising discovery that such deeds were done principally because they were forbidden, and because their execution was accompanied by mental [*seelische*] relief for their doer. He was suffering from an oppressive feeling of guilt, of which he did not know the origin, and after he had committed a misdeed this oppression was mitigated. His sense of guilt was at least attached to something.

Paradoxical as it may sound, I must maintain that the sense of guilt was present before the misdeed, that it did not arise from it, but conversely – the misdeed arose from the sense of guilt. These people might justly be described as criminals from a sense of guilt. The pre-existence of the guilty feeling had of course been demonstrated by a whole set of other manifestations and effects.

But scientific work is not satisfied with the establishment of a curious fact. There are two further questions to answer: what is the origin of this obscure sense of guilt before the deed, and is it probable that this kind of causation plays any considerable part in human crime?

An examination of the first question held out the promise of bringing us information about the source of mankind's sense of guilt in general. The invariable outcome of analytic work was to show that this obscure sense of guilt derived from the Oedipus complex and was a reaction to [333]
the two great criminal intentions of killing the father and having sexual relations with the mother. In comparison with these two, the crimes committed in order to fix the sense of guilt to something came as a relief to the sufferers. We must remember in this connection that parricide and incest with the mother are the two great human crimes, the only ones

which, as such, are pursued and abhorred in primitive communities. And we must remember, too, how close other investigations have brought us to the hypothesis that the conscience of mankind, which now appears as an inherited mental force [*Seelenmacht*][T], was acquired in connection with the Oedipus complex.

Macht

In order to answer the second question we must go beyond the scope of psychoanalytic work. With children it is easy to observe that they are often 'naughty' on purpose to provoke punishment, and are quiet and contented after they have been punished. Later analytic investigation can often put us on the track of the guilty feeling which induced them to seek punishment. Among adult criminals we must no doubt except those who commit crimes without any sense of guilt, who have either developed no moral inhibitions or who, in their conflict with society, consider themselves justified in their action. But as regards the majority of other criminals, those for whom punitive measures are really designed, such a motivation for crime might very well be taken into consideration; it might throw light on some obscure points in the psychology of the criminal, and furnish punishment with a new psychological basis.

A friend has since called my attention to the fact that the 'criminal from a sense of guilt' was known to Nietzsche too. The pre-existence of the feeling of guilt, and the utilization of a deed in order to rationalize this feeling, glimmer before us in Zarathustra's sayings[I] 'On the Pale Criminal'. Let us leave it to future research to decide how many criminals are to be reckoned among these 'pale' ones.

1 [In the editions before 1924, 'obscure sayings'. – A hint at the idea of the sense of guilt being a motive for misdeeds is already to be found in the case history of 'Little Hans' (1909*b*), *RSE*, **10**, 33, as well as in that of the 'Wolf Man' (1918*b*), ibid., **17**, 25, which, though published later than the present paper, was, in fact, mostly written in the year before it. In this latter passage the complicating factor of masochism is introduced.]

Shorter Writings

(1915–17)

A MYTHOLOGICAL PARALLEL TO A VISUAL OBSESSION[1]

(1916–17)

In a patient of about twenty-one years of age the products of unconscious mental activity [*Geistesarbeit*][T] became conscious not only in obsessive thoughts [*Zwangsgedanken*] but also in obsessive images [*Zwangsbilder*][T]. The two could accompany each other or appear independently. At one particular time, whenever he saw his father entering the room, there came into his mind in close connection an obsessive word and an obsessive image. The word was '*Vaterarsch*' ['father-arse']; the accompanying image represented his father as the naked lower part of a body, provided with arms and legs, but without the head or upper part. The genitals were not indicated, and the facial features were painted on the abdomen. [337] *Geist* *Zwang*

It will help to explain this more than usually absurd symptom if I mention that the patient, who was a man of fully developed intellect and high moral ideals, manifested a very lively anal erotism in the most various ways until after his tenth year. After this had been got over, his sexual life was once again forced back to the preliminary anal stage by his later struggle against genital erotism. He loved and respected his father greatly, and also feared him not a little; judged by his own high standards in regard to asceticism and the suppression of the drives [*Triebunterdrückung*][T], however, his father seemed to him a person who stood for debauchery and the pursuit of enjoyment in material things. *Trieb*

'Father-arse' was soon explained as a jocular Teutonizing of the honorific title of 'patriarch'.[2] The obsessive image is an obvious caricature. It recalls other representations [*Darstellungen*] which, with a derogatory end in view, replace a whole person with one of his organs, e.g. his genitals; it reminds us, too, of unconscious phantasies [338]

1 ['Mythologische Parallele zu einer plastischen Zwangsvorstellung', *Int. Z. ärztl. Psychoan.*, **4** (2) (1916), 110; *SKSN*, **4** (1918), 195 (1922, 2nd ed.); *GS*, **10** (1924), 240; *GW*, **10** (1946), 398; *SA*, **7** (1973), 121. English translation: *CP*, **4** (1925), 345 (Tr. C. J. M. Hubback); *SE*, **14** (1957), 337 (Tr. J. Strachey, based on Hubback). The present translation is a lightly revised reprint of the *SE* version.]

2 [The two words sound more alike in German than in English. 'Patriarch' is spelt the same in both languages, but pronounced differently.]

[*Phantasien*][T] which lead to the identification of the genitals with the whole person, and also of joking figures of speech, such as 'I am all ears'.

The placing of the facial features on the abdomen of the caricature struck me at first as very strange. But I soon remembered having seen the same thing in French caricatures.[1] Chance then brought to my notice an antique representation, which tallied exactly with my patient's obsessive image.

According to the Greek legend, Demeter came to Eleusis in search of her daughter after she had been abducted, and was given lodging by Dysaules and his wife Baubo; but in her great sorrow she refused to touch food or drink. Thereupon her hostess Baubo made her laugh by suddenly lifting up her dress and exposing her body. A discussion of this anecdote, which was probably intended to explain a magic ceremonial which was no longer understood, is to be found in the fourth volume of Salomon Reinach's work, *Cultes, mythes et religions*, 1912, [115]. In the same passage the author mentions that during the excavations at Priene in Asia Minor some terracottas were found which represented Baubo. They show the body of a woman without a head or chest and with a face drawn on the abdomen: the lifted dress frames this face like a crown of hair (ibid., 117).

1 Cf. 'L'impudique Albion', a caricature of England drawn in 1901 by Jean Véber, reproduced in Fuchs, 1908, [384].

A CONNECTION BETWEEN A SYMBOL AND A SYMPTOM[1]

(1916–17)

Experience in the analysis of dreams has sufficiently well established the [339]
hat as a symbol of the genital organ, most frequently of the male organ.[2] It cannot be said, however, that the symbol is an intelligible one. In phantasies [*Phantasien*][T] and in numerous symptoms the head too appears as a symbol of the male genitals, or, if one prefers to put it so, as something standing for them. It will sometimes have been noticed that patients suffering from obsessions express an amount of abhorrence of and indignation against punishment by beheading far greater than they do in the case of any other form of death; and in such cases the analyst may be led to explain to them that they are treating being beheaded as a substitute for being castrated. Instances have often been analysed and published of dreams dreamt by young people or reported as having occurred in youth, which concerned the subject of castration, and in which a round ball was mentioned which could only be interpreted as the head of the dreamer's father. I was recently able to solve a ceremonial performed by a woman patient before going to sleep, in which she had to lay her small top pillow diamond-wise on the other ones and to rest her head exactly in the long diameter of the diamond-shape. The diamond had the meaning that is familiar to us from drawings on walls [graffiti]; the head was supposed to represent a male organ.[3]

It may be that the symbolic meaning of the hat is derived from that of
the head, insofar as a hat can be regarded as a prolonged, though detach- [340]
able head. In this connection I am reminded of a symptom by means of which obsessional neurotics succeed in causing themselves continual

1 ['Eine Beziehung zwischen einem Symbol und einem Symptom', *Int. Z. ärztl. Psychoan.*, **4** (2) (1916), 111; *SKSN*, **4** (1918), 198 (1922, 2nd ed.); *GS*, **5** (1924), 310; *Psychoanalyse der Neurosen* (1926), 38; *Neurosenlehre und Technik* (1931), 21; *GW*, **10** (1946), 394. English translation: *CP*, **2** (1924), 162 (Tr. D. Bryan); *SE*, **14** (1957), 339 (Tr. J. Strachey, based on Bryan). The present translation is a lightly revised reprint of the *SE* version.]

2 [A hat dream is recorded in Chapter VI (E) of *The Interpretation of Dreams* (1900*a*), *RSE*, **5**, 322–3.]

3 [This case is related in detail in Lecture XVII of Freud's *Introductory Lectures* (1916–17*a*), ibid., **16**, 234.]

torments. When they are in the street they are constantly on the look-out to see whether some acquaintance will greet them first by taking off his hat, or whether he seems to be waiting for *their* salutation; and they give up a number of their acquaintances after discovering that they no longer greet them or do not return their own salutation properly. There is no end to their difficulties in this connection; they find them everywhere as their mood and fancy dictate. It makes no difference to their behaviour when we tell them, what they all know already, that a salutation by taking off the hat has the meaning of an abasement before the person saluted – that a Spanish grandee, for example, enjoyed the privilege of remaining covered in the king's presence – and that their own sensitiveness on the subject of greeting therefore means that they are unwilling to show themselves less important than the other person thinks he is. The resistance of their sensitiveness to explanations such as this suggests that a motive less familiar to consciousness is at work; and the source of this excess of feeling might easily be found in its relation to the castration complex.

LETTER TO DR HERMINE VON HUG-HELLMUTH[1]

(1919 [1915])

The diary is a little gem. I really believe it has never before been possible [341]
to obtain such a clear and truthful view of the mental impulses that characterize the development of a girl in our social and cultural stratum during the years before puberty. We are shown how her feelings grow up out of a childish egoism till they reach social maturity; we learn what form is first assumed by her relations with her parents and with her brothers and sisters and how they gradually gain in seriousness and inward feeling; how friendships are made and broken; how her affection feels its way towards her first objects; and, above all, how the secret of sexual life begins to dawn on her indistinctly and then takes complete possession of the child's mind; how, in the consciousness of her secret knowledge, she at first suffers hurt, but little by little overcomes it. All of this is so charmingly, so naturally, and so gravely expressed in these artless notes that they cannot fail to arouse the greatest interest in educators and psychologists.

[. . .] It is your duty, I think, to publish the diary. My readers will be grateful to you for it.

1 ['Brief an Frau Dr Hermine von Hug-Hellmuth.' The letter, two extracts from which follow, was written by Freud on April 27, 1915. These extracts were included in von Hug-Hellmuth's preface to her edition of the diary to which the letter refers: *Tagebuch eines halbwüchsigen Mädchens*, published by the Internationaler Psychoanalytischer Verlag (Leipzig, Vienna and Zürich, 1919; 2nd ed., 1921; 3rd ed., 1922). The extracts were reprinted in *GS*, **11** (1928), 261, and *GW*, **10** (1946), 456. An English translation of the diary (including the preface), by Eden & Cedar Paul, was published in London by George Allen & Unwin and in New York by Seltzer (1921; 2nd ed., 1936) under the title *A Young Girl's Diary*. It should be added that after its publication suggestions were made that the diary might have been touched up by the unidentified person who confided the manuscript to von Hug-Hellmuth. The German edition was therefore withdrawn from circulation, though the English translation remained in print. The present version is by James Strachey, reprinted from *SE*, **14** (1957), 341. It appears by arrangement with Messrs George Allen & Unwin.]

BIBLIOGRAPHY

[Titles of books and periodicals are in italics; titles of papers are in inverted commas. Abbreviations are in accordance with the *World List of Scientific Periodicals* (London, 1963–5). Further abbreviations used in this volume can be found in the List at the end of this bibliography. Numerals in bold type refer to volumes; ordinary numerals refer to pages. In the case of the Freud entries, the letters attached to the dates of publication are in accordance with the corresponding entries in the complete bibliography of Freud's writings in the last volume of the *Revised Standard Edition*.

Vier Krankengeschichten = Freud, *Vier psychoanalytische Krankengeschichten*, Vienna, 1932

GENERAL INDEX

Abraham, *K.* (*see also* Bibliography), 5 *n.* 2, 15, 29, 31, 39–41, 53, 62, 64 *n.* 3, 93, 173, 213, 215, 217 *n.* 2, 223
Abstract thought, representation of, in dreams, 203 *n.* 1
Achilles, 293
Acropolis, the, 334 *n.* 1
Active and passive (*see also* Masculine and feminine), 48, 107, 111–18, 123
Actual neuroses, 72–3
Adler, *A.* (*see also* Bibliography), 3–4, 33 *n.* 2, 39, 41, 44–58, 62, 80, 86, 108, 128
  theories of, disputed, 4, 44–54, 56–7, 62, 80 and *n.* 1, 86, 107 *n.* 2, 128
Affect
  and motility, 158, 166, 200–2
  quality of, changed, 73–4, 135, 157–9
  quota of, 100, 135–9, 157–8
  release of, 7, 157–9, 161–2, 166, 200
  transformation of psychical energy into, 135
  unconscious, non-existence of, 157–8
After-education, 316
'After-pressure', 131, 159–60
Aggressiveness (*see also* Destructiveness), 51, 102, 120
Agnosia, 191
Alcoholic deliria, 208 *n.* 1, 227
Also sprach Zarathustra (by *Nietzsche*), 336
Ambiguity, verbal, 203
Ambivalence
  drive, 115–16, 139, 241, 281
  of feeling, 115 *n.* 2, 117, 122–3, 138, 224–5, 229–30, 292–5, 281, 298
  of melancholia, 229–30
  of sexual aims, 122, 222–3
  of the repressed, 229–30
  use of term, 115–16
Amentia, *Meynert's*, 204–6, 207–9
American Psychoanalytic Association, 40
Amnesia, 13, 44
Anaclitic (attachment) object choice, 76–8, 88, 111
'Anagogic' dream interpretation, 54, 203 *n.* 1
Anal erotism, 122, 225, 339
Analogies
  aboriginal population, 172
  American flirtation, 289
  amoeba and pseudopodia, 65
  Chinese faces, 45
  circus clown, 47
  eggs and hens, 50
  entailed property, 68
  eruption of lava, 115
  flirtation and marriage, 12
  game of chess, 290
  illustrations for a newspaper article, 203 *n.* 1
  individuals of mixed race, 168
  kinship of mankind and legal kinship, 68
  Lichtenberg knife, 58
  open wound, 226
  parvenu, 54
  springboard, 48
  symphony of life, 55
  undesirable guest, 135
  village becoming a town, 284
'Analytical Psychology' (*Jung*), 4
Andreas-Salomé, *L.*, 94, 307 *n.* 1

Animal phobias, 137, 161–2
Animals
  consciousness in, 150, 167
  cruelty to, 281
  instinct in, 172
  narcissism of, 77
Animism, 150, 152
Anna O., *Fräulein*, case of (*see* Case of *Fräulein Anna O.*)
Anne, *Queen* (wife of *Richard III*), 326 *n.* 2
Anthropology and psychoanalysis, 32, 55
Anticathexis, 133–4, 159–64, 168–9, 200, 226, 227–8, 230, 239, 241
Anti-Semitism, 34 *n.* 2, 38
Anxiety, moral, 139
Anxiety, neurotic (*see also* Fear; Phobias)
  and affect, 135–6, 139, 157–9, 161–2
  and castration complex, 80
  and hypochondria, 72–3, 75
  and sexual abstinence, 11–12
  transformation of repressed mental energy into, 135–6, 137–9, 157–9, 161–3, 248
  'unconscious', 157
Anxiety, social, 89, 139, 279
Anxiety hysteria (*see also* Transference neuroses), 137–8, 161–4, 173, 239–43, 246–8
Anxiety neurosis, 72–3, 101 *n.* 2
Anzengruber, *L.*, 296
Aphasia, 144–5, 149 *n.* 1, 155 *n.* 1, 177 *n.* 1, 183, 186–9, 190–1
Archaic inheritance, 115
Aristotle, 208
Arousal dreams, 268
Art, creative, 31, 276–7, 307–9
Asceticism, 70, 339
'Asra, Der' (by *H. Heine*), 289
Association of ideas (*see also* Free association), 131, 161, 183, 187–91
Asymbolia, 190–1
Atkinson, *J. J.* (*see also* Bibliography), 251, 291
Attention, 169, 189, 196
Australasian Medical Congress of 1911, 26
Australian aborigines, 294
Auto-erotism, 14, 55–6, 61, 66, 75–6, 114–15, 116, 118–19, 176, 247, 251
Avoidances, 137, 139, 162–3

Baden-Baden, Medical Congress at, 23 *n.* 1
Balder, 318
Balduin Bählamm (by *W. Busch*), 71
Balint, *M.*, 235
Balzac, *H. de*, 297
Banquo
  in *Holinshed*, 325
  in *Macbeth*, 324–5
Baubo, 340
Beheading as symbol for castration, 341
'*Belle indifférence*' of hysterics, 137–8

Binswanger, *L.*, 29, 94 *n.* 1
Biographical dreams, 57
Biology and psychology, 44, 48–9, 67–9, 105–7, 110, 118, 123, 275–6
Bjerre, *P.*, 28
Blackhead as symbol, 176–7
Bleuler, *E.* (*see also* Bibliography), 5 *n.* 2, 22, 24, 29, 35–6, 38–9, 64, 115, 154 *n.* 1, 173, 175
B'nai B'rith, 273
Bonaparte, *Napoleon I*, 37 *n.* 1
Bonaparte, *Princess Marie*, 102 *n.* 2
'Bound' and 'free' psychical energy (*see also* Primary process; Secondary process), 166, 227–8, 230
Boys
  castration complex in, 80
  reaction to witnessing sexual act in, 48
Brain, anatomy of, 11, 154–5, 183
Braut von Messina, *Die* (by *F. Schiller*), 323 *n.* 1
Brentano, *C. von*, 305
Breuer, *J.* (*see also* Bibliography), 5–11, 14, 145 *n.* 1, 153, 165 *n.* 1, 166, 205 *n.* 1
  breach with *Freud*, 8–10, 16
  collaboration with *Freud*, 5–8, 101, 135 *n.* 2, 144
Brill, *A. A.* (*see also* Bibliography), 26–7, 40

Brouardel, *P. C. H.*, 11
Brunswick, *R. Mack* (*see also* Bibliography), 175 *n.* 3
Buenos Aires, International Congress of 1910 at, 26
Bülow, *H. von*, 305
Burghölzli Hospital, 22–3, 39
Busch, *W.*, 71
Bushmen, 294
Butler, *S.* (*see also* Bibliography), 181–2

Cannibalistic phase (*see also* Oral erotism), 214–15, 223
Case
  of '*Dora*', 8, 18–19, 47 *n.* 1
  of '*Katharina*', 261 *n.* 1
  of '*Little Hans*', 107 *n.* 2, 108 *n.* 1, 156 *n.* 1, 336 *n.* 1
  of *Frau Emmy von N.*, 25 *n.* 2, 145
  of *Fräulein Anna O.*, 9, 14
  of *Fräulein Elisabeth von R.*, 219 *n.* 1
  of *Miss Lucy R.*, 333 *n.* 1
  of '*Rat Man*', 128, 139 *n.* 1, 261 *n.* 1
  of *Senatspräsident Schreber*, 62, 63 *n.* 1, 64 *nn.* 1 & 3, 69, 72 *n.* 1, 76 *n.* 1, 93, 94 *n.* 3, 100, 102, 131 *nn.* 2 & 3, 179 *n.* 2, 259, 263 *n.* 1
  of '*Wolf Man*', 4, 49 *n.* 2, 113 *n.* 3, 115 *n.* 2, 137, 172 *n.* 1, 175 *n.* 3, 215, 245 *n.* 2, 266 *n.* 2, 269 *n.* 1, 336 *n.* 1
Case, unnamed
  of girl with delusions of being watched, 259, 261–5
  of obsessions about blackheads, 175–6
  of obsessions about dressing (*Tausk's* case and *Reitler's* case), 176
  of organ speech in schizophrenic girl (*Tausk's* case), 174–5
Castration
  complex, 80, 176, 342
  phantasies, 266
  symbolized by beheading, 341
  threat of, 49, 176, 251, 253
Cathartic therapy, 6–7, 12, 128, 145
Cathectic energy (*see also* Psychical energy), 134, 166, 169 *n.* 3, 226, 227–8, 230
Cathexis, use of term, 208 *n.* 2
'Censor', 85, 87
Censorship, 83–4, 85 *n.* 1, 153, 155, 166–7, 169–71, 199–202, 207, 221, 243, 268
  between the *Pcs.* and *Cs.*, 153, 169, 170–1, 202
  between the *Ucs.* and *Pcs.*, 153, 164, 169, 170–1, 199–201
  of news in wartime, 279
  use of term, 85 *n.* 1
Ceremonials, neurotic, 32, 341
Character formation, 215, 281–2, 283, 317
Charcot, *J.-M.*, 7, 10–11, 14, 18, 138
Chemical factors in drive processes, 68, 101, 108, 110, 144–5, 149
Childhood
  impressions of, 8, 14, 17, 56
  neuroses of, 49
  traumas of, 15, 317
Children (*see also* Infantile sexuality)
  and punishment, 336
  animal phobias of, 137, 161–2
  attitude to death of, 289
  learning muscular control in, 114
  learning to speak in, 187
  narcissism of, 63–5, 76–9, 80–2, 87, 118 *n.* 2, 120, 197–8, 223
  naughtiness in, 281, 336
  object choice in, 75–6, 78
  psychoanalysis of, 15, 57
  relation between parents and, 79, 118 *n.* 2, 214, 325, 343
  sexual researches of, 48–9, 343
Chrobak, *R.*, 10–12
Civilization, 32, 50, 52, 55
  and war, 276–84, 294, 298–9, 300–1, 309
  hypocrisy of, 283–4
  pressure of, 50, 281–4
Civilized man's attitude to death, 288–9, 298–9
Clark University, Worcester, Mass., 5 *n.* 3, 26
Classical antiquity, 277–8, 296
Clitoris, 268
Clock as symbol, 267
Columbus, 37

Complete Neuroscientific Works of Sigmund Freud, 7 *n.* 1, 11 *n.* 1, 18 *n.* 3, 105 *n.* 1, 144, 149 *n.* 1, 151 *n.* 1, 155 *n.* 1, 177 *n.* 1, 183, 186
Complex, use of term (*see also* Castration complex; Family complex; Oedipus complex), 25
Component drives, 32, 111, 116–17, 120–1, 269, 316
Compulsion to repeat, 269 *n.* 1
Condemnation and repression, 129
Condensation
  distinguishing mark of the primary process, 165, 166, 175
  in dreams, 175, 202–3
  in hysterical conversion, 138
  verbal, in schizophrenia, 175
Conflict
  due to ambivalence, 224–5, 229–30, 292–3, 298–9
  underlying dream distortion, 16
  underlying repression, 81, 134
  underlying the neuroses, 7, 55–6, 101–2, 109, 128, 259, 265, 269, 298, 317, 320–1
'Confluence of drives' (*Adler*), 108
Conscience (*see also* Guilt, sense of), 32, 83–5, 221, 265, 268, 294–5, 322, 327, 329, 332–4, 336
  defined as 'social anxiety', 279
  fear of (moral anxiety), 139
Conscientiousness, 138
Consciousness
  accessibility to, 131–3, 134, 168–9, 178–9
  and affectivity, 156–9
  and animism, 150–2
  and self-consciousness, 85 *n.* 2
  assumption of, in other people, 150–2
  drive never an object of, 100, 110, 156
  exclusion from, in repression, 81, 128–39, 147, 153, 156–64, 169–70, 179, 219, 229
  gaps in, 144, 147–8
  relation to perception, 196, 203–4, 206–8
  relation to the preconscious, 153, 167–72, 177–80, 199–203, 206, 229–30
  relation to the unconscious, 130–1, 136, 145–50, 152–6, 158–72, 177–80, 339
  topographically considered, 154–6, 159–60, 209
  use of term, 146 *n.* 1, 152–3
Constancy, principle of, 73–5, 105–7
Conversion, use of term, 6 *n.* 1
Conversion hysteria, 6–7, 75, 94, 137–8, 163–4, 173, 176, 239, 240–3, 246–7, 249
Crime, 77, 313, 335–6
'Critical agency' (*see also* Ego ideal, the), 83–5, 214, 221, 222, 229–30
Cs. (*see* Consciousness)
Culture, susceptibility to, 280–5

Darmesteter, J. (*see also* Bibliography), 326 *n.* 1, 327 *n.* 2
Darwin, C., 37, 291
Day's residues, 199–203
De l'amour (by *Stendhal*), 289 *n.* 2
Death
  attitude of children to, 289
  attitude of civilized man to, 288–9, 298–9
  attitude of primaeval man to, 291–8
  attitude to, in wartime, 275, 290
  denial of, 288–9, 292–6, 298
  fear of, 225, 290, 296
  of loved persons (*see* Mourning)
Death drive (*see also* Ego drives), 102, 106 *n.* 1, 123 *n.* 2
Death wish, 214, 295–8, 335
Defence (*see also* Repression), 111, 116, 130, 163, 198, 239 *nn.* 4 & 5, 241, 243
  use of term, 8–9, 128
Deferred action (see *Nachträglichkeit*)
Defoe, D., 18
Delgado, H., 29 *n.* 1
Deliria, 204, 208 *n.* 1
  alcoholic, 208 *n.* 1, 227
Delusions
  of being watched, 83–4, 261–7
  of inferiority, 219–20
  of persecution, 214, 261–6, 268
  wish fulfilment in, 201
Dementia praecox, 24–5, 64, 70–1, 75, 173, 179, 200, 208, 246–7, 251, 253
Demeter, 340

Demons and spirits of 'primitive' man, 292–5
Depression, states of (*see* Melancholia)
Depth psychology, 36, 146, 154
Derivatives of the unconscious, 131–3, 134, 167–9, 170–2

Deuticke, *F.*, 41
Devil, the, 37 *n.* 1
Diamond as symbol, 341
Displacement
in dreams, 175, 202–3
in formation of substitutive ideas, 128, 137, 139, 161, 163, 165, 166
of meaning of words in schizophrenia, 175
of recollections in paranoia, 267
on to something small or indifferent, 139
Disposition, 244–54
Distortion
in dreams, 16, 84–5
in symptom-formation, 132–3, 170
of repressed material, 132–4
'*Dora*', case of (*see* Case of '*Dora*')
'*Double conscience*' (*see also* Splitting of the mind), 151
Doubt, absence of, in the unconscious, 164
Draco, 296
Dream content, manifest, 46, 57, 84–5, 175, 202–4
Dream interpretation, 8, 12, 16–17, 23–4, 28 *n.* 4, 31, 50, 57, 202–3, 285, 341
'anagogic', 54, 203 *n.* 1
Dream thoughts, latent, 84–5, 175, 199, 200–1, 204
confused with dreams, 50, 57
Dreams
a form of thinking, 57
and myths, 31
and phantasies, 168
and schizophrenia compared, 175, 203–6
and sleep, 134, 198–201, 208, 285
arousal, 268
biographical, 57
castration, 341
condensation in, 175, 202–3
current perceptual material and, 86, 198
diagnostic capacity of, 198
displacement in, 175, 202–3
distortion in, 16, 84–5
during analysis, 57, 203 *n.* 1
egoism of, 72, 198, 285
evidence of unconscious mental processes, 147–8, 149, 166, 172
'functional phenomenon' in, 84
hallucinatory character of, 195, 198, 202–4
in literature, 31
metapsychology of, 195–209
'prospective purpose' of (*Adler*), 50
regressive character of, 54, 197–8, 202–5, 208, 285
representation of abstract thought in, 203 *n.* 1
Silberer's theory of, 84
speeches in, 203, 205
symbolism of, 16, 31
wish fulfilment in, 50, 197–8, 201–7
Dream-work, 57, 157, 175 *n.* 2, 203–4, 205, 277 *n.* 1
Drive
impulses, first use of term, 101
representatives, 99–107, 131–9, 156–7, 163–4, 205
stimuli (*see* Stimuli)

and the ego ideal, 81–5, 88–9
as stage in sexual development, 61–2, 66–7, 74, 75–80, 87, 116–22
basis of 'masculine protest', 80
concept of, 61–2, 63, 64–5, 102, 214
of animals, 77
of normal persons, 63–5, 85–6
of parents, 79
of state of sleep, 197–201, 208
of women, 77–8
primary, of children, 63–5, 76–9, 80–2, 87, 118 *n.* 2, 120, 197–8, 223
secondary, 65, 78
withdrawal of libido from external world in, 64–5, 73–5, 86–7, 230
use of term, 63 *n.* 1
Narcissistic
identification, 223–5, 247
object choice, 76–9, 85–6, 88, 222–5, 263, 267
psychoneuroses, 109, 172–3, 179, 199, 207, 217, 223, 236, 252
Natural beauty, transience of, 307–9
Negation
absence of, in the unconscious, 164–5, 296
and repression, 164
Nelken, *J.* (*see also* Bibliography), 31 *n.* 1
Neologisms, 175 *n.* 2
Neurasthenia, 72–3, 268
Neurology, mental events described in terms of, 103–6, 144–5, 154–5, 183–6, 201 *n.* 2, 213
Neuron theory, 144–5, 201 *n.* 2
Neuronal inertia, principle of, 105 *n.* 1, 106 *n.* 1
Neurons, 144–5, 201 *n.* 2
Neuroses (*see also* Actual neuroses; Anxiety neurosis; Hysteria; Narcissistic psychoneuroses; Obsessional neurosis; Transference neuroses)
and myths compared, 31
and psychoses compared, 24, 158
conflict underlying, 7, 55–6, 101–2, 109, 128, 259, 265, 269, 298, 317, 320–1
death wish against parents and, 214
disposition to, 244–54
distribution of libido in, 72–7, 82–4, 88–9, 173, 209, 320–1
frustration and, 74–5, 173, 320–1
of childhood, 49
organic disease or defect and, 49, 72–3, 86, 317–18
precipitating cause of, 7–8, 173, 228–9, 320–1, 327–9, 334
regressive character of, 7–8, 54, 197
repression and, 88, 128, 131–3, 136–9, 145, 157, 162–4
sexual aetiology of, 9–11, 14–15, 17–18, 24–6, 34, 44–5, 49, 55–6, 57–8, 110, 283
sublimation and, 82
traumatic aetiology of, 6, 7–8, 14–15, 229, 317
unconscious mental processes revealed in, 166
Neurotics
incapacity for love in, 71, 74, 88, 218–20
psychoanalysis of, 13, 16, 30–1, 63, 67, 88, 109–10, 315
New York Psychoanalytic Society, 40
Nietzsche, 12–13, 336
Nirvana principle, 106 *n.* 1
Nitszchke, *B.* (*see also* Bibliography), 273
Normal mental processes, 30–1, 70, 81, 83, 85–6, 147–9, 158, 168–9, 214, 217, 220, 222, 297–8, 300

Nuremberg, International Psychoanalytical Congress of 1910 at, 37, 38–41, 47 *n*. 2
Nutritional drive, 75–6, 78

Object choice
  anaclitic (attachment), 76–8, 88, 111
  in children, 75–6, 78
  incestuous, 54, 268
  narcissistic, 76–9, 85–6, 88, 222–5, 263, 267
  special types of, in men and women, 76–9
Object libido, 62, 64–7, 75–6, 81–2, 85–8, 102, 117–23, 215, 218, 221–3, 308, 321
  distribution of, in psychoses and neuroses, 64–5, 73–5, 88, 173, 177, 204, 228–30
  withdrawal of, in mourning, 228–30, 308
  withdrawal of, in sleep, 199
Object love (*see* Object choice; Object libido)
Object presentations, 177–80, 186, 190–1
Obsessional neurosis (*see also* Transference neuroses), 64, 67, 73, 75, 94, 109, 112, 128, 138–9, 164, 173–6, 224, 239, 240–4, 246–50, 341–2
Obsessional self-reproach, 230
Obsessions, 26, 148, 172, 214, 339–41
Odyssey, the, 293
Oedipus complex, 54–7, 214, 215, 332–4
Oeuvres complètes de Freud, 297 *n*. 2
Omnipotence, feelings of, 65, 85, 87
Ophuijsen, J. H. W. van, 28
Opposite, reversal of drive into, 111–23
Oral erotism, 122 *n*. 1, 213, 214–15, 223
'Organ inferiority' (*Adler*), 44, 49, 86
'Organ pleasure', 110, 116–17, 121
'Organ speech', 174–5
Organic defect or disease and neurosis, 49, 72–3, 86, 317–18
Original sin, 291–2
'Outside' and 'inside', distinction between (*see also* Reality; Stimuli), 105, 117–18, 119–20, 206–7
Overdetermination, use of term, 187 *n*. 3
Overvaluation, sexual, 76–8, 79, 82, 88

Pain, physical, 71, 113, 129–30, 218–19, 231
Parallelism, psychophysical, 149, 183–5
Paralysis, hysterical, 9, 11
Paranoia, 24, 66, 71, 75, 83–4, 89, 94, 199 *n*. 2, 214, 246–7, 251–2, 253, 259, 261–6, 267–8
  and homosexuality, 259, 263–7, 268
Paraphasia (*see also* Aphasia), 188
Paraphrenia, 64, 71, 73–5, 85, 89, 252
  use of term, 64 *n*. 1
Parapraxes, 148, 149, 300
Parental
  complex, 267

ÖFFENTLICHE VORLESUNGEN

AN DER

K. K. UNIVERSITÄT ZU WIEN

IM

WINTER-SEMESTER 1915/16.

Die Frist zur Immatrikulation und Inskription beginnt am 23. September 1915 und dauert bis einschließlich 9. Oktober 1915.

Nachträgliche Inskriptionen werden nur ganz ausnahmsweise bewilligt, wenn dafür die im § 32 der Studienordnung angeführten Gründe in unzweifelhafter Art nachgewiesen werden und die Vorlesungen nicht schon zu weit vorgerückt sind, um mit gehörigem Erfolge gehört zu werden. Als Endtermin für die Einbringung der Gesuche um nachträgliche Inskription gilt im Wintersemester der 10. Dezember.

(Bei dem Portier der k. k. Universität.)

Preis 10 Heller.

NOTE ON THE REVISED TRANSLATION

The translations in this *Revised Standard Edition* are supplemented by four sets of notes:

(1) Lengthy commentaries on the English renditions of technical terms that are considered controversial are provided in Volume 24. Usually at the first appearance of each such technical term in each text, but sometimes in other places where the issue seems relevant, the original German word is interpolated in square brackets and a superscript upper-case [T] indicates that the term is discussed in the 24th volume. There (on pp. 55–99) the commentaries appear, in alphabetical order, under the heading 'Notes on the Translation of Some Technical Terms'. If the technical term appears in a derivate form in the text, the root word (as it appears in Volume 24) is provided in the margin. For example, if the interpolated word is the derivative [*überträgt*], the root technical term *Übertragung* appears in the margin.

(2) Shorter commentaries on the English rendition of specific words or phrases appearing in particular places (as opposed to general technical terms) that have attracted comment in the secondary literature are also provided in Volume 24. These minor commentaries are distinguished from those concerning general technical terms by the use of a superscript lower-case [t] in the place where the controversial translation appears. The corresponding set of annotations appears on pp. 105–33 of Volume 24, in chronological order, under the heading 'Annotations to Individual Translations'.

(3) Further interpolations in the translations of German words in square brackets are provided *ad hoc*, without superscript letters, for reasons that should be self-explanatory in each instance. For example, if a technical term which was referenced and discussed in a Note in Volume 24 appears again shortly afterwards in a way that illuminates the points discussed there, then it is silently referenced again. Some of these interpolations might seem odd to German-speaking readers, since no attempt is made to 'adjust' Freud's grammar to conform with the English translation (see the Preface to the Revised Edition, *RSE*, **1**, xxvi *n*. 1). The words in square brackets interpolated in the text are always exactly what Freud wrote.

(4) In a good few places, commentaries (of both types 1 and 2) are also provided in the Editors' introductory notes, appendices and footnotes to the text itself. These are indexed in Volume 24, on pp. 601–6, under the heading 'Notes on Terms and Their Uses'. Such commentaries are usually reserved for matters of translation that are likely to be of interest or value to the general reader, as opposed to those with a special interest in such technical matters.

The pagination of the original *Standard Edition* is provided also in the margins, in square brackets, to assist cross-referencing.

For the reasons explained in the 'Preface to the Revised Edition' (*RSE*, **1**, xxix), all differences between the *SE* and *RSE* are identified through light underscoring of the text. This device was considered necessary to make readers aware of the subtle and pervasive revisions of the translations. The same applies to the revisions of the editorial apparatus. This underscoring will hopefully be removed in later editions of the *RSE*, once the revised edition has become established as the canonical one.

The overarching policy here has been to underscore all differences between the *SE* and *RSE*, with minimal exceptions, in order to ensure transparency. The three categories of exceptions (i.e. the differences that are *not* underscored) are (a) changes that are purely typographical and/or absolutely stereotyped across Volumes 1–23, (b) changes in the location of Freud texts within or between volumes, and (c) all the changes to Volume 24.

The rationale behind (a) is that we wanted to avoid any subjective judgements by the Editor of the *RSE* as to what is and what is not 'significant'. For example, some but not all readers might consider alterations to Strachey's spelling, grammar and punctuation to be trivial, but the potential significance – however subtle – varies with context. The rationale behind (b) is that these changes are indicated in the 'List of Relocated Freud Material in the Revised Edition', which is provided in Volume 24. These changes are also mentioned in the revised (and therefore underscored) editorial notes to the texts themselves. The rationale behind (c) is that the *RSE* version of Volume 24 is so utterly different from the *SE* version that readers can safely consider the volume as a whole to be new.

The following changes were deemed purely typographical and absolutely stereotyped, and are therefore exempted from underscoring:

(1) Changes in type-size, font and spacing (since they are objectively insignificant).

(2) The marginalia – including page numbers – and the superscript ^{T}s and ^{t}s (since they always represent changes).

(3) Changed page numbers in the cross-references and indexes (this follows logically from point 2).

(4) Altered footnote numbers (since new footnotes are always identified by the fact that the notes themselves are underscored, and the knock-on effects for numbering are objectively insignificant).

(5) Changes in running headings (since they repetitively echo changes that are underscored in the main body of text).

(6) Change from the singular possessive 'Editor's' to the plural 'Editors'' (since this applies throughout and follows logically from the fact that, unlike the *SE*, the *RSE* has two editors). In the few instances where the Editor is referred to in the singular, it is always clear from the context whether this means Strachey or Solms or, in the case of Freud (1985*a* [1915]), Grubrich-Simitis.

(7) This preliminary 'Note on the Revised Translation' (since it is obviously added; it applies only to the *RSE*).

(8) Captions to the illustrations (since they always represent changes).

(9) Changes in editorial style (since they are stereotyped and therefore need only be identified once, namely here):

- The word 'and' in two-author citations becomes '&', and a comma is inserted between author name/s and the publication date (e.g. Freud & Breuer, 1895*d*).
- Abbreviations of months (e.g. 'Oct.') and chapters ('Chap.') are spelt out ('October', 'Chapter').
- '*The*' is added to all editorial references to '*Interpretation of Dreams*'.
- Title abbreviations conform to modern usage (e.g. *G.W.* becomes *GW*).
- Punctuation is positioned inside closing quotation marks (e.g. 'The Latin word slipped your memory.').

(10) Modernized hyphenation of words is underscored, but not for those terms that occur very repetitively in the text (since they are stereotyped and the list is limited enough for readers to memorize). Here is the list, which implies also the plural and other grammatical forms of these terms:

anxiety-dream	*becomes*	anxiety dream
anxiety-hysteria	*becomes*	anxiety hysteria
day-dream	*becomes*	daydream
death-wish	*becomes*	death wish
dream-content	*becomes*	dream content
dream-interpretation	*becomes*	dream interpretation
dream-thought	*becomes*	dream thought
ego-cathexis	*becomes*	ego cathexis
ego-libido	*becomes*	ego libido
love-object	*becomes*	love object
object-cathexis	*becomes*	object cathexis
object-choice	*becomes*	object choice
object-libido	*becomes*	object libido
object-love	*becomes*	object love
object-presentation	*becomes*	object presentation
object-relation	*becomes*	object relation
psycho-analysis	*becomes*	psychoanalysis
sound-presentation	*becomes*	sound presentation
super-ego	*becomes*	superego
thing-presentation	*becomes*	thing presentation
to-day	*becomes*	today
wish-fulfilment	*becomes*	wish fulfilment
word-presentation	*becomes*	word presentation

Introductory Lectures on Psycho-Analysis
1922 London: Allen & Unwin. Pp. 395. (Tr. Joan Riviere; without Freud's Preface; with preface by Ernest Jones.)
1929 2nd ed. (revised). Same publishers. Pp. 395.

A General Introduction to Psychoanalysis
1935 New York: Liveright. Pp. 412. (The London ed. under the title of the old New York one. Tr. Joan Riviere; with prefaces by Ernest Jones and G. Stanley Hall. Freud's Preface included.)
Introductory Lectures on Psycho-Analysis
1961 & 1963 *SE*, **15** & **16**. Pp. vi + 496. (Tr. James Strachey, Freud's Prefaces included.)
1974 *PFL*, **1**. Pp. xxviii + 529. (Reprint of the *SE* translation.)

The present translation is a revised and corrected reprint of the *SE* version.

This book had a wider circulation than any of Freud's works, except, perhaps, *The Psychopathology of Everyday Life* (1901*b*), *RSE*, **6**.[1] It is also distinguished by the number of misprints in it. As is recorded above, 40 were corrected in the second edition; but there were many more, and a considerable number of slight variations in the text may be observed in the various editions. The present translation follows the text of the *Gesammelte Werke*, which is in fact identical to that of the *Gesammelte Schriften*; and only the more important deviations from earlier versions have been recorded.

The actual date of publication of the three parts is not clear. Part I was certainly out before the end of July, 1916, as is shown by a reference to it in a letter of Freud's
[5] to Lou Andreas-Salomé of July 27, 1916 (cf. Freud, 1960*a*). In the same letter he also speaks of Part II as being on the point of appearing. A letter of December 18, 1916, from Freud to Abraham suggests that in fact it only appeared at the end of the year (cf. Freud, 1965*a*). Part III seems to have been published in May, 1917.

The academic year of the University of Vienna fell into two parts: a winter term (or semester) running from October to March, and a summer one from April to July. The lectures printed here were delivered by Freud in two successive winter terms during the First World War: 1915–16 and 1916–17.[2] The fullest account of the circumstances leading to their publication can be found in the second volume of Ernest Jones's biography (1955, 245 ff.).

Although, as Freud himself remarked in his Preface to the *New Introductory Lectures* (1933*a*), *RSE*, **22**, his membership of the University of Vienna had been only 'a peripheral one', he had nevertheless, from the time of his appointment as Privatdozent (university lecturer) in 1885 and as Professor Extraordinarius (assistant professor) in 1902, given many courses of university lectures. These remained unrecorded, though some accounts of them may be found – for instance, by Hanns Sachs (1945, 39 ff.) and Theodor Reik (1942, 19 ff.), as well as by Ernest Jones (1953, 375 ff.). Freud decided that the series beginning in the autumn of 1915 should be the last, and

1 The *Lectures* were certainly the most translated of any. In Freud's lifetime (apart from English) they appeared in Dutch (1917), French (1922), Italian (1922), Russian (1922–3), Spanish (1923), Japanese (1928), Norwegian (1929), Hebrew (1930), Hungarian (1932), Serbo-Croatian (1933), Chinese (1933), Polish (1935) and Czech (1936). They had probably also appeared by then in Portuguese, Swedish, and later in Arabic.

2 The opening lecture of the series was delivered, according to Ernest Jones, on October 23, 1915, but according to a contemporary notice (*Int. Z. Psychoan.*, **3**, 376) on October 16. It is agreed that they were given on Saturdays.

it was at Otto Rank's suggestion that he agreed upon their publication. In his Preface to the *New Introductory Lectures* which has just been quoted Freud tells us that the first half of the present, earlier, series 'were improvised, and written out immediately afterwards', and that 'drafts of the second half were made during the intervening summer vacation at Salzburg, and delivered word for word in the following winter' (*RSE*, **22**, 5). He adds that at that time he 'still possessed the gift of a phonographic memory', for, however carefully his lectures might have been prepared, his actual delivery of them was invariably extempore[1] and usually without notes. There is general agreement upon his technique of lecturing: that he was never rhetorical and that his tone was always one of quiet and even intimate conversation. But it must not [6]
be supposed from this that there was anything slovenly or disordered about his lectures. They almost always had a definite form – a head, body and tail – and might often give the hearer the impression of possessing an aesthetic unity.

It has been said (Reik, 1942, 19) that he disliked lecturing, but it is difficult to reconcile this, not only with the number of lectures he delivered in the course of his life, but with the remarkably high proportion of his actually published work which is in the form of lectures. There is, however, a possible explanation for this inconsistency. Examination shows that among his publications it is predominantly the *expository* works that appear as lectures: for instance, the early lecture on 'The Aetiology of Hysteria' (1896*c*), *RSE*, **3**, the somewhat later one 'On Psychotherapy' (1905*a*), ibid., **7**, as well, of course, as the *Five Lectures* delivered in America (1910*a*), ibid., **11**, and the present series. But beyond this, when, many years afterwards, he undertook an exposition of the later developments of his views, he, for no obvious reason, once more threw them into lecture form and published his *New Introductory Lectures* (1933*a*), ibid., **22**, though there was never any possibility of their being delivered as such. Thus lectures as a method of putting forward his opinions evidently appealed to Freud, but only subject to a particular condition: he must be in a lively contact with his real or supposed audience. Readers of the present volume will discover how constantly Freud retains this contact – how regularly he puts objections into his audience's mouth and how frequently there are imaginary arguments between him and his hearers. He in fact carried over this method of stating his case to some of his works which are not lectures at all: the whole of *The Question of Lay Analysis* (1926*e*), ibid., **20**, and the greater part of *The Future of an Illusion* (1927*c*), ibid., **21**, take the form of dialogues between the author and a critical listener. Contrary, perhaps, to some mistaken notions, Freud was entirely opposed to laying down his views in an authoritarian and dogmatic fashion: 'I shall not, however, tell it you', he says to his audience at one point below (Vol. 16, p. 381), 'but shall insist on your discovering it for yourselves.' Objections were not to be shouted down but brought into the open and examined. And this, after all, was no more than an extension of an essential feature of the technique of psychoanalysis itself.

The *Introductory Lectures* may justly be regarded as a stocktaking of Freud's [7]
views and the position of psychoanalysis at the time of the First World War. The secessions of Adler and Jung were already past history, the concept of narcissism was some years old, the epoch-making case history of the 'Wolf Man' had been written (with the exception of two passages) a year before the lectures began, though it was

1 A single exception to this rule is recorded in the case of his Budapest Congress paper (1919*a*), *RSE*, **17**; cf. Jones (1953, 375 *n.*).

not published till later. So, too, the great series of 'metapsychological' papers on fundamental theory had been finished a few months earlier, though only three had been published. (Two more of them appeared soon after the lectures, but the remaining seven disappeared without leaving a trace – at least until a draft of the twelfth paper was found (Freud, 1985*a* [1915]; *RSE*, **14**, 239 ff.).) These latter activities, and no doubt the production of the lectures as well, had been facilitated by the slackening in Freud's clinical work imposed by war conditions. A watershed had apparently been reached and the time seemed to have come for a halt. But in fact fresh creative ideas were in preparation which were to see the light in *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, *Group Psychology* (1921*c*), ibid., **18**, and *The Ego and the Id* (1923*b*), ibid., **19**. Indeed, the line must not be drawn too sharply. Already, for instance, hints may be detected of the notion of the 'compulsion to repeat' (Vol. 16, p. 242), and the beginnings of the analysis of the ego are quite apparent (ibid., pp. 373 and 378), while the difficulties over the multiple senses of the term 'unconscious' (see p. 198 *n*. 2 below) are paving the way towards the new structural account of the mind.

In his Preface to these lectures Freud speaks a little depreciatively of the lack of novelty in their contents. But no-one, however well read in psychoanalytic literature, need feel afraid of being bored by them or could fail to find plenty in them that is not to be found elsewhere. The discussions on anxiety (Lecture XXV) and on primal phantasies (Lecture XXIV), which Freud himself singles out in his Preface as fresh material, are not the only ones he might have mentioned. The review of symbolism in Lecture X is probably his most complete. Nowhere does he give such a clear summary of the formation of dreams as in the last pages of Lecture XIV. There are no more understanding commentaries on the perversions than those in Lectures XX and XXI. Finally, there is no rival to the analysis of the process of psychoanalytic therapy given in the last lecture of all. And even where the subjects
[8] would seem to be well worn, such as the mechanism of parapraxes and of dreams, they are approached from unexpected directions and throw fresh illumination on what might have seemed depressingly familiar ground. The *Introductory Lectures* have thoroughly deserved their popularity.[1]

1 From their very nature these lectures touch upon a large variety of subjects, into some of which Freud (as he himself remarks in the last paragraph of the final lecture) has been unable to enter very deeply. Many readers, and especially students who find in this work their first approach to psychoanalysis, are likely to come upon some point about which they would wish to learn more. An attempt has accordingly been made in the footnotes of this edition to give particularly generous references to others of Freud's writings in which the topic in the text is dealt with at greater length.

PREFACE[1]

[1917]

What I am here offering the public as an 'Introduction to Psychoanalysis'[2] is not designed to compete in any way with such general accounts of this field of knowledge as are already in existence, e.g. those of Hitschmann (1911), Pfister (1913*b*), Kaplan (1914), Régis & Hesnard (1914) and Meijer (1915). This volume is a faithful reproduction of the lectures which I delivered [at the University of Vienna] during the two winter terms 1915/16 and 1916/17 before an audience of doctors and laymen of both sexes. [9]

Any peculiarities of this book which may strike its readers are accounted for by the conditions in which it originated. It was not possible in my presentation to preserve the unruffled calm of a scientific treatise. On the contrary, the lecturer had to make it his business to prevent his audience's attention from lapsing during a session lasting for almost two hours. The necessities of the moment often made it impossible to avoid repetitions in treating some particular subject – it might emerge once, for instance, in connection with dream interpretation and then again later on in connection with the problems of the neuroses. As a result, too, of the way in which the material was arranged, some important topics (the unconscious, for instance) could not be exhaustively treated at a single point, but had to be taken up repeatedly and then dropped again until a fresh opportunity arose for adding some further information about it.

Those who are familiar with psychoanalytic literature will find little in this 'Introduction' that could not have been known to them already from other much more detailed publications. Nevertheless, the need for rounding off and summarizing the subject matter has compelled the author at certain points (the aetiology of anxiety and hysterical phantasies) to bring forward material that he has hitherto held back. [10]

FREUD

Vienna, *Spring*, 1917

1 [This Preface was omitted from the 1922 English translation and its reissues.]

2 [A literal translation of the German title of the book would be 'Lectures to Serve as an Introduction to Psychoanalysis'.]

PREFACE TO THE HEBREW TRANSLATION[1]

[1930]

These lectures were delivered in 1916 and 1917; they gave a fairly accurate account of the position of the young science at that period and they contained more than their title indicated. They provided not only an introduction to psychoanalysis but covered the greater part of its subject matter. This is naturally no longer true. Advances have in the meantime taken place in its theory and important additions have been made to it, such as the division of the personality into an ego, a superego and an id, a radical alteration in the theory of the drives, and discoveries concerning the origin of conscience and the sense of guilt. These lectures have thus become to a large extent incomplete; it is in fact only now that they have become truly 'introductory'. But in another sense, even today they have not been superseded or become obsolete. What they contain is still believed and taught, apart from a few modifications, in psychoanalytic training schools. [11]

Readers of Hebrew and especially young people eager for knowledge are presented in this volume with psychoanalysis clothed in the ancient language which has been awakened to a new life by the will of the Jewish people. The author can well picture the problem which this has set its translator. Nor need he suppress his doubt whether Moses and the Prophets would have found these Hebrew lectures intelligible. But he begs their descendants (among whom he himself is numbered), for whom this book is designed, not to react too quickly to their first impulses of criticism and dislike by rejecting it. Psychoanalysis brings forward so much that is new, and among it so much that contradicts traditional opinions and wounds deeply rooted feelings, that it is bound at first to provoke denial [*Ablehnung*]. A reader who suspends his judgement and allows psychoanalysis as a whole to make its impression on him will perhaps become open to a conviction that even this undesired novelty [12]

1 [This Preface was first published in German in *GS*, **12** (1934), 383–4, and reprinted in *GW*, **16** (1950), 274–5. It was translated into English for the first time by James Strachey in *SE*, **15**, 11–12, and this translation (slightly revised) is reprinted here. The Hebrew translation was published by the Verlag Stybel in Jerusalem in 1930.]

is worth knowing and is indispensable for anyone who wishes to understand the mind and human life.

Vienna, *December*, 1930

PREFACE TO THE CZECH TRANSLATION[1]

(1936 [1935])

I hope that this translation of my lectures into Czech succeeds in winning adherents for the young science of psychoanalysis in the freshly blooming country.[2] Besides, it is satisfying to me – an old man – to receive a little honour in my own country, in defiance of the proverb.[3]

S. FREUD

Vienna, *April 16*, 1935

1 [This translation into English is by Mark Solms. A German retranslation appears in *GW*, **Nachtr.**, 748. No original German text is extant.]

2 [The independence of Czechoslovakia was officially proclaimed in 1918 and the republic was still flourishing in 1935, before the Anschluss and subsequent Munich agreement of 1938.]

3 [An allusion to *Matthew*, xiii, 57: 'And they were offended in him. But Jesus said unto them, A prophet is not without honour, save in his own country, and in his own house.' Freud was born in Freiberg (now Příbor), which became part of Czechoslovakia in 1918.]

PREFACE TO THE YIDDISH TRANSLATION

(1936–38)

Honourable Gentlemen:[1]

I am very pleased to receive your news that the first volume of my *Introductory Lectures* in the Yiddish translation is being published. I have looked, with great admiration, at the page proofs that you sent me. Sadly I cannot do more than this. When I was a student people did not pay any attention to the cultivation of our national traditions, and I did not learn to read Hebrew or Yiddish – a fact which I very much regret today. However, I have continued to be a good Jew, although – as you probably know – not a believer.

Do not expect an introduction from me. A few years ago I decided not to write any more introductions; and too many people would take it amiss if I were to break that resolve now.

My sincere thanks for your efforts, which will surely awaken interest in psychoanalysis among many intelligent people.

Your devoted
Freud

1 [The *Introductory Lectures* were published in a three-volume Yiddish translation (in Vilnius, Lithuania) between the years 1936 and 1938. Freud declined an invitation by the translator, Max Weinreich, to provide a preface; so he cleverly introduced the first volume with a Yiddish translation of the (undated) letter of refusal under the following heading: 'Instead of an Introduction to the Yiddish Edition: A Letter to the Executive Committee of the Yiddish Cultural Institute'. The original German text has not been reprinted. An English translation by Reuben Klingsberg was published in 1973, in *Freudiana: From the Collections of the Jewish National and University Library*, which served as the catalogue of an exhibition in the Berman Hall of the Library (Jerusalem, p. 8). The present translation is by Mark Solms.]

PART I
PARAPRAXES
(1916 [1915])

LECTURE I

INTRODUCTION

Ladies and Gentlemen, I cannot tell how much knowledge about psychoanalysis each one of you has already acquired from what you have read or from hearsay. But the wording of my prospectus – 'Elementary Introduction to Psychoanalysis'[1] – obliges me to treat you as though you knew nothing and stood in need of some preliminary information. [15]

I can, however, assume this much – that you know that psychoanalysis is a procedure for the medical treatment of neurotic patients. And here I can at once give you an instance of how in this field a number of things take place in a different way – often, indeed, in an opposite way – from what they do elsewhere in medical practice. When elsewhere we introduce a patient to a medical technique which is new to him, we usually minimize its inconveniences and give him confident assurances of the success of the treatment. I think we are justified in this, since by doing so we are increasing the probability of success. But when we take a neurotic patient into psychoanalytic treatment, we act differently. We point out the difficulties of the method to him, its long duration, the efforts and sacrifices it calls for; and as regards its success, we tell him we cannot promise it with certainty, that it depends on his own conduct, his understanding, his adaptability and his perseverance. We have good reasons, of course, for such apparently wrongheaded behaviour, as you will perhaps come to appreciate later on.

Do not be annoyed, then, if I begin by treating you in the same way as these neurotic patients. I seriously advise you not to join my audience a second time. To support this advice, I will explain to you how incomplete any instruction in psychoanalysis must necessarily be and what difficulties stand in the way of your forming a judgement of your own upon it. I will show you how the whole trend of your previous education [*Vorbildung*] and all your habits of thought are inevitably bound to make you into opponents of psychoanalysis, and how much you would have to [16] overcome in yourselves in order to get the better of this instinctive [*instinktiven*][T] opposition. I cannot, of course, foretell how much *Instinkt*

1 [See Editors' footnote above, p. 7 *n.* 2.]

understanding of psychoanalysis you will obtain from the information I give you, but I can promise you this: that by listening to it you will not have learnt how to set about a psychoanalytic investigation or how to carry a treatment through. If, however, there should actually turn out to be one of you who did not feel satisfied by a fleeting acquaintance with psychoanalysis but was inclined to enter into a permanent relationship to it, I should not merely dissuade him from doing so but actively warn him against it. As things stand at present, such a choice of profession would ruin any chance he might have of success at a university, and, if he started in life as a practising physician, he would find himself in a society which did not understand his efforts, which regarded him with distrust and hostility, and unleashed upon him all the evil spirits lurking within it. And the phenomena accompanying the war that is now raging in Europe will perhaps give you some notion of what legions of these evil spirits there may be.

Nevertheless, there are quite a number of people for whom, in spite of these inconveniences, something that promises to bring them a fresh piece of knowledge still has its attraction. If a few of you should be of this sort and in spite of my warnings appear here again for my next lecture, you will be welcome. All of you, however, have a right to learn the nature of the difficulties of psychoanalysis to which I have alluded.

I will begin with those connected with instruction, with training in psychoanalysis. In medical training you are accustomed to *see* things. You see an anatomical preparation, the precipitate of a chemical reaction, the shortening of a muscle as a result of the stimulation of its nerves. Later on, patients are demonstrated before your senses – the symptoms of their illness, the products of the pathological process and even in many cases the agent of the disease in isolation. In the surgical departments you are witnesses to the active measures taken to bring help to patients, and you may yourselves attempt to put them into effect. Even in psychiatry the demonstration of patients with their altered facial expressions, their mode of speech and their behaviour affords you plenty of observations
[17] which leave a deep impression on you. Thus a medical teacher plays in the main the part of a leader and explainer [*Erklärers*] who accompanies you through a museum, while you gain a direct contact with the objects exhibited and feel yourselves convinced of the existence of the new facts through your own perception.

In psychoanalysis, alas, everything is different. Nothing takes place in a psychoanalytic treatment but an interchange of words between the

patient and the analyst. The patient talks, tells of his past experiences and present impressions, complains, confesses to his wishes and his emotional impulses [*Gefühlsregungen*]T. The doctor listens, tries to direct the patient's processes of thought, exhorts, forces his attention in certain directions, gives him explanations [*Aufklärungen*] and observes the reactions of understanding or rejection which he in this way provokes in him. The uninstructed relatives of our patients, who are only impressed by visible and tangible things – preferably by actions of the sort that are to be witnessed at the cinema – never fail to express their doubts whether 'anything can be done about the illness by mere talking'. That, of course, is both a short-sighted and an inconsistent line of thought. These are the same people who are so certain that patients are 'simply imagining' their symptoms. Words were originally magic and to this day words have retained much of their ancient magical power. By words one person can make another blissfully happy or drive him to despair, by words the teacher conveys his knowledge to his pupils, by words the orator carries his audience with him and determines their judgements and decisions. Words provoke affects and are in general the means of mutual influence among men. Thus we shall not depreciate the use of words in psychotherapy and we shall be pleased if we can listen to the words that pass between the analyst and his patient.[1] *Regung*

But we cannot do that either. The talk of which psychoanalytic treatment consists brooks no listener; it cannot be demonstrated. A neurasthenic or hysterical patient can of course, like any other, be introduced to students in a psychiatric lecture. He will give an account of his complaints and symptoms, but of nothing else. The information required by analysis will be given by him only on condition of his having a special emotional attachment [*Gefühlsbindung*] to the doctor; he would become silent as soon as he observed a single witness to whom he felt indifferent. For this information concerns what is most intimate in his mental life [*Seelenlebens*]T, everything that, as a socially independent person, he must conceal from other people, and, beyond that, everything that, as a homogeneous personality, he will not admit to himself. [18] *Seele*

Thus you cannot be present as an audience at a psychoanalytic treatment. You can only be told about it; and, in the strictest sense of the word, it is only by hearsay that you will get to know psychoanalysis. As a result of receiving your instruction at second hand, as it were, you find yourselves under quite unusual conditions for forming a judgement.

1 [Cf. a parallel passage near the beginning of *The Question of Lay Analysis* (1926*e*), *RSE*, **20**, 167 f.]

That will obviously depend for the most part on how much credence you can give to your informant.

Let us assume for a moment that you were attending a lecture not on psychiatry but on history, and that the lecturer was telling you of the life and military deeds of Alexander the Great. What grounds would you have for believing in the truth of what he reported? At first glance the position would seem to be even more unfavourable than in the case of psychoanalysis, for the Professor of History no more took part in Alexander's campaigns than you did. The psychoanalyst does at least report things in which he himself played a part. But in due course we come to the things that confirm what the historian has told you. He could refer you to the reports given by ancient writers, who were either themselves contemporary with the events under question or, at any rate, were comparatively close to them – he could refer you, that is to say, to the works of Diodorus, Plutarch, Arrian, and so on. He could put reproductions before you of coins and statues of the king which have survived and he could hand round to you a photograph of the Pompeian mosaic of the battle of Issus. Strictly speaking, however, all these documents prove only that earlier generations already believed in Alexander's existence and in the reality of his deeds, and your criticism might start afresh at that point. You would then discover that not all that has been reported about Alexander deserves credence or can be confirmed in its details; but nevertheless I cannot think that you would leave the lecture room in
[19] doubts of the reality of Alexander the Great. Your decision would be determined essentially by two considerations: first, that the lecturer had no conceivable motive [*Motiv*]^{T} for assuring you of the reality of something he himself did not think real, and secondly, that all the available history books describe the events in approximately similar terms. If you went on to examine the older sources, you would take the same factors into account – the possible motives of the informants and the conformity of the witnesses to one another. The outcome of your examination would undoubtedly be reassuring in the case of Alexander, but would probably be different where figures such as Moses or Nimrod were concerned. Later opportunities will bring to light clearly enough what doubts you may feel about the credibility of your psychoanalytic informant.

But you will have a right to ask another question. If there is no objective verification of psychoanalysis, and no possibility of demonstrating it, how can one learn psychoanalysis at all, and convince oneself of the truth of its assertions? It is true that psychoanalysis cannot easily be learnt and there are not many people who have learnt it properly.

But of course there is a practicable method nonetheless. One learns psychoanalysis on oneself, by studying one's own personality. This is not quite the same thing as what is called self-observation, but it can, if necessary, be subsumed under it. There are a whole number of very common and generally familiar mental phenomena which, after a little instruction in technique, can be made the subject of analysis upon oneself. In that way one acquires the desired sense of conviction of the reality of the processes described by analysis and of the correctness of its views. Nevertheless, there are definite limits to progress by this method. One advances much further if one is analysed oneself by a practised analyst and experiences the effects of analysis on one's own self, making use of the opportunity of picking up the subtler technique of the process from one's analyst. This excellent method is, of course, applicable only to a single person and never to a whole lecture room of students together.

Psychoanalysis is not to be blamed for a second difficulty in your relation to it; I must make you yourselves responsible for it, ladies and gentlemen, at least insofar as you have been students of medicine. Your earlier education has given a particular direction to your thinking, which leads far [20]
away from psychoanalysis. You have been trained to find an anatomical basis for the functions of the organism and their disorders, to explain them chemically and physically and to view them biologically. But no portion of your interest has been directed to psychical life, in which, after all, the achievement of this marvellously complex organism reaches its peak. For that reason psychological modes of thought have remained foreign to you. You have grown accustomed to regarding them with suspicion, to denying them the attribute of being scientific, and to handing them over to laymen, poets, natural philosophers[1] and mystics. This limitation is without doubt detrimental to your medical activity, since, as is the rule in all human relationships, your patients will begin by presenting you with their mental façade, and I fear that you will be obliged as a punishment to leave a part of the therapeutic influence you[2] are seeking to the lay practitioners, natural healers and mystics whom you so much despise.

I am not unaware of the excuse that we have to accept for this defect in your education. No philosophical auxiliary science exists which could be made of service for your medical purposes. Neither speculative philosophy, nor descriptive psychology, nor what is called experimental psychology (which is closely allied to the physiology of the sense

1 [In the sense of followers of Schelling's pantheistic 'philosophy of nature', which prevailed in Germany during the earlier part of the nineteenth century.]

2 ['*Sie* (you)' in the earlier German editions; '*sie* (they)' in the *GS* and *GW*.]

organs), as they are taught in the universities, are in a position to tell you anything serviceable of the relation between body and mind or to provide you with the key to an understanding of possible disturbances of the mental functions. It is true that psychiatry, as a part of medicine, sets about describing the mental disorders it observes and collecting them into clinical entities; but at favourable moments the psychiatrists themselves have doubts of whether their purely descriptive hypotheses deserve the name of a science. Nothing is known of the origin, the mechanism or the mutual relations of the symptoms of which these clinical entities are composed; there are either *no* observable changes in the anatomical
[21] organ of the mind to correspond to them, or changes which throw no light upon them. These mental disorders are only accessible to therapeutic influence when they can be recognized as subsidiary effects of what is otherwise an organic illness.

This is the gap which psychoanalysis seeks to fill. It tries to give psychiatry its missing psychological foundation. It hopes to discover the common ground on the basis of which the convergence of physical and mental disorder will become intelligible. With this aim in view, psychoanalysis must keep itself free from any hypothesis that is alien to it, whether of an anatomical, chemical or physiological kind, and must operate entirely with purely psychological auxiliary ideas; and for that very reason, I fear, it will seem strange to you to begin with.

I shall not hold you, your education or your disposition responsible for the next difficulty. Two of the hypotheses of psychoanalysis are an insult to the entire world and have earned its dislike. One of them offends against an intellectual prejudice, the other against an aesthetic and moral one. We must not be too contemptuous of these prejudices; they are powerful things, precipitates of human developments that were useful and indeed essential. They are kept in existence by emotional forces
Kraft [*affektive Kräfte*][T] and the struggle against them is hard.

The first of these unpopular assertions made by psychoanalysis declares that mental processes are in themselves unconscious and that of all mental life it is only certain individual acts and portions that are conscious.[1] You know that on the contrary we are in the habit of identifying what is psychical with what is conscious. We look upon consciousness as nothing more nor less than the *defining* characteristic of the psychical,

1 ['*unbewusst*' and '*bewuss*'. It should be realized from the first that in German these words have a passive grammatical form and, generally speaking, a passive sense. In English 'conscious' and 'unconscious' *may* be used passively but as often as not are used *actively*: 'I am conscious of a pain in my toe' or 'he was unconscious of his hatred'. The German usage would rather speak of the *pain* as conscious and the *hatred* unconscious, and this is the usage adopted regularly by Freud.]

and psychology as the study of the contents of consciousness. Indeed it seems to us so much a matter of course to equate them in this way that any contradiction of the idea strikes us as obvious nonsense. Yet psychoanalysis cannot avoid raising this contradiction; it cannot accept the identity of the conscious and the mental.[1] It defines what is mental as processes such as feeling, thinking and willing, and it is obliged to maintain that there is unconscious thinking and unapprehended willing. In saying this it has from the start frivolously forfeited the sympathy of every friend of sober scientific thought, and laid itself open to the suspicion of being a fantastic esoteric doctrine eager to make mysteries and fish in troubled waters. But you, ladies and gentlemen, naturally cannot understand as yet what right I have to describe as a prejudice a statement of so abstract a nature as 'what is mental is conscious'. Nor can you guess what development can have led to a denial [*Verleugnung*][T] of the unconscious – should such a thing exist – and what advantage there may have been in that denial. The question whether we are to make the psychical coincide with the conscious or make it extend further sounds like an empty dispute about words; yet I can assure you that the hypothesis of there being unconscious mental processes paves the way to a decisive new orientation in the world and in science. [22]

You cannot have any notion, either, of what an intimate connection there is between this first piece of audacity on the part of psychoanalysis and the second one, of which I must now tell you. This second thesis, which psychoanalysis puts forward as one of its findings, is an assertion that drive impulses [*Triebregungen*][T] which can only be described as sexual, both in the narrower and wider sense of the word, play an extremely large and never hitherto appreciated part in the causation of nervous and mental diseases. It asserts further that these same sexual impulses also make contributions that must not be underestimated to the highest cultural [*kulturellen*][T], artistic and social creations of the human spirit [*Menschengeistes*].[2] *Trieb* *Kultur*

In my experience antipathy to this outcome of psychoanalytic research is the most important source of resistance which it has met with. Would you like to hear how we explain that fact? We believe that civilization [*Kultur*] has been created under the pressure of the exigencies of life at the cost of satisfaction of the drives; and we believe that civilization is to a large extent being constantly created anew, since each individual who makes a fresh entry into human society repeats this sacrifice of drive [23]

1 [The first section of Freud's paper on 'The Unconscious' (1915*e*), *RSE*, **14**, 147 ff., discusses this question at great length.]

2 [The sexual drives form the topic of Lecture XX, Vol. 16, p. 267 ff. below.]

satisfaction for the benefit of the whole community. Among the drive
Sex forces which are put to this use the sexual impulses [*Sexualregungen*][T] play an important part; in this process they are sublimated – that is to say, they are diverted from their sexual aims and directed to others that are socially higher and no longer sexual. But this arrangement [*Aufbau*][T] is unstable; the sexual drives are imperfectly tamed, and, in the case of every individual who is supposed to join in the work of civilization, there is a risk that his sexual drives may refuse to be put to that use. Society believes that no greater threat to its civilization could arise than if the sexual drives were to be liberated and returned to their original aims.[I] For this reason society does not wish to be reminded of this precarious portion of its foundations. It has no interest in the recognition of the strength of the sexual drives or in the demonstration of the importance of sexual life to the individual. On the contrary, with an educational
Erziehung [*erziehlicher*][T] aim in view, it has set about diverting attention from that whole field of ideas. That is why it will not tolerate this outcome of psychoanalytic research and far prefers to stamp it as something aesthetically repulsive and morally reprehensible, or as something dangerous. But objections of this sort are ineffective against what claims to be an objective outcome of a piece of scientific work; if the contradiction is to come into the open it must be restated in intellectual terms. Now it is inherent in human nature to have an inclination to consider a thing untrue if one does not like it, and after that it is easy to find arguments against it. Thus society makes what is disagreeable into what is untrue. It disputes the truths of psychoanalysis with logical and factual arguments; but these arise from emotional sources and it maintains these objections as prejudices, against every attempt to counter them.

We, however, ladies and gentlemen, can claim that in asserting this controversial thesis we have had no tendentious aim in view. We have
[24] merely wished to give expression to a matter of fact which we believe we have established by our painstaking labours. We claim, too, the right to reject without qualification any interference by practical considerations in scientific work, even before we have enquired whether or not the fear which seeks to impose these considerations on us is justified.

Such, then, are a few of the difficulties that stand in the way of your interest in psychoanalysis. They are perhaps more than enough for a start. But if you are able to overcome the impression they make on you, we will proceed.

1 [The antagonism between civilization and the drives received its fullest treatment by Freud in *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 93 f.]

LECTURE II

PARAPRAXES[1]

Ladies and Gentlemen, we will not start with postulates but with an [25]
investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes',[2] to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a *slip of the tongue* [*Versprechen*]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a *misreading* [*Verlesen*]), or he may hear wrongly something that has been said to him (a *mishearing* [*Verhören*]) – on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis *forgetting* [*Vergessen*] – not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a *name* which he nevertheless knows and which he recognizes at once, or he may forget to carry out an *intention*, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent – for instance in the case of *mislaying* [*Verlegen*], when a person has put something somewhere and cannot find it again, or in the [26]

1 [An alternative translation of this lecture by Shaun Whiteside, not listed in the Editors' Introduction (p. 3 ff. above), appeared under the title 'Lapses' in A. Phillips (ed.), *The Penguin Freud Reader*, London, 2006, 327–40.]

2 ['*Fehlleistungen*', literally 'faulty acts' or 'faulty functions'. The general concept did not exist before Freud, and an English term was invented for its translation (see *RSE*, **24**, 66–7, for a discussion of the term 'parapraxes'). The whole of *The Psychopathology of Everyday Life* (1901*b*) is devoted to a discussion of them. Freud often used them in his didactic writings (as he does here) as the most suitable material for an introduction to his theories. They were, indeed, among the earliest subjects of his own psychological investigations. Some account of the history of his interest in them can be found in the Editors' Introduction to the sixth volume of the *Revised Standard Edition*. Since there will be a large number of references to that work in the present lectures, the abbreviation '*PEL*' will be used here in order to economize space. The page references in all such cases will be to *RSE*, **6**.]

precisely analogous case of *losing* [*Verlieren*]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of *errors*, in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

All these are occurrences whose internal affinity with one another is expressed in the fact that [in German] they begin with the syllable '*ver*'.[1] They are almost all of an unimportant kind, most of them are very transitory, and they are without much significance in human life. Only rarely does one of them, such as losing an object, attain some degree of practical importance. For that reason, too, they attract little attention, give rise to no more than feeble emotions, and so on.

It is to these phenomena, then, that I now propose to draw your attention. But you will protest with some annoyance: 'There are so many vast problems in the wide[2] universe, as well as within the narrower confines of our minds, so many marvels in the field of mental disorders, which require and deserve to have light thrown upon them, that it does really seem gratuitous to waste labour and interest on such trivialities. If you could make us understand why a person with sound eyes and ears can see and hear in broad daylight things that are not there, why another person suddenly thinks he is being persecuted by the people of whom he has hitherto been most fond, or puts forward the cleverest arguments in support of delusional beliefs which any child could see were nonsensical, then we should have some opinion of psychoanalysis. But if it can do no more than ask us to consider why a speaker at a banquet uses one word instead of another or why a housewife has mislaid her keys, and similar futilities, then we shall know how to put our time and interest to better uses.'

I should reply: Patience, ladies and gentlemen! I think your criticism
[27] has gone astray. It is true that psychoanalysis cannot boast that it has never concerned itself with trivialities. On the contrary, the material for its observations is usually provided by the inconsiderable events which have been put aside by the other sciences as being too unimportant – the dregs, one might say, of the world of phenomena. But are you not

1 [The English syllable 'mis' has a similar sense.]

2 [In the editions from 1922 onwards this word is omitted.]

making a confusion in your criticism between the vastness of the problems and the conspicuousness of what points to them? Are there not very important things which can only reveal themselves, under certain conditions and at certain times, by quite feeble indications? I should find no difficulty in giving you several examples of such situations. If you are a young man, for instance, will it not be from small pointers that you will conclude that you have won a girl's favour? Would you wait for an express declaration of love or a passionate embrace? Or would not a glance, scarcely noticed by other people, be enough? a slight movement, the lengthening by a second of the pressure of a hand? And if you were a detective engaged in tracing a murder, would you expect to find that the murderer had left his photograph behind at the place of the crime, with his address attached? or would you not necessarily have to be satisfied with comparatively slight and obscure traces of the person you were in search of? So do not let us underestimate small indications; by their help we may succeed in getting on the track of something bigger. Furthermore, I think like you that the great problems of the universe and of science have the first claim on our interest. But it is as a rule of very little use to form an express intention of devoting oneself to research into this or that great problem. One is then often at a loss to know the first step to take. It is more promising in scientific work to attack whatever is immediately before one and offers an opportunity for research. If one does so really thoroughly and without prejudice or preconception, and if one has luck, then, since everything is related to everything, including small things to great, one may gain access even from such unpretentious work to a study of the great problems. That is what I should say in order to retain your interest, when we deal with such apparent trivialities as the parapraxes of healthy people.

Let us now call in someone who knows nothing of psychoanalysis, and ask him how he explains such occurrences. His first reply will certainly [28]
be: 'Oh! that's not worth explaining: they're just small chance events.' What does the fellow mean by this? Is he maintaining that there are occurrences, however small, which drop out of the universal concatenation of events – occurrences which might just as well not happen as happen? If anyone makes a breach of this kind in the determinism of natural events at a single point, it means that he has thrown overboard the whole *Weltanschauung* of science. Even the *Weltanschauung* of religion, we may remind him, behaves much more consistently, since it gives an explicit assurance that no sparrow falls from the roof without God's

special will. I think our friend will hesitate to draw the logical conclusion from his first reply; he will change his mind and say that after all when he comes to study these things he can find explanations of them. What is in question are small failures of functioning, imperfections in mental activity, whose determinants can be assigned. A man who can usually speak correctly may make a slip of the tongue (1) if he is slightly indisposed and tired, (2) if he is excited and (3) if he is too much occupied with other things. It is easy to confirm these statements. Slips of the tongue do really occur with particular frequency when one is tired, has a headache or is threatened with migraine. In the same circumstances proper names are easily forgotten. Some people are accustomed to recognize the approach of an attack of migraine when proper names escape them in this way.[1] When we are excited, too, we often make mistakes over words – and over *things* as well, and a 'bungled action' follows. Intentions are forgotten and a quantity of other undesigned actions become noticeable if we are absent-minded – that is, properly speaking, if we are concentrated on something else. A familiar example of this absent-mindedness is the professor in *Fliegende Blätter*[2] who leaves his umbrella behind and takes the wrong hat because he is thinking about the problems he is going to deal with in his next book. All of us can recall from our own experience instances of how we can forget intentions we have formed and promises we have made because in the meantime we have had some absorbing experience.

[29] This sounds quite reasonable and seems safe from contradiction, though it may not be very interesting, perhaps, and not what we expected. Let us look at these explanations of parapraxes more closely. The alleged preconditions for the occurrence of these phenomena are not all of the same kind. Being ill and disturbances of the circulation provide a physiological reason for the impairment of normal functioning; excitement, fatigue and distraction are factors of another sort, which might be described as psychophysiological. These last admit of easy translation [*übersetzen*] into theory. Both fatigue and distraction, and perhaps also general excitement, bring about a division of attention which may result in insufficient attention being directed to the function in question. If so, the function can be disturbed with particular ease, or carried out inaccurately. Slight illness or changes in the blood supply to the central nervous organ can have the same effect, by influencing the determining factor, the division of attention, in a similar manner. In all these cases,

1 [This was a personal experience of Freud's. *PEL*, 19.]

2 [A comic weekly.]

therefore, it would be a question of the effects of a disturbance of attention, whether from organic or psychical causes.

This does not appear to promise much for our psychoanalytic interest. We might feel tempted to drop the subject. If, however, we examine the observations more closely, what we find does not tally entirely with this attention theory of parapraxes, or at least does not follow from it naturally. We discover that parapraxes of this kind and forgetting of this kind occur in people who are *not* fatigued or absent-minded or excited, but who are in all respects in their normal state – unless we choose to ascribe *ex post facto* [*nachträglich*][T] to the people concerned, purely on account of their parapraxis, an excitement which, however, they themselves do not admit to. Nor can it be simply the case that a function is ensured by an increase in the attention directed upon it and endangered if that attention is reduced. There are a large number of procedures that one carries out purely automatically, with very little attention, but nevertheless performs with complete security. A walker, who scarcely knows where he is going, keeps to the right path for all that, and stops at his destination without having *gone astray* [*vergangen*]. Or at all events this is so as a rule. An expert pianist strikes the right keys without thinking. He may, of course, make an occasional mistake; but if automatic playing increased the danger of bungling, that danger would be at its greatest for a virtuoso, whose playing, as a result of prolonged practice, has become *entirely* automatic. We know, on the contrary, that many procedures are carried out with quite particular certainty if they are not the object of a specially high degree of attention,[1] and that the mishap of a parapraxis is liable to occur precisely if special importance is attached to correct functioning and there has therefore certainly been no distraction of the necessary attention. It could be argued that this is the result of 'excitement', but it is difficult to see why the excitement should not on the contrary *increase* the attention directed to what is so earnestly intended. If by a slip of the tongue someone says the opposite of what he intends in an important speech or oral communication, it can scarcely be explained by the psychophysiological or attention theory.

Nachträglichkeit

[30]

There are, moreover, a number of small subsidiary phenomena in the case of parapraxes, which we do not understand and on which the explanations so far given shed no light. For instance, if we have temporarily forgotten a name, we are annoyed about it, do all we can to remember it and cannot leave the business alone. Why in such cases do

1 [Freud has often suggested elsewhere that functions may be performed more accurately in the absence of conscious attention. See *PEL*, 114 f.]

we so extremely seldom succeed in directing our attention, as we are after all anxious to do, to the word which (as we say) is 'on the tip of our tongue' and which we recognize at once when we are told it? Or again: there are cases in which the parapraxes multiply, form chains, and replace one another. On a first occasion one has missed an appointment. On the next occasion, when one has firmly decided not to forget *this* time, it turns out that one has made a note of the wrong hour. Or one tries to arrive at a forgotten word by roundabout ways and thereupon a second name escapes one which might have helped one to find the first. If one searches for this second name, a third disappears, and so on. As is well known, the same thing can happen with misprints, which are to be regarded as the parapraxes of the compositor. An obstinate misprint of this kind, so it is said, once slipped into a social-democrat newspaper. Its report of some ceremonial included the words: 'Among those present was to be noticed His Highness the *Kornprinz*.' Next day an attempt was
[31] made at a correction. The paper apologized and said: 'We should of course have said "the *Knorprinz*".'[1] People speak in such cases of a 'demon of misprints' or a 'typesetting fiend' – terms which at least go beyond any psychophysiological theory of misprints.[2]

Perhaps you are familiar, too, with the fact that it is possible to *provoke* slips of the tongue, to produce them, as it were, by suggestion. An anecdote illustrates this. A stage neophyte had been cast for the important part in [Schiller's] *Die Jungfrau von Orleans* of the messenger who announces to the King that 'der Connétable schickt sein Schwert zurück [the Constable sends back his sword]'. A leading actor amused himself during the rehearsal by repeatedly inducing the nervous young man to say, instead of the words of the text: 'der Komfortabel schickt sein Pferd zurück [the cab driver sends back his horse].'[3] He achieved his aim: the wretched beginner actually made his debut at the performance with the corrupt version, in spite of having been warned against it, or perhaps *because* he had been warned.

No light is thrown on these small features of parapraxes by the theory of withdrawal of attention. The theory need not on that account be wrong, however; it may merely lack something, some addition, before it is

1 [What was intended was the '*Kronprinz* (Crown Prince)'. '*Korn*' means 'corn' and '*Knorr*' 'protuberance'.]

2 [Cf. *PEL*, 113–14.]

3 [There seems to be some confusion here. Actually (in Act I, Scene 2 of the play) it is the King himself who announces the Constable's defection.]

entirely satisfying. But some of the parapraxes, too, can themselves be looked at from another point of view.

Let us take *slips of the tongue* as the most suitable sort of parapraxis for our purpose – though we might equally well have chosen slips of the pen [*Verschreiben*] or misreading [*Verlesen*].[1] We must bear in mind that so far [32]
we have only asked when – under what conditions – people make slips of the tongue, and it is only to that question that we have had an answer. But we might direct our interest elsewhere and enquire why it is that the slip occurred in this particular way and no other; and we might take into account what it is that emerges in the slip itself. You will observe that, so long as this question is unanswered and no light thrown on the product of the slip, the phenomenon remains a chance event from the psychological point of view, even though it may have been given a physiological explanation. If I make a slip of the tongue, I might obviously do so in an infinite number of ways, the right word might be replaced by any of a thousand others, it might be distorted in countless different directions. Is there something, then, that compels me in the particular case to make the slip in one special way, or does it remain a matter of chance, of arbitrary choice, and is the question perhaps one to which no sensible answer at all can be given?

Two writers, Meringer & Mayer (a philologist and a psychiatrist), in fact made an attempt in 1895 to attack the problem of parapraxes from this angle. They collected examples and began by treating them in a purely descriptive way. This, of course, provides no explanation as yet, though it might pave the way to one. They distinguish the various kinds of distortions imposed by the slip on the intended speech as 'transpositions', 'pre-sonances [anticipations]', 'post-sonances [perseverations]', 'fusions (contaminations)' and 'replacements (substitutions)'. I will give you some examples of these main groups proposed by the authors. An instance of transposition would be to say '*the Milo of Venus*' instead of 'the Venus of Milo' (a transposition of the order of the words); an instance of a pre-sonance [anticipation] would be: 'es war mir *auf der Schwest* . . . auf der Brust so schwer';[2] and a post-sonance

1 [It is most unfortunate from the point of view of the translator that Freud chose slips of the tongue as his most frequent examples of parapraxes in all three of these lectures, since they are from their very nature peculiarly resistant to translation. We have, however, followed our invariable practice in the *Revised Standard Edition* and kept Freud's instances, with footnote and square bracket explanations, rather than replace them with extraneous English ones. Plenty of the latter can be found elsewhere, especially in papers by A. A. Brill (1912) and Ernest Jones (1911*b*).]

2 [The phrase intended was: 'it lay on my breast so heavily'. The meaningless '*Schwest*' was a distortion of '*Brust* (breast)' owing to an anticipation of the '*schw*' of '*schwer* (heavily)'. This and the preceding example are also in *PEL*, 46.]

[perseveration] would be exemplified by the well-known toast that went wrong: 'Ich fordere Sie *auf*, *auf* das Wohl unseres Chefs *auf*zustossen' [instead of *an*zustossen].[1] These three forms of slip of the tongue are not
[33] exactly common. You will come on much more numerous examples in which the slip results from contraction or fusion. Thus, for instance, a gentleman addressed a lady in the street in the following words: 'If you will permit me, madam, I should like to *begleit-digen* you.' The composite word,[2] in addition to the '*begleiten* [to accompany]', evidently has concealed in it '*beleidigen* [to insult]'. (Incidentally, the young man was not likely to have much success with the lady.) As an example of a substitution Meringer & Mayer give the case of someone saying: 'Ich gebe die Präparate in den *Brief*kasten' instead of '*Brüt*kasten'.[3]

The attempted explanation which these authors base on their collection of instances is quite peculiarly inadequate. They believe that the sounds and syllables of a word have a particular 'valency' and that the innervation of an element of high valency may have a disturbing influence on one that is less valent. Here they are clearly basing themselves on the far from common cases of pre-sonance and post-sonance; these preferences of some sounds over others (if they in fact exist) can have no bearing at all on other effects of slips of the tongue. After all, the commonest slips of the tongue are when, instead of saying one word, we say another very much like it; and this similarity is for many people a sufficient explanation of such slips. For instance, a professor declared in his inaugural lecture: 'I am not "*geneigt* [inclined]" (instead of "*geeignet* [qualified]") to appreciate the services of my highly esteemed predecessor.' Or another professor remarked: 'In the case of the female genitals, in spite of many *Versuchungen* [temptations] – I beg your pardon, *Versuche* [experiments]. . . .'[4]

The most usual, and at the same time the most striking kinds of slips of the tongue, however, are those in which one says the precise opposite of what one intended to say. Here, of course, we are very remote from relations between sounds and the effects of similarity; and instead we can
[34] appeal to the fact that contraries have a strong conceptual [*begriffliche*] kinship with each other and stand in a particularly close psychological

1 ['I call on you to *hiccough to*' (instead of 'drink to') 'the health of our chief.' This, too, occurs in *PEL*, 46 f., where, however, the translation is slightly different.]

2 [A meaningless one.]

3 ['I put the preparation into the letterbox' instead of 'incubator', literally 'hatching-box'. These last two examples occur in *PEL*, 59 and 47.]

4 [*PEL*, 60 and 68.]

association with each other.[1] There are historical examples of such occurrences. A president of the lower house of our parliament once opened the sitting with the words: 'Gentlemen: I take notice that a full quorum of members is present and herewith declare the sitting *closed*.'[2]

Any other familiar association can act in the same insidious fashion as a contrary one, and can emerge in quite unsuitable circumstances. Thus, on the occasion of a celebration in honour of the marriage of a child of Hermann von Helmholtz to a child of Werner von Siemens, the well-known inventor and industrialist, it is said that the duty of proposing the young couple's health fell to the famous physiologist Du Bois-Reymond. No doubt he made a brilliant speech, but he ended with the words: 'So, long life to the new firm of Siemens and Halske!' That was, of course, the name of the *old* firm. The juxtaposition of the two names must have been as familiar to a Berliner as Fortnum and Mason would be to a Londoner.[3]

We must therefore include among the causes of parapraxes not only relations between sounds and verbal similarity, but the influence of word associations as well. But that is not all. In a number of cases it seems impossible to explain a slip of the tongue unless we take into account something that had been said, or even merely thought, in an earlier sentence. Once again, then, we have here a case of perseveration, like those insisted upon by Meringer, but of more distant origin. – I must confess that I feel on the whole as though after all this we were further than ever from understanding slips of the tongue.

Nevertheless, I hope I am not mistaken in saying that during this last enquiry we have all of us formed a fresh impression of these instances of [35]
slips of the tongue, and that it may be worthwhile to consider that impression further. We examined the conditions under which in general slips of the tongue occur, and afterwards the influences which determine the kind of distortion which the slip produces. But we have so far paid no attention whatever to the *product* of the slip considered by itself, without reference to its origin. If we decide to do so, we are bound in the end to find the courage to say that in a few examples what results from the slip of the tongue has a sense [*Sinn*] of its own. What do we mean by 'has a sense'? That the product of the slip of the tongue may perhaps itself have a right to be regarded as a completely valid [*vollgültiger*] psychical act,

1 [Cf. below, p. 155 ff.]

2 [*PEL*, 51. The example was also used by Freud in one of his very last writings, the unfinished 'Some Elementary Lessons in Psycho-Analysis' (1940*b* [1938]), *RSE*, **23**, 265 f.]

3 [In the original: 'as Riedel and Beutel would be to a Viennese'. This last was a well-known outfitter's shop in Vienna. Siemens and Halske were, of course, the great electrical engineers.]

pursuing an aim of its own, as a statement with a content and significance. So far we have always spoken of 'parapraxes [faulty acts]', but it seems now as though sometimes the faulty act was itself quite a *normal* act, which merely took the place of the other act which was the one expected or intended.

The fact of the parapraxis having a sense of its own seems in certain cases evident and unmistakable. When the president of the lower house with his first words *closed* the sitting instead of opening it, we feel inclined, in view of our knowledge of the circumstances in which the slip of the tongue occurred, to recognize that the parapraxis had a sense. The president expected nothing good of the sitting and would have been glad if he could have brought it to an immediate end. We have no difficulty in pointing to the sense of this slip of the tongue, or, in other words, in interpreting it [*die Deutung*][T]. Or, let us suppose that one lady says to another in tones of apparent admiration: 'That smart new hat – I suppose you *aufgepatzt* [a non-existent word instead of *aufgeputzt* (trimmed)] it yourself?' Then no amount of scientific propriety will succeed in preventing our seeing behind this slip of the tongue the words: 'This hat is a *Patzerei* [botched-up affair].' Or, once more, we are told that a lady who was well known for her energy remarked on one occasion: 'My husband asked his doctor what diet he ought to follow; but the doctor told him he had no need to diet: he could eat and drink what I want.' Here again the slip of the tongue has an unmistakable other side to it: it was giving expression to a consistently planned programme.[1]

[36] If it turned out, ladies and gentlemen, that not only *a few* instances of slips of the tongue and of parapraxes in general have a sense, but a considerable number of them, the *sense* of parapraxes, of which we have so far heard nothing, would inevitably become their most interesting feature and would push every other consideration into the background. We should then be able to leave all physiological or psychophysiological factors on one side and devote ourselves to purely psychological investigations into the sense – that is, the meaning [*Bedeutung*] or purpose [*Absicht*] – of parapraxes. We shall therefore make it our business to test this expectation on a considerable number of observations.

But before carrying out this intention I should like to invite you to follow me along another track. It has repeatedly happened that a creative writer has made use of a slip of the tongue or some other parapraxis as an instrument for producing an imaginative effect. This fact alone must

1 [These two last examples appear in *PEL*, 75 and 60.]

prove to us that he regards the parapraxis – the slip of the tongue, for instance – as having a sense, since he has produced it deliberately. For what has happened is not that the author has made an accidental slip of the pen and has then allowed it to be used by one of his characters as a slip of the tongue; he intends to bring something to our notice by means of the slip of the tongue and we can enquire what that something is – whether perhaps he wants to suggest that the character in question is absent-minded and fatigued or is going to have an attack of migraine. If the author uses the slip as though it had a sense, we have no wish, of course, to exaggerate the importance of this. After all, a slip might in fact be without a sense, a chance psychical event, or it might have a sense in only quite rare cases, but the author would still retain his right to intellectualize it by *furnishing* it with a sense so as to employ it for his own purposes. Nor would it be surprising if we had more to learn about slips of the tongue from creative writers than from philologists and psychiatrists.

An example of this kind is to be found in [Schiller's] *Wallenstein* (*Piccolomini*, Act I, Scene 5). In the preceding scene Max Piccolomini has ardently espoused the Duke's [Wallenstein's] cause, and has been passionately describing the blessings of peace, of which he has become aware in the course of a journey while escorting Wallenstein's daughter to the camp. As he leaves the stage, his father [Octavio] and Questenberg, the emissary from the Court, are plunged in consternation. Scene 5 continues: [37]

QUESTENBERG Alas, alas! and stands it so?
What, friend! and do we let him go away
In this delusion – let him go away?
Not call him back immediately, not open
His eyes upon the spot?
OCTAVIO (*recovering himself out of a deep study*) He now has open'd mine,
And I see more than pleases me.
QUEST. What is it?
OCT. Curse on this journey!
QUEST. But why so? What is it?
OCT. Come, come along friend! I must follow up
The ominous track immediately. Mine eyes
Are open'd now, and I must use them. Come!
(*Draws Q. on with him.*)
QUEST. What now? *Where* go you then?
OCT. To her . . .
QUEST. To —
OCT. (*correcting himself*) To the Duke. Come let us go.

[Coleridge's translation.]

Octavio had meant to say 'to him', to the Duke. But he makes a slip of the tongue, and, by saying 'to her' he betrays to *us* at least that he has clearly recognized the influence that has made the young warrior into an enthusiast for peace.[1]

A still more impressive example has been discovered by Otto Rank [1910*c*] in Shakespeare. It is from *The Merchant of Venice*, in the famous scene in which the fortunate lover chooses between the three caskets, and perhaps I cannot do better than read you Rank's short account of it:

'A slip of the tongue occurs in Shakespeare's *Merchant of Venice* (Act III, Scene 2), which is from the dramatic point of view extremely subtly motivated and which is put to brilliant technical use. Like the slip in *Wallenstein* to which Freud has drawn attention, it shows that dramatists have a clear understanding of the mechanism and meaning of this kind of parapraxis and assume that the same is true of their audience. Portia, who by her father's will has been bound to the choice of a husband by lot, has so far escaped all her unwelcome suitors by a fortunate
[38] chance. Having at last found in Bassanio the suitor who is to her liking, she has cause to fear that he too will choose the wrong casket. She would very much like to tell him that even so he could rest assured of her love; but she is prevented by her vow. In this internal conflict the poet makes her say to the suitor she favours:

> I pray you tarry; pause a day or two
> Before you hazard: for, in choosing wrong,
> I lose your company; therefore forbear a while:
> There's something tells me (*but it is not love*)
> I would not lose you . . .
> . . . I could teach you
> How to choose right, but then I am forsworn;
> So will I never be; so may you miss me;
> But if you do you'll make me wish a sin,
> That I have been forsworn. Beshrew your eyes,
> They have o'erlooked me, and divided me;
> *One half of me is yours, the other half yours, –*
> *Mine own, I would say*; but if mine, then yours,
> And so all yours.

'The thing of which she wanted to give him only a very subtle hint, because she should really have concealed it from him altogether, namely, that even before he made his choice she was *wholly* his and loved him – it is precisely this that the poet, with a wonderful psychological sensitivity, causes to break through openly in her slip of the tongue; and by this

1 [This example and the following one also occur in *PEL*, 83–5.]

artistic device he succeeds in relieving both the lover's unbearable uncertainty and the suspense of the sympathetic audience over the outcome of his choice.'

Observe, too, how skilfully Portia in the end reconciles the two statements contained in her slip of the tongue, how she solves the contradiction between them and yet finally shows that it was the slip that was in the right:

> 'But if mine, then yours,
> And so all yours.'

It has occasionally happened that a thinker whose field lies outside medicine has, by something he says, revealed the sense of a parapraxis and anticipated our efforts at explaining them. You all know of the witty satirist Lichtenberg (1742–99), of whom Goethe said: 'Where he makes a jest a problem lies concealed.' Sometimes the jest brings the *solution* to the problem to light as well. In Lichtenberg's *Witzige und satirische Einfälle* [Witty and Satirical Thoughts, 1853] we find this: 'He had [39] read so much Homer that he always read "*Agamemnon*" instead of "*angenommen* [supposed]".' Here we have the whole theory of misreading.[1]

We must see next time whether we can go along with these writers in their view of parapraxes.

1 [Lichtenberg was a favourite author of Freud's and many of his epigrams are discussed in *Jokes and their Relation to the Unconscious* (1905*c*). The Agamemnon remark is further considered below, p. 62. It is quoted in the book on *Jokes* (*RSE*, **8**, 82) as well as in *PEL*, 97 f., where Goethe's comment also appears (*PEL*, 188).]

LECTURE III

PARAPRAXES
(continued)

[40] Ladies and Gentlemen, we arrived last time at the idea of considering parapraxes not in relation to the intended function which they disturbed but on their own account; and we formed an impression that in particular cases they seemed to be betraying a sense of their own. We then reflected that, if confirmation could be obtained on a wider scale that parapraxes have a sense, their sense would soon become more interesting than the investigation of the circumstances in which they come about.

Let us once more reach an agreement upon what is to be understood by the 'sense' of a psychical process. We mean nothing other by it than the intention it serves and its position in a psychical continuity. In most of our researches we can replace 'sense' with 'intention' or 'purpose'.[1] Was it, then, merely a deceptive illusion or a poetic exaltation of parapraxes when we thought we recognized an intention in them?

We will continue to take slips of the tongue as our examples. If we now look through a considerable number of observations of that kind, we shall find whole categories of cases in which the intention, the sense, of the slip is plainly visible. Above all there are those in which what was intended is replaced by its contrary. The president of the lower house [p. 31 above] said in his opening speech: 'I declare the sitting closed.' That is quite unambiguous. The sense and intention of his slip was that he wanted to close the sitting. 'Er sagt es ja selbst'[2] we are tempted to quote:
[41] we need only take him at his word. Do not interrupt me at this point by objecting that that is impossible, that we know that he did not want to close the sitting but to open it, and that he himself, whom we have just

1 [It has been thought best to translate the German word '*Tendenz*' by 'purpose' throughout these lectures. The meanings of the two words do not, however, coincide, and in a few passages some such rendering as 'trend' would be preferable. '*Tendenz*' is almost never equivalent to 'tendency', though the adjective '*tendenziös*' has become naturalized in the English form of 'tendentious', as applied, for instance, to a play 'with a purpose'.]

2 ['He says so himself.' This is a line from the standard German translation of a phrase in *Figaro* which occurs repeatedly in the sextet in Act III.]

recognized as the supreme court of appeal, could confirm the fact that he wanted to open it. You are forgetting that we have come to an agreement that we will begin by regarding parapraxes on their own account; their relation to the intention which they have disturbed is not to be discussed till later. Otherwise you will be guilty of a logical error by simply evading the problem that is under discussion – by what is called in English 'begging the question'.

In other cases, where the slip does not express the precise contrary, an opposite sense can nevertheless be brought out by it. 'I am not *geneigt* [inclined] to appreciate the services of my . . . predecessor' [p. 30 above]. *Geneigt* is not the contrary of *geeignet* [qualified], but it expresses openly something which contrasts sharply with the situation in which the speech was to be made.

In yet other cases the slip of the tongue merely adds a second sense to the one intended. The sentence then sounds like a contraction, abbreviation or condensation of several sentences. Thus, when the energetic lady said: 'He can eat and drink what I want' [p. 32 above], it was just as though she had said: 'He can eat and drink what he wants; but what has *he* to do with wanting? *I* will want instead of him.' A slip of the tongue often gives the impression of being an abbreviation of this sort. For instance, a professor of anatomy at the end of a lecture on the nasal cavities asked whether his audience had understood what he said and, after general assent, went on: 'I can hardly believe that, since even in a city with millions of inhabitants, those who understand the nasal cavities can be counted *on one finger*. . . . I beg your pardon, on the fingers of one hand.' The abbreviated phrase has a sense too – namely, that there is only one person who understands them.[1]

In contrast to these groups of cases, in which the parapraxis itself brings its sense to light, there are others in which the parapraxis produces nothing that has any sense of its own, and which therefore sharply contradict our expectations. If someone twists a proper name about by a slip of the tongue or puts an abnormal series of sounds together, these very common events alone seem to give a negative reply to our question [42] whether all parapraxes have some sort of sense. Closer examination of such instances, however, shows that these distortions are easily understood and that there is by no means so great a distinction between these more obscure cases and the earlier straightforward ones.

A man who was asked about the health of his horse replied: 'Well, it *draut* [a meaningless word] . . . it *dauert* [will last] another month

1 [Repeated from *PEL*, 68.]

perhaps.' When he was asked what he had really meant to say, he explained that he had thought it was a '*traurige* [sad]' story. The combination of '*dauert*' and '*traurig*' had produced '*draut*'.[1]

Another man, speaking of some occurrences he disapproved of, went on: 'But then facts came to *Vorschwein* [a non-existent word, instead of *Vorschein* (light)]. . . .' In reply to enquiries he confirmed the fact that he had thought these occurrences '*Schweinereien*' ['disgusting', literally 'piggish']. '*Vorschein*' and '*Schweinereien*' combined to produce the strange word '*Vorschwein*'.[2]

You will recall the case of the young man who asked the unknown lady if he might '*begleitdigen*' her [p. 30 above]. We ventured to divide up this verbal form into '*begleiten* [accompany]' and '*beleidigen* [insult]', and we felt certain enough of this interpretation not to need any confirmation of it. You will see from these examples that even these obscurer cases of slips of the tongue can be explained by a convergence, a mutual '*interference*', between two different intended speeches; the differences between these cases of slips arise merely from the fact that on some occasions one intention takes the place of the other completely (becomes a substitute for it), as in slips of the tongue that express the contrary, whereas on other occasions the one intention has to be satisfied with distorting or modifying the other, so that composite structures are produced, which make sense, to a greater or lesser degree, on their own account.

We seem now to have grasped the secret of a large number of slips of the tongue. If we bear this discovery in mind, we shall be able to understand other groups as well which have puzzled us hitherto. In cases of
[43] distortion of names, for instance, we cannot suppose that it is always a matter of competition between two similar but different names. It is not difficult, however, to guess the second intention. The distortion of a name occurs often enough apart from slips of the tongue; it seeks to give the name an offensive sound or to make it sound like something inferior, and it is a familiar practice (or malpractice) designed as an insult, which civilized people soon learn to abandon, but which they are *reluctant* to abandon. It is still often permitted as a 'joke', though a pretty poor one. As a blatant and ugly example of this way of distorting names, I may mention that in these days [of the First World War] the name of the President of the French Republic, Poincaré, has been changed into

1 Meringer & Mayer. [*PEL*, 50.]

2 Meringer & Mayer. [*PEL*, 49.]

'*Schweinskarré*'.[1] It is therefore plausible to suppose that the same insulting intention is present in these slips of the tongue and is trying to find expression in the distortion of a name. Similar explanations suggest themselves along the same lines for certain instances of slips of the tongue with comic or absurd results. 'I call on you to hiccough [*aufzustossen*] to the health of our chief [p. 30 above].' Here a ceremonial atmosphere is unexpectedly disturbed by the intrusion of a word which calls up an unsavoury idea, and, on the model of certain insulting and offensive phrases, we can scarcely avoid a suspicion that a purpose was trying to find expression which was in violent contradiction to the ostensibly respectful words. What the slip seems to have been saying was something like: 'Don't you believe it! I don't mean this seriously! I don't care a rap for the fellow!' Just the same thing applies to slips of the tongue which turn innocent words into indecent or obscene ones: thus, '*Apopos*' for '*à propos*' or '*Eischeissweibchen*' for '*Eiweissscheibchen*'.[2]

Many people, as we know, derive some pleasure [*Lustgewinn*][T] from a habit like this of deliberately distorting innocent words into obscene ones; such distortions are regarded as funny, and when we hear one we must in fact first enquire from the speaker whether he uttered it intentionally as a joke or whether it happened as a slip of the tongue. *Lust* [44]

Well, it looks now as though we have solved the problem of parapraxes, and with very little trouble! They are not chance events but serious mental acts; they have a sense; they arise from the concurrent action – or perhaps rather, the mutually opposing action – of two different intentions. But now I see too that you are preparing to overwhelm me with a mass of questions and doubts which will have to be answered and dealt with before we can enjoy this first outcome of our work. I certainly have no desire to force hasty decisions upon you. Let us take them all in due order, one after the other, and give them cool consideration.

What is it you want to ask me? Do I think that this explanation applies to *all* parapraxes or to only a certain number? Can this same point of view be extended to the many other kinds of parapraxis, to misreading, slips of the pen, forgetting, bungled actions, mislaying, and so on? In view of the psychical nature of parapraxes, what significance remains for the factors of fatigue, excitement, absent-mindedness and interference

1 [The Viennese term for a pork chop.]

2 Both from Meringer & Mayer. [They are also in *PEL*, 71. In the first of these untranslatable examples '*Apopos*' is a non-existent word; but '*Popo*' is a nursery word for 'bottom'. In the second example the nonsense word means literally 'egg-shit-female', while the intended word means 'small slices of white of egg'.]

with the attention? Further, it is clear that of the two competing purposes in a parapraxis one is always manifest, but the other not always. What do we do, then, in order to discover the latter? And, if we think we have discovered it, how do we prove that it is not merely a probable one but the only correct one? Is there anything else you want to ask? If not, I will go on myself. You will recall that we do not set much store by parapraxes themselves, and that all we want is to learn from studying them something that may be turned to account for psychoanalysis. I therefore put this question to you. What are these intentions or purposes which are able to disturb others in this way? And what are the relations between the disturbing purposes and the disturbed ones? Thus, no sooner is the problem solved than our work begins afresh.

First, then, is this the explanation of *all* cases of slips of the tongue? I am very much inclined to think so, and my reason is that every time one investigates an instance of a slip of the tongue an explanation of this kind is forthcoming. But it is also true that there is no way of proving that a
[45] slip of the tongue cannot occur without this mechanism. It may be so; but theoretically it is a matter of indifference to us, since the conclusions we want to draw for our introduction to psychoanalysis remain, even though – which is certainly not the case – our view holds good of only a minority of cases of slips of the tongue. The next question – whether we may extend our view to other sorts of parapraxis – I will answer in advance with a 'yes'. You will be able to convince yourselves of this when we come to examining instances of slips of the pen, bungled actions, and so on. But for technical reasons I suggest that we should postpone this task till we have treated slips of the tongue themselves still more thoroughly.

A more detailed reply is called for by the question of what significance remains for the factors put forward by the authorities – disturbances of the circulation, fatigue, excitement, absent-mindedness and the theory of disturbed attention – if we accept the psychical mechanism of slips of the tongue which we have described. Observe that we are not denying these factors. It is in general not such a common thing for psychoanalysis to *deny* something asserted by other people; as a rule it merely adds something new – though no doubt it occasionally happens that this thing that has hitherto been overlooked and is now brought up as a fresh addition is in fact the essence of the matter. The influence on the production of slips of the tongue by physiological dispositions brought about by slight illness, disturbances of the circulation or states of exhaustion must be recognized at once; daily and personal experience will convince

you of it. But how little they explain! Above all, they are not necessary preconditions of parapraxes. Slips of the tongue are just as possible in perfect health and in a normal state. These somatic factors only serve, therefore, to facilitate and favour the peculiar mental mechanism of slips of the tongue. I once used an analogy to describe this relation,[1] and I will repeat it here since I can think of none better to take its place. Suppose that one dark night I went to a lonely spot and was there attacked by a rough who took away my watch and purse. Since I did not see the robber's face clearly, I laid my complaint at the nearest police station with the words: 'Loneliness and darkness have just robbed me of my valuables.' The police officer might then say to me: 'In what you say you seem [46]
to be unjustifiably adopting an extreme mechanistic view. It would be better to represent the facts in this way: "Under the shield of darkness and favoured by loneliness, an unknown thief robbed you of your valuables." In your case the essential task seems to me to be that we should find the thief. Perhaps we shall then be able to recover the booty.'

Such psychophysiological factors as excitement, absent-mindedness and disturbances of attention will clearly help us very little towards an explanation. They are only empty phrases, screens behind which we must not let ourselves be prevented from having a look. The question is rather what it is that has been brought about here by the excitement, the particular distracting of attention. And again, we must recognize the importance of the influence of sounds, the similarity of words and the familiar associations [*Assoziationen*] aroused by words. These facilitate slips of the tongue by pointing to the paths they can take. But if I have a path open to me, does that fact automatically decide that I shall take it? I need a motive [*Motivs*][T] in addition before I resolve in favour of it and furthermore a force to propel me along the path. So these relations of sounds and words are also, like the somatic dispositions, only things that *favour* slips of the tongue and cannot provide the true explanation of them. Only consider: in an immense majority of cases my speech is not disturbed by the circumstance that the words I am using recall others with a similar sound, that they are intimately linked with their contraries or that familiar associations branch off from them. Perhaps we might still find a way out by following the philosopher Wundt, when he says that slips of the tongue arise if, as a result of physical exhaustion, the inclination to associate gains the upper hand over what the speaker otherwise intends to say. That would be most convincing if it were not contradicted by experience, which shows that in one set of cases the *somatic* factors

1 [*PEL*, 19 f.]

favouring slips of the tongue are absent and in another set of cases the *associative* factors favouring them are equally absent.

I am particularly interested, however, in your next question: how does one discover the two mutually interfering purposes? You do not realize, probably, what a momentous question this is. One of the two, the purpose that is disturbed, is of course unmistakable: the person who makes [47] the slip of the tongue knows it and admits to it. It is only the other, the disturbing purpose, that can give rise to doubt and hesitation. Now, we have already seen, and no doubt you have not forgotten, that in a number of cases this other purpose is equally evident. It is indicated by the *outcome* of the slip, if only we have the courage to grant that outcome a validity of its own. Take the president of the lower house, whose slip of the tongue said the contrary of what he intended. It is clear that he wanted to open the sitting, but it is equally clear that he also wanted to close it. That is so obvious that it leaves us nothing to interpret. But in the other cases, in which the disturbing purpose only *distorts* the original one without itself achieving complete expression, how do we arrive at the disturbing purpose from the distortion?

In a first group of cases this is done quite simply and securely – in the same way, in fact, as with the *disturbed* purpose. We get the speaker to give us the information directly. After his slip of the tongue he at once produces the wording which he originally intended: 'It *draut* . . . no, it *dauert* [will last] another month perhaps.' [p. 37 f. above.] Well, in just the same way we get him to tell us the *disturbing* purpose. 'Why', we ask him, 'did you say "*draut*"?' He replies: 'I wanted to say "It's a *traurige* [sad] story".' Similarly, in the other case, where the slip of the tongue was '*Vorschwein*' [p. 38 above], the speaker confirms the fact that he had wanted at first to say 'It's a *Schweinerei* [disgusting]', but had controlled himself and gone off into another remark. Here then the distorting purpose is as securely established as the distorted one. My choice of these examples has not been unintentional, for their origin and solution come neither from me nor from any of my followers. And yet in both these cases active measures of a kind were necessary in order to bring about the solution. The speaker had to be asked why he had made the slip and what he could say about it. Otherwise he might perhaps have passed over his slip without wanting to explain it. But when he was asked he gave the explanation with the first thing that occurred to him.[1] And now please

1 [The phrase 'thing that occurred to him' here stands for the German word '*Einfall*', for which there is no satisfactory English equivalent. The word appears constantly in the course of these lectures – two or three times in the present passage, repeatedly in Lecture VI, and at many points elsewhere – so that some comment on it will be useful. It is customarily translated 'association' –

observe that this small active step and its successful outcome are already [48]
a psychoanalysis and are a model for every psychoanalytic investigation which we shall embark upon later.

Am I too mistrustful, however, if I suspect that at the very moment at which psychoanalysis makes its appearance before you resistance to it simultaneously raises its head? Do you not feel inclined to object that the information given by the person of whom the question was asked – the person who made the slip of the tongue – is not completely conclusive? He was naturally anxious, you think, to fulfil the request to explain the slip, so he said the first thing that came into his head which seemed capable of providing such an explanation. But that is no proof that the slip did in fact take place in that way. It *may* have been so, but it may just as well have happened otherwise. And something else might have occurred to him which would have fitted in as well or perhaps even better.

It is strange how little respect you have at bottom for a psychical fact! Imagine that someone had undertaken the chemical analysis of a certain substance and had arrived at a particular weight for one component of it – so and so many milligrams. Certain inferences could be drawn from this weight. Now do you suppose that it would ever occur to a chemist to criticize those inferences on the ground that the isolated substance might equally have had some other weight? Everyone will bow before the fact that this was the weight and none other and will confidently draw his [49]
further inferences from it. But when you are faced with the psychical fact that a particular thing occurred to the mind of the person questioned, you will not allow the fact's validity: something else might have occurred to him! You nourish the illusion of there being such a thing as psychical freedom, and you will not give it up. I am sorry to say I disagree with you categorically over this.

You will break off at that, but only to take up your resistance again at another point. You proceed: 'It is the special technique of

an objectionable term, since it is ambiguous and question-begging. If a person is thinking of something and we say that he has an '*Einfall*', all that this implies is that something else has occurred to his mind. But if we say that he has an 'association', it seems to imply that the something else that has occurred to him is in some way connected with what he was thinking of before. Much of the discussion in these pages turns on whether the second thought is in fact connected (or is necessarily connected) with the original one – whether the '*Einfall*' is an 'association'. So that to translate '*Einfall*' by 'association' is bound to prejudge the issue. Nevertheless, it is not always easy to avoid this, more especially as Freud himself sometimes uses the German '*Assoziation*' as a synonym for '*Einfall*', especially in the term '*freie Assoziation*', which must inevitably be translated 'free association'. Every endeavour will be made in the present discussion to avoid ambiguity, even at the cost of some unwieldy phraseology such as 'came into his head'; later on, the need to avoid the word 'association' will become less pressing. See *RSE*, **24**, 63–4, for further discussion of the translation of '*Einfall*'.]

psychoanalysis, as we understand, to get people under analysis themselves to produce the solution to their problems. [Cf. p. 89 below.] Now let us take another example – the one in which a speaker proposing the toast of honour on a ceremonial occasion called on his audience to hiccough [*aufzustossen*] to the health of the chief [p. 30 above]. You say [p. 39] that the disturbing intention in this case was an insulting one: that was what was opposing the speaker's expression of respect. But this is pure interpretation [*Deutung*] on your part, based upon observations apart from the slip of the tongue. If in this instance you were to question the person responsible for the slip, he would not confirm your idea that he intended an insult; on the contrary, he would energetically repudiate it. Why, in view of this clear denial [*Einspruch*], do you not abandon your unprovable interpretation?'

Yes. You have lighted on a powerful argument this time. I can imagine the unknown proposer of the toast. He is probably a subordinate to the chief of the department who is being honoured – perhaps he himself is already an assistant lecturer, a young man with excellent prospects in life. I try to force him to admit that he may nevertheless have had a feeling that there was something in him opposing his toast in honour of the chief. But this lands me in a nice mess. He gets impatient and suddenly breaks out: 'Just you stop trying to cross-question me or I shall turn nasty. You're going to ruin my whole career with your suspicions. I simply said "*aufstossen* [hiccough to]" instead of "*anstossen* [drink to]" because I'd said "*auf*" twice before in the same sentence. That's what Meringer calls a perseveration and there's nothing more to be interpreted about it. D'you understand? *Basta*!' – H'm! That was a surprising reaction, a truly energetic denial. I see there's
[50] nothing more to be done with the young man. But I also reflect that he shows a strong personal interest in insisting on his parapraxis not having a sense. You may also feel that there was something wrong in his being quite so rude about a purely theoretical enquiry. But, you will think, when all is said and done he must know what he wanted to say and what he didn't.

But must he? Perhaps that may still be the question.

Now, however, you think you have me at your mercy. 'So that's your technique', I hear you say. 'When a person who has made a slip of the tongue says something about it that suits you, you pronounce him to be the final decisive authority on the subject. "He says so himself! [p. 36 above.]" But when what he says doesn't suit your book, then all at once you say he's of no importance – there's no need to believe him.'[1]

1 [A long discussion of this difficulty can be found in one of Freud's last papers, on 'Constructions in Analysis' (1937*d*), *RSE*, **23**, 233 ff.]

That is quite true. But I can put a similar case to you in which the same monstrous event occurs. When someone charged with an offence confesses his deed to the judge, the judge believes his confession; but if he denies it, the judge does not believe him. If it were otherwise, there would be no administration of justice, and in spite of occasional errors we must allow that the system works.

'Are you a judge, then? And is a person who has made a slip of the tongue brought up before you on a charge? So making a slip of the tongue is an offence, is it?'[1]

Perhaps we need not reject the comparison. But I would ask you to observe what profound differences of opinion we have reached after a little investigation of what seemed such innocent problems concerning the parapraxes – differences which at the moment we see no possible way of smoothing over. I propose a provisional compromise on the basis of the analogy with the judge and the defendant. I suggest that you shall grant me that there can be no doubt of a parapraxis having a sense if the subject himself admits it. *I* will admit in return that we cannot arrive at a direct proof of the suspected sense if the subject refuses us information, and equally, of course, if he is not at hand to give us the information. Then, as in the case of the administration of justice, we are obliged to [51] turn to circumstantial evidence, which may make a decision more probable in some instances and less so in others. In the law courts it may be necessary for practical purposes to find a defendant guilty on circumstantial evidence. We are under no such necessity; but neither are we obliged to disregard the circumstantial evidence. It would be a mistake to suppose that a science consists entirely of strictly proved theses, and it would be unjust to require this. Only a disposition with a passion for authority will raise such a demand, someone with a craving to replace his religious catechism with another, though it is a scientific one. Science has only a few apodeictic propositions in its catechism: the rest are assertions promoted by it to some particular degree of probability. It is actually a sign of a scientific mode of thought to find satisfaction in these approximations to certainty and to be able to pursue constructive work further in spite of the absence of final confirmation.

But if the subject does not himself give us the explanation of the sense of a parapraxis, where are we to find the starting points for our interpretation – the circumstantial evidence? In various directions. In the first place from analogies with phenomena apart from parapraxes: when, for instance, we assert that distorting a name when it occurs as a slip of the

1 [The German words are on the same pattern: '*Versprechen*' and '*Vergehen*'.]

tongue has the same insulting sense as a deliberate twisting of a name. Further, from the psychical situation in which the parapraxis occurs, the character of the person who makes the parapraxis, and the impressions which he has received before the parapraxis and to which the parapraxis is perhaps a reaction. What happens as a rule is that the interpretation is carried out according to general principles: to begin with there is only a suspicion, a suggestion for an interpretation, and we then find a confirmation by examining the psychical situation. Sometimes we have to wait for subsequent events as well (which have, as it were, announced themselves by the parapraxis) before our suspicion is confirmed.

I cannot easily give you illustrations of this if I limit myself to the field of slips of the tongue, though even there some good instances are to be found. The young man who wanted to '*begleitdigen*' a lady [p. 30 above] was certainly a timid character. The lady whose husband could eat and
[52] drink what *she* wanted [p. 32] is known to me as one of those energetic women who wear the breeches in their home. Or let us take the following example: At the general meeting of the 'Concordia'[1] a young member made a speech of violent opposition, in the course of which he addressed the committee as '*Vorschussmitglieder* [lending members]', a word which seems to be made up of '*Vorstand* [directors]' and '*Ausschuss* [committee]'. We shall suspect that some disturbing purpose was at work in him, acting against his violent opposition, based on something connected with a loan. And in fact we learnt from our informant that the speaker was constantly in financial difficulties and just at that time had applied for a loan. The disturbing intention could therefore be replaced with the thought: 'Moderate your opposition; these are the same people who will have to sanction your loan.'

But I can give you a large selection of circumstantial evidence of this kind if I pass over to the wide field of the other parapraxes.

If anyone forgets a proper name which is familiar to him normally or if, in spite of all his efforts, he finds it difficult to keep it in mind, it is plausible to suppose that he has something against the person who bears the name so that he prefers not to think of him. Consider, for instance, what we learn in the following cases about the psychical situation in which the parapraxis occurred.

'A Herr Y. fell in love with a lady, but he met with no success, and shortly afterwards she married a Herr X. Thereafter, Herr Y., in spite of having known Herr X. for a long time and even having business dealings

1 [The Society of Journalists in Vienna. This anecdote can be found in *PEL*, 76; it was originally supplied by Max Graf.]

with him, forgot his name over and over again, so that several times he had to enquire what it was from other people when he wanted to correspond with Herr X.' Herr Y. evidently wanted to know nothing of his more fortunate rival: 'never thought of shall he be.'[1]

Or: A lady enquired from her doctor for news of a common acquaintance, but called her by her maiden name. She had forgotten her [53]
friend's married name. She admitted afterwards that she had been very unhappy about the marriage and disliked her friend's husband.[2]

We shall have a good deal to say about forgetting names in other connections [p. 65 f. below]; for the moment we are principally interested in the psychical situation in which the forgetting occurs.

The forgetting of intentions can in general be traced to an opposing current of thought, which is unwilling to carry out the intention. But this view is not only held by us psychoanalysts; it is the general opinion, accepted by everyone in their daily lives and denied only when it comes to theory. A patron who gives his protégé the excuse of having forgotten his request fails to justify himself. The protégé immediately thinks: 'It means nothing to him; it's true he promised, but he doesn't really want to do it.'[3] For that reason forgetting is banned in certain circumstances of ordinary life; the distinction between the popular and the psychoanalytic view of these parapraxes seems to have disappeared. Imagine the lady of the house receiving her guest with the words: 'What? have you come today? I'd quite forgotten I invited you for today.' Or imagine a young man confessing to his fiancée that he had forgotten to keep their last rendezvous. He will certainly not confess it; he will prefer to invent on the spur of the moment the most improbable obstacles which prevented his appearing at the time and afterwards made it impossible for him to let her know. We all know too that in military affairs the excuse of having forgotten something is of no help and is no protection against punishment, and we must all feel that that is justified. Here all at once everyone is united in thinking that a particular parapraxis has a sense and in knowing what that sense is. Why are they not consistent enough to extend this knowledge to the other parapraxes and to admit them fully? There is of course an answer to this question too.

Since laymen have so little doubt about the sense of this forgetting of intentions, you will be the less surprised to find writers employing this

1 From Jung [1907, 52. This appears in *PEL*, 23. The quotation at the end, 'Nicht gedacht soll seiner werden', forms the first line and a repeated refrain in a poem of Heine's from the *Nachlese*, 'Aus der Matratzengruft', No. IV.]

2 From Brill [1912, 191; also *PEL*, 193].

3 [This situation is considered further below, p. 64.]

sort of parapraxis in the same sense. Any of you who have seen or read
[54] Bernard Shaw's *Caesar and Cleopatra* will remember that in the last scene Caesar, as he is leaving Egypt, is haunted by the idea [*Idee*][T] that there is something else he had intended to do but has forgotten. In the end it turns out what this was: he had forgotten to say goodbye to Cleopatra. The dramatist is seeking by this little contrivance to ascribe to the great Caesar a superiority which he did not in fact possess and which he never desired. For historical sources will tell you that Caesar made Cleopatra follow him to Rome, that she was living there with her little Caesarion when Caesar was murdered, and that she thereupon fled from the city.[1]

Cases of forgetting an intention are in general so clear that they are not of much use for our purpose of obtaining circumstantial evidence of the sense of a parapraxis from the psychical situation. Let us therefore turn to a particularly ambiguous and obscure kind of parapraxis – to losing and mislaying. You will no doubt find it incredible that we ourselves can play an intentional part in what is so often the painful [*schmerzlich*] accident of losing something. But there are plenty of observations like the following one. A young man lost a pencil of his of which he had been very fond. The day before, he had received a letter from his brother-in-law which ended with these words: 'I have neither the inclination nor the time at present to encourage you in your frivolity and laziness.' The pencil had actually been given to him by this brother-in-law. Without this coincidence we could not, of course, have asserted that a part was played in the loss by an intention to get rid of the thing.[2] Similar cases are very common. We lose an object if we have quarrelled with the person who gave it to us and do not want to be reminded of him; or if we no longer like the object itself and want to have an excuse for getting another and better one instead. The same intention directed against an object can also play a part, of course, in cases of dropping, breaking or destroying things. Can we regard it as a matter of chance when a schoolchild immediately before his birthday loses, ruins or smashes some of his personal belongings, such as his satchel or his watch?

Nor will anyone who has sufficiently often experienced the torment
[55] of not being able to find something that he himself has put away feel inclined to believe that there is a purpose in mislaying things. Yet instances are far from rare in which the circumstances attendant on the mislaying point to an intention to get rid of the object temporarily or permanently.

1 [This quotation from Shaw also appears in *PEL*, 133 *n.* 3.]

2 From Dattner. [*PEL*, 179.]

Here is the best example, perhaps, of such an occasion. A youngish man told me the following story: 'Some years ago there were misunderstandings between me and my wife. I found her too cold, and although I willingly recognized her excellent qualities we lived together without any tender feelings. One day, returning from a walk, she gave me a book which she had bought because she thought it would interest me. I thanked her for this mark of "attention", promised to read the book and put it on one side. After that I could never find it again. Months passed by, in which I occasionally remembered the lost book and made vain attempts to find it. About six months later my dear mother, who was not living with us, fell ill. My wife left home to nurse her mother-in-law. The patient's condition became serious and gave my wife an opportunity of showing the best side of herself. One evening I returned home full of enthusiasm and gratitude for what my wife had accomplished. I walked up to my desk, and without any definite intention but with a kind of somnambulistic certainty opened one of the drawers. On the very top I found the long-lost book I had mislaid.'[1] With the extinction of the motive the mislaying of the object ceased as well.

Ladies and gentlemen, I could multiply this collection of examples indefinitely; but I will not do so here. You will in any case find a profusion of case material for the study of parapraxes in my *Psychopathology of Everyday Life* (first published in 1901).[2] All these examples lead to the same result: they make it probable that parapraxes have a sense, and they show you how that sense is discovered or confirmed by the attendant circumstances. I will be briefer today, because we have adopted the limited aim of using the study of these phenomena as a help towards a preparation for psychoanalysis. There are only two groups of observa- [56]
tions into which I need enter more fully here: accumulated and combined parapraxes and the confirmation of our interpretations by subsequent events.

Accumulated and combined parapraxes are without doubt the finest flower of their kind. If we had only been concerned to prove that parapraxes have a sense we should have confined ourselves to them from the first, for in their case the sense is unmistakable even to the dull-witted and forces itself on the most critical judgement. An accumulation of these phenomena betrays an obstinacy that is scarcely ever a

1 [This appears in *PEL*, 122.]

2 See also similar collections by Maeder [1906, 1908*b*] (in French), Brill [1912] (in English), Jones [1911*b*] (in English) and J. Stärcke [1916] (in Dutch), etc.

characteristic of chance events but fits in well with something intentional. Finally, the mutual interchangeability between different species of parapraxes demonstrates what it is in parapraxes that is important and characteristic: not their form or the method which they employ but the purpose which they serve and which can be achieved in the most various ways. For this reason I will give you an instance of repeated forgetting. Ernest Jones [1911*b*, 483] tells us that once, for reasons unknown to him, he left a letter lying on his desk for several days. At last he decided to send it off, but he had it returned to him by the Dead Letter Office[1] since he had forgotten to address it. After he had addressed it he took it to the post, but this time it had no stamp. And then at last he was obliged to admit his reluctance to sending the letter off at all.

In another case a bungled action is combined with an instance of mislaying. A lady travelled to Rome with her brother-in-law, who was a famous artist. The visitor was received with great honour by the German community in Rome, and among other presents he was given an antique gold medal. The lady was vexed that her brother-in-law did not appreciate the lovely object sufficiently. When she returned home (her place in Rome having been taken by her sister) she discovered while unpacking that she had brought the medal with her – how, she did not know. She at once sent a letter with the news to her brother-in-law, and announced that she would send the article she had walked off with back to Rome next day. But next day the medal had been so cleverly mislaid that it could not be found and sent off; and it was at this point that the meaning
[57] of her 'absent-mindedness' dawned on the lady: she wanted to keep the object for herself.[2]

I have already given you an example of a combination of a forgetting with an error, the case of someone forgetting an appointment and on a second occasion, having firmly decided not to forget *this* time, turning up at the wrong hour [p. 28 above]. A very similar case was reported to me from his own experience by a friend with literary as well as scientific interests. 'Some years ago', he told me, 'I allowed myself to be elected to the committee of a certain literary society, as I thought that the organization might one day be able to help me to have my play produced; and I took a regular part, though without being much interested, in the meetings which were held every Friday. Then, a few months ago, I was given the promise of a production at the theatre at F.; and since then I have regularly *forgotten* the meetings of the society. When I read your book

1 [In English in the original. This example and the next two appear in *PEL*, 198–9.]

2 Reported by R. Reitler.

on the subject I felt ashamed of my forgetfulness. I reproached myself with the thought that it was shabby behaviour on my part to stay away now that I no longer needed these people, and resolved on no account to forget the next Friday. I kept on reminding myself of this resolution until I carried it into effect and stood at the door of the room where the meetings were held. To my astonishment it was locked; the meeting was over. I had in fact made a mistake over the day; it was now Saturday!'

It would be agreeable to add further, similar examples. But I must proceed, and give you a glimpse of the cases in which our interpretation has to wait for the future for confirmation. The governing condition of these cases, it will be realized, is that the present psychical situation is unknown to us or inaccessible to our enquiries. Our interpretation is consequently no more than a suspicion to which we ourselves do not attach too much importance. Later, however, something happens which shows us how well justified our interpretation had been. I was once the guest of a young married couple and heard the young woman laughingly describe her latest experience. The day after her return from the honeymoon she had called for her unmarried sister to go shopping with her as she used to do, while her husband went to his business. Suddenly she noticed a gentleman on the other side of the street, and nudging her [58]
sister had cried: 'Look, there goes Herr L.' She had forgotten that this gentleman had been her husband for some weeks. I shuddered as I heard the story, but I did not dare to draw the inference. The little incident occurred to my mind only some years later when the marriage had come to a most unhappy end.[1]

Maeder tells of a lady who, on the eve of her wedding, had forgotten to try on her wedding dress and, to her dressmaker's despair, only remembered it late in the evening. He connects this forgetfulness with the fact that she was soon divorced from her husband. I know a lady now divorced from her husband, who in managing her money affairs frequently signed documents in her maiden name, many years before she in fact resumed it. – I know of other women who have lost their wedding rings during the honeymoon, and I know too that the history of their marriages has given a sense to the accident. – And now here is one more glaring example, but with a happier ending. The story is told of a famous German chemist that his marriage did not take place, because he forgot the hour of his wedding and went to the laboratory instead of to the church. He was wise enough to be satisfied with a single attempt and died at a great age unmarried.

1 [This example and the next two can be found in *PEL*, 176.]

The idea may possibly have occurred to you that in these examples parapraxes have taken the place of the omens or auguries of the ancients. And indeed some omens were nothing else than parapraxes, as, for instance, when someone stumbled or fell down. Others of them, it is true, had the character of objective happenings and not of subjective acts. But you would hardly believe how difficult it sometimes is to decide whether a particular event belongs to the one group or to the other. An act so often understands how to disguise itself as a passive experience.

All those of us who can look back on a comparatively long experience of life will probably admit that we should have spared ourselves many disappointments and painful surprises if we had found the courage and determination to interpret small parapraxes experienced in our human contacts as auguries and to make use of them as indications of intentions
[59] that were still concealed. As a rule we dare not do so; it would make us feel as though, after a detour through science, we were becoming superstitious again. Nor do all auguries come true, and you will understand from our theories that they do not all need to come true.

LECTURE IV

PARAPRAXES
(concluded)

Ladies and Gentlemen, we may take it as the outcome of our efforts so far and the basis of our further investigations that parapraxes have a sense. Let me insist once again that I am not asserting – and for our purposes there is no need to do so – that every single parapraxis that occurs has a sense, even though I regard that as probably the case. It is enough for us if we can point to such a sense relatively often in the different forms of parapraxis. Moreover, in this respect these different forms behave differently. Cases of slips of the tongue and of the pen, etc., may occur on a purely physiological basis. I cannot believe that this is so in the types depending on *forgetting* (forgetting names or intentions, mislaying, etc.). It is very probable that there are cases of *losing* which can be regarded as unintended. It is in general true that only a certain proportion of the *errors* that occur in ordinary life can be looked at from our point of view. You should bear these limitations in mind when henceforward we start from the assumption that parapraxes are psychical acts and arise from mutual interference between two intentions. [60]

This is the first product of psychoanalysis. Psychology has hitherto known nothing of the occurrence of such mutual interferences or of the possibility that they might result in such phenomena. We have made a quite considerable extension to the world of psychical phenomena and have won for psychology phenomena which were not reckoned earlier as belonging to it.

Let us pause a moment longer over the assertion that parapraxes are 'psychical acts'. Does this imply more than what we have said already – that they have a sense? I think not. I think, rather, that the former assertion [that they are psychical acts] is more indefinite and more easily misunderstood. Anything that is observable in mental life may occasionally be described as a mental phenomenon. The question will then be whether the particular mental phenomenon has arisen immediately from somatic, [61] organic and material influences – in which case its investigation will not be part of psychology – or whether it is derived in the first instance from

other mental processes, somewhere behind which the series of organic influences begins. It is this latter situation that we have in view when we describe a phenomenon as a mental process, and for that reason it is more expedient to clothe our assertion in the form: 'the phenomenon has a sense'. By 'sense' we understand 'meaning', 'intention', 'purpose' and 'position in a continuous psychical context'. [Cf. p. 36 above.]

There are a number of other phenomena which are closely akin to parapraxes but to which that name is no longer appropriate. We call them chance and symptomatic actions. Like the others, they have the character of being without a motive, insignificant and unimportant; but they have in addition, more clearly, that of being unnecessary. They are distinguished from parapraxes by their lack of another intention with which they are in collision and which is disturbed by them. On the other hand, they merge insensibly into the gestures and movements which we regard as expressions of the emotions. These chance actions include all sorts of manipulations with our clothing, or parts of our body or objects within our reach, performed as though in play and apparently with no purpose, or, again, the omission of these manipulations; or, further, tunes that we hum to ourselves. I suggest that all these phenomena have a sense and can be interpreted in the same way as parapraxes, that they are small indications of more important mental processes and are fully valid psychical acts. But I do not propose to linger over this fresh extension of the field of mental phenomena; I shall return to the parapraxes, in connection with which problems important for psychoanalysis can be worked out with far greater clarity.[1]

The most interesting questions which we have raised about parapraxes and not yet answered are perhaps these. We have said that parapraxes are the product of mutual interference between two different intentions, of which one may be called the disturbed intention and the other the disturbing one. The disturbed intentions give no occasion for further [62] questions, but concerning the latter we should like to know, first, what sort of intentions emerge as a disturbance to others, and secondly what is the relation of the disturbing intentions to the disturbed ones?

If you will allow me, I will once more take slips of the tongue as representatives of the whole class and I will reply to the second question before the first.

In a slip of the tongue the disturbing intention may be related in its content to the disturbed one, in which case it will contradict it or correct

1 [Symptomatic and chance actions form the subject of Chapter IX of *PEL*.]

it or supplement it. Or – the more obscure and more interesting case – the content of the disturbing intention may have nothing to do with that of the disturbed one.

We shall have no difficulty in finding evidence of the former relation in instances we already know and in similar ones. In almost every case in which a slip of the tongue reverses the sense, the disturbing intention expresses the contrary to the disturbed one and the parapraxis represents a conflict between two incompatible inclinations. 'I declare the sitting opened, but I should prefer it to be already closed' is the sense of the president's slip of the tongue [p. 31 above]. A political periodical which had been accused of corruption defended itself in an article the climax of which should have been: 'Our readers will bear witness to the fact that we have always acted in the most *unself-seeking* manner for the good of the community.' But the editor entrusted with the preparation of the article wrote 'in the most *self-seeking* manner'. That is to say, he was thinking: 'This is what I am obliged to write; but I have different ideas.' A [German] member of parliament who was insisting that the truth should be told to the Emperor '*rückhaltlos* [unreservedly]' evidently heard an inner voice that was shocked at his boldness and, by a slip of the tongue, changed the word into '*rückgratlos* [spinelessly]'.[1]

In the instances already familiar to you which give an impression of being contractions or abbreviations, what we have before us are corrections, additions or continuations, by means of which a second purpose makes itself felt alongside of the first. 'Facts came to *Vorschein* [light] – [63]
better to say it straight out – they were *Schweinereien* [disgusting]; well then, facts came to *Vorschwein* [p. 38 above].' 'Those who understand this can be counted *on the fingers of one hand* – no, there's really only *one* person who understands it, so: can be counted *on one finger* [p. 37].' Or: 'My husband can eat and drink what he wants. But, as you know, *I* don't put up with his wanting anything at all, so: he can eat and drink what *I* want [p. 32].' In all these cases, then, the slip of the tongue arises from the content of the disturbed intention itself or is connected with it.

The other sort of relation between the two mutually interfering intentions seems puzzling. If the disturbing intention has nothing to do with the disturbed one, where can it have come from and why is it that it makes itself noticeable as a disturbance at this particular point? The observation which can alone give us the answer to this shows that the disturbance arises from a train of thought which has occupied the person

1 This was in the German Reichstag in November, 1908. [A fuller account of this appears in *PEL*, 82. The preceding slip can be found in *PEL*, 105.]

concerned a short time before and, whether or not it has already been expressed in speech, produces this subsequent effect. It must in fact, therefore, be described as a perseveration, though not necessarily as the perseveration of spoken words. In this case too an associative link between the disturbing and the disturbed intentions is present; but it does not lie in their content but is artificially constructed, often along extremely forced associative paths.

Here is a simple example of this, derived from my own observation. I once met two Viennese ladies in the lovely Dolomites, who were dressed in walking clothes. I accompanied them part of the way, and we discussed the pleasures and also the trials of spending a holiday in that way. One of the ladies admitted that spending the day like that entailed a good deal of discomfort. 'It is certainly not at all pleasant', she said, 'if one has been tramping all day in the sun and has perspired right through one's blouse and chemise.' In this sentence she had to overcome a slight hesitation at one point. Then she continued: 'But then when one gets "nach *Hose*" and can change. . . .' This slip of the tongue was not analysed but I expect you can understand it easily. The lady's intention had obviously been to give a more complete list of her clothes: blouse, chemise and *Hose* [drawers]. Reasons of propriety led her to omit any mention of the
[64] '*Hose*'. But in the next sentence, with its quite independent content, the unspoken word emerged as a distortion of the similar-sounding 'nach *Hause* [home]'.[1]

We can now turn, however, to the main question, which we have long postponed, of what sort of intentions these are, which find expression in this unusual fashion as disturbers of other intentions. Well, they are obviously of very different sorts, among which we must look for the common factor. If we examine a number of examples with this in view, they will soon fall into three groups. The first group contains those cases in which the disturbing purpose is known to the speaker and moreover had been noticed by him before he made the slip of the tongue. Thus, in the '*Vorschwein*' slip [p. 38 above] the speaker admitted not only that he had formed the judgement '*Schweinereien*' about the events in question, but also that he had had the intention, from which he afterwards drew back, of expressing his judgement in words. A second group is made up of other cases in which the disturbing purpose is equally recognized as his by the speaker, but in which he was unaware that it was active in him just before he made the slip. Thus, he accepts our interpretation of his

1 [Freud later included this anecdote in the 1917 edition of *PEL*, 55–6.]

slip, but nevertheless remains to some extent surprised at it. Instances of this kind of attitude can perhaps be found in other sorts of parapraxes more easily than in slips of the tongue. In a third group the interpretation of the disturbing intention is vigorously rejected by the speaker; he not only denies that it was active in him before he made the slip, but seeks to maintain that it is entirely foreign to him. You will recall the example of the 'hiccough' [p. 44 above] and the positively rude denial which I brought on myself from the speaker by uncovering his disturbing intention. As you know, we have not yet come to any agreement in our views on these cases. *I* should pay no attention to the denial put forward by the proposer of the toast and should persist in my interpretation unruffled, while *you*, I suppose, are still affected by his protest and raise the question of whether we ought not to give up interpreting parapraxes of this kind and regard them as purely physiological acts in the pre-analytic sense. I can well imagine what it is that deters you. My interpretation carries with it the hypothesis that intentions can find expression in a [65]
speaker of which he himself knows nothing but which I am able to infer from circumstantial evidence. You are brought up short in the face of such a novel and momentous hypothesis. I can understand that, and I see your point so far as that goes. But one thing is certain. If you want to apply consistently the view of parapraxes which has been confirmed by so many examples, you will have to make up your mind to accept the strange hypothesis I have mentioned. If you cannot do that, you will have once more to abandon the understanding of parapraxes which you have only just achieved.

Let us consider for a moment what it is that unites the three groups, what it is that the three mechanisms of slips of the tongue have in common. It is fortunately unmistakable. In the first two groups the disturbing purpose is recognized by the speaker; furthermore, in the first group that purpose announces itself immediately before the slip. But in both cases *it is forced back* [*zurückgedrangt*]. *The speaker decides not to put it into words, and after that the slip of the tongue occurs: after that, that is to say, the purpose which has been forced back is put into words against the speaker's will, either by altering the expression of the intention which he has permitted, or by mingling with it, or by actually taking its place.* This, then, is the mechanism of a slip of the tongue.

On my view, I can bring what happens in the *third* group into complete harmony with the mechanism I have described. I have only to assume that what distinguishes these three groups from one another is the differing extent to which the intention is forced back. In the first group the

intention is there and makes itself noticed before the speaker's remark; only then is it rejected; and it takes its revenge in the slip of the tongue. In the second group the rejection goes further: the intention has already ceased to be noticeable before the remark is made. Strangely enough, this does not in the least prevent it from playing its part in causing the slip. But this behaviour makes it easier for us to explain what happens in the third group. I shall venture to assume that a purpose can also find expression in a parapraxis when it has been forced back and not noticed for a considerable time, for a very long time perhaps, and can for that reason be denied [*verleugnet*][T] straight out by the speaker. But even if you leave the problem of the third group on one side, you are bound to conclude from the observations we have made in the other cases that *the suppression* [*Unterdrückung*] *of the speaker's intention to say something is the indispensable condition for the occurrence of a slip of the tongue*.

Verleugnung
[66]

We may now claim to have made further advances in our understanding of parapraxes. We know not only that they are mental acts, in which we can detect sense and intention, not only that they come about through mutual interference between two different intentions, but beyond this we know that one of these intentions must have been in some way forced back from being put into effect before it can manifest itself as a disturbance of the other intention. It must itself have been disturbed before it can become a disturber. This does not mean, of course, that we have yet achieved a complete explanation of the phenomena which we call parapraxes. We see further questions immediately cropping up, and we suspect in general that the further our understanding goes the more occasions there will be for raising fresh questions. We may ask, for instance, why things should not be much simpler. If the intention is to force back a particular purpose instead of carrying it into effect, the forcing back should be successful, so that the purpose does not manifest itself at all; or on the other hand the forcing back might fail, so that the purpose that was to have been forced back would manifest itself completely. But parapraxes are the outcome of a compromise: they constitute a half-success and a half-failure for each of the two intentions; the intention which is being challenged is neither completely suppressed nor, apart from special cases, carried through quite unscathed. We may conclude that special conditions must prevail in order that an interference or compromise of this kind shall come about, but we can form no conception of what they can be. Nor do I think that we could discover these unknown factors by going deeper into the study of parapraxes. It will be necessary, rather, to examine first yet other obscure regions of mental

life: it is only from analogies which we shall meet with there that we shall find the courage to set up the hypotheses necessary for throwing a more penetrating light upon parapraxes. And one thing more. Working from small indications, as we are constantly in the habit of doing in the present field, brings its own dangers. There is a mental disease, 'combinatory paranoia', in which the exploitation of small indications like these is carried to unlimited lengths; and I will not of course claim that conclusions built on such foundations are invariably correct. We can only be guarded against these risks by the broad basis of our observations, the repetition of similar impressions from the most varied spheres of mental life. [67]

At this point, therefore, we will leave the analysis of parapraxes. But there is one point more to which I would draw your attention. I would ask you to bear in mind as a model the manner in which we have treated these phenomena. From this example you can learn the aims of our psychology. We seek not merely to describe and to classify phenomena, but to understand them as signs of an interplay of forces in the mind, as a manifestation of purposeful intentions working concurrently or in mutual opposition. We are concerned with a *dynamic view* [*Auffassung*][T] of mental phenomena. On our view the phenomena that are perceived must yield in importance to trends which are only hypothetical.

We shall therefore not enter more deeply into parapraxes, but we may still undertake a cursory survey of the extent of this field, in the course of which we shall come once more upon things we already know but shall also discover some novelties. In this survey I shall keep to the division into three groups which I proposed to begin with:[1] slips of the tongue together with their cognate forms (slips of the pen, misreading and mishearing); forgetting, subdivided according to the objects forgotten (proper names, foreign words, intentions or impressions); and bungled actions, mislaying and losing. Errors, insofar as they concern us, fall under the headings partly of forgetting and partly of bungled actions.

We have already treated *slips of the tongue* in great detail, but there are a few more points to be added. Slips of the tongue are accompanied by certain minor emotional phenomena which are not quite without interest. No-one likes making slips of the tongue, and we often fail to hear our own slips, though never other people's. Slips of the tongue are also in a [68]

1 [At the beginning of Lecture II (p. 23 above). These 'three groups' are not to be confused with the 'three groups' discussed on pp. 56–7, which relate to the quite other matter of the attitude towards slips of the tongue adopted by those who make them.]

certain sense contagious; it is not at all easy to talk about slips of the tongue without making slips of the tongue oneself. The most trivial forms of such slips, precisely those which have no special light to throw on hidden mental processes, have reasons which are nevertheless not hard to penetrate. For instance, if someone has pronounced a long vowel short on account of a disturbance affecting the word for some reason or other, he will soon afterwards pronounce a subsequent short vowel long, thus making a fresh slip of the tongue to compensate for the earlier one. In the same way, if he pronounces a diphthong incorrectly and carelessly (for instance pronouncing an '*eu*' or '*oi*' as '*ei*') he will try to make up for it by changing a subsequent '*ei*' into an '*eu*' or '*oi*'. The decisive factor here seems to be consideration of the impression made on the audience, who are not to suppose that it is a matter of indifference to the speaker how he treats his mother tongue. The second, compensating distortion actually has the purpose of directing the hearer's attention to the first one and of assuring him that the speaker has noticed it too. The commonest, simplest and most trivial slips of the tongue are contractions and anticipations [cf. p. 29 f. above] which occur in insignificant parts of speech. For instance, in a longish sentence one may make a slip of the tongue which anticipates the last word of what one intends to say. This gives an impression of impatience to be finished with the sentence, and is evidence in general of a certain antipathy against communicating the sentence or against the whole of one's remarks. We thus arrive at marginal cases in which the distinctions between the psychoanalytic view of slips of the tongue and the ordinary physiological one melt into one another. It is to be assumed that a purpose of disturbing the intention of the speech is present in these cases but that it can only announce its presence and not what it itself has in view. The disturbance it produces then proceeds in accordance with certain phonetic influences or associative attractions and can be regarded as a distraction of the attention from the intention of the speech. But neither this disturbance of the attention nor the inclinations to associate which have become operative touch on the essence of the process. This remains, in spite of everything, the indication of the existence of an intention which is disturbing to the intention [69] of the speech, though the *nature* of this disturbing intention cannot be guessed from its consequences, as is possible in all the better-defined cases of slips of the tongue.

Slips of the pen, to which I now pass, are so closely akin to slips of the tongue that we have nothing new to expect from them. Perhaps we may glean one little further point. The extremely common small slips of the

pen, contractions and anticipations of later words (especially of final words) point, once again, to a general dislike of writing and impatience to be done with it. More marked products of miswriting enable one to recognize the nature and aim of the disturbing purpose. If one finds a slip of the pen in a letter, one knows in general that there was something the matter with its author, but one cannot always discover what was going on in him. A slip of the pen is just as often overlooked by the person responsible as is a slip of the tongue. The following is a noteworthy observation. There are, as we know, people who are in the habit of reading through every letter they write before sending it off. Others do not do this as a rule; but if, as an exception, they do so they always come across some conspicuous slip of the pen, which they can then correct. How is this to be explained? It looks as though these people knew that they had made a mistake in writing the letter. Are we really to believe this?

An interesting problem attaches to the *practical* importance of slips of the pen. You may perhaps remember the case of a murderer, H., who found the means of obtaining cultures of highly dangerous pathogenic organisms from scientific institutes by representing himself as a bacteriologist. He then used these cultures for the purpose of getting rid of his near connections by this most modern of methods. Now on one occasion this man complained to the directors of one of these institutes that the cultures that had been sent to him were ineffective; but he made a slip of the pen, and instead of writing 'in my experiments on mice or guinea-pigs' he wrote quite clearly 'in my experiments on men'.[1] The doctors at the institute were struck by the slip, but, so far as I know, drew no conclusions from it. Well, what do you think? Should not the doctors, on the contrary, have taken the slip of the pen as a confession and started an [70]
investigation which would have put an early stop to the murderer's activities? Was not ignorance of our view of parapraxes responsible in this case for an omission of practical significance? Well, I think a slip of the pen like this would certainly have seemed to me most suspicious; but something of great importance stands in the way of using it as a confession. The matter is not as simple as all that. The slip was certainly a piece of circumstantial evidence; but it was not enough in itself to start an investigation. It is true that the slip of the pen said that he was concerned with thoughts of infecting men, but it did not make it possible to decide whether these thoughts were to be taken as a clear intention to injure or as a phantasy of no practical importance. It is even possible that a man who had made a slip like this would have every subjective justification for

1 ['*Menschen*' instead of '*Mäusen oder Meerschweinchen*'.]

denying the phantasy [*Phantasie*][T] and would repudiate it as something entirely foreign to him. You will understand these possibilities still better when later on we come to consider the distinction between psychical and material reality.[1] But this is another instance of a parapraxis acquiring importance from subsequent [*nachträglich*] events. [Cf. p. 51 above.]

With *misreading* we come to a psychical situation which differs sensibly from that in slips of the tongue or pen. Here one of the two mutually competing purposes is replaced by a sensory stimulation and is perhaps on that account less resistant. What one is going to read is not a derivative of one's own mental life like something one proposes to write. In a great majority of cases, therefore, a misreading consists in a complete substitution. One replaces the word that is to be read by another, without there necessarily being any connection of content between the text and the product of the misreading, which depends as a rule on verbal similarity. The best member of this group is Lichtenberg's '*Agamemnon*' for '*angenommen*' [p. 35 above]. If we want to discover the disturbing purpose which produced the misreading we must leave the text that has been misread entirely aside and we may begin the analytic investigation with the two questions: what is the first association [*Einfall*] to the product of the misreading? and in what situation did the misreading occur? Occasionally a knowledge of the latter is alone enough to explain the
[71] misreading. For instance, a man under the pressure of an imperious need was wandering about in a strange town when he saw the word '*Closet-House*' on a large noticeboard on the first storey of a building. He had just enough time to feel surprised at the noticeboard being placed so high up before discovering that, strictly speaking, what he should have read was '*Corset-House*'.[2] In other cases a misreading precisely of the kind which is quite independent of the content of the text may call for a detailed analysis which cannot be carried through without practice in the technique of psychoanalysis and without reliance on it. As a rule, however, it is not so hard to find the explanation of a misreading: the word substituted immediately betrays, as in the Agamemnon example, the circle of ideas from which the disturbance has arisen. In this time of war, for instance, it is a very usual thing for the names of towns and generals and the military terms that are constantly buzzing around us to be read wherever a similar word meets our eyes. Whatever interests and concerns us puts itself in the place of what is strange and still uninteresting. After-images of [earlier] thoughts trouble new perceptions.

1 [See the discussion in Lecture XXIII, Vol. 16, p. 324 f. below.]

2 [Later included in the 1917 edition of *PEL*, 98–9.]

With misreading, too, there is no lack of cases of another sort, in which the text of what is read itself arouses the disturbing purpose, which thereupon, as a rule, turns it into its opposite. What we ought to read is something unwished for, and analysis will convince us that an intense wish to reject what we have read must be held responsible for its alteration.

In the more frequent cases of misreading which we mentioned first, we miss two factors to which we have assigned an important role in the mechanism of parapraxes: a conflict between two purposes and a forcing back of one of them which takes its revenge by producing a parapraxis. Not that anything contrary to this occurs in misreading. But the prominence of the thought that leads to the misreading is far more noticeable than the forcing back which it may have experienced previously.

It is these two factors which we meet with most markedly in the different situations in which parapraxes of forgetting occur. *The forgetting of intentions* is quite unambiguous; as we have already seen [p. 47 above], its interpretation is not disputed even by laymen. The purpose which disturbs the intention is in every instance a counter-intention, an unwill- [72]
ingness; and all that remains for us to learn about it is why it has not expressed itself in some other and less disguised manner. But the presence of this counterwill[1] is unquestionable. Sometimes, too, we succeed in guessing something of the motives which compel this counterwill to conceal itself; acting surreptitiously by means of the parapraxis it always achieves its aim, whereas it would be sure of repudiation if it emerged as an open contradiction. If some important change in the psychical situation takes place between the forming of the intention and its carrying out, as a result of which there is no longer any question of the intention being carried out, then the forgetting of the intention drops out of the category of parapraxes. It no longer seems strange to have forgotten it, and we realize that it would have been unnecessary to remember it: thereafter it becomes permanently or temporarily extinct. The forgetting of an intention can only be called a parapraxis if we cannot believe that the intention has been interrupted in this latter way.

The instances of forgetting an intention are in general so uniform and so perspicuous that for that very reason they are of no interest for our investigation. Nevertheless there are two points at which we can learn something new from a study of these parapraxes. Forgetting – that is,

1 [The concept of a 'counterwill' played a prominent part in some of Freud's very first papers on psychopathology, e.g. in 'A Case of Successful Treatment by Hypnotism' (1892–93*a*), *RSE*, **1**, 145 ff. It reappears at several points in *PEL*.]

failure to carry out – an intention points, as we have said, to a counterwill that is hostile to it. This is no doubt true; but our enquiries show that the counterwill can be of two kinds – direct or indirect. What I mean by the latter will best appear from one or two examples. If a patron forgets to put in a word with a third person on behalf of his protégé, this may happen because he is not really very much interested in the protégé and therefore has no great desire [*Lust*] to speak on his behalf. In any case, that is how the protégé will understand the patron's forgetting [cf. p. 47 above]. But things may be more complicated. The counterwill in the patron against carrying out the intention may come from another direction and may be aimed at quite a different point. It may have nothing to do with the protégé but may perhaps be directed
[73] against the third person to whom the recommendation was to have been made. So you see from this once more [cf. p. 61 f. above] the doubts that stand in the way of a practical application of our interpretations. In spite of the correct interpretation of the forgetting, the protégé is in danger of being too distrustful and of doing his patron a grave injustice. Or, supposing someone forgets an appointment which he has promised someone else to keep, the most frequent reason for it will be, no doubt, a direct disinclination to meeting this person. But in such a case analysis might show that the disturbing purpose did not relate to him but was directed against the place at which the meeting was planned to happen and was avoided on account of a distressing memory attaching to it. Or, again, if someone forgets to post a letter, the counter-purpose may be based on the contents of the letter; but it is by no means out of the question that the letter may be harmless in itself and may only be subject to the counter-purpose because something about it recalls another letter which had been written on some earlier occasion and which offered the counterwill a direct point of attack. It can be said, therefore, that here the counterwill was transferred [*übertragen*] from the earlier letter, which justified it, to the present one, about which it had in fact no grounds for concern. You see, then, that we must practise restraint and foresight in applying our interpretations, justified as they are: things that are psychologically equivalent may in practice have a great variety of meanings.

Phenomena such as these last may seem to you most unusual, and you will perhaps be inclined to suppose that an 'indirect' counterwill already indicates that the process is a pathological one. But I can assure you that it occurs as well within the limits of what is normal and healthy. Moreover, you should not misunderstand me. I am far from admitting that our

analytic interpretations are untrustworthy. The ambiguities in the forgetting of intentions which I have been mentioning exist only so long as we have not made an analysis of the case and are only making our interpretations on the basis of our general assumptions. If we carry out an analysis upon the person in question, we invariably learn with sufficient certainty whether the counterwill is a direct one or what other origin it may have.

The second point I have in mind [cf. p. 63 f. above] is this. If in a large majority of instances we find confirmation of the fact that the forgetting [74]
of an intention goes back to a counterwill, we grow bold enough to extend the solution to another set of instances in which the person under analysis does not confirm but denies the counterwill we have inferred. Take as examples of this such extremely common events as forgetting to return books one has been lent or to pay bills or debts. We shall venture to insist to the person concerned that an intention exists in him to keep the books and not to pay the debts, while he will deny this intention but will not be able to produce any other explanation for his behaviour. Thereupon we shall go on to say that he has this intention but knows nothing about it, but that it is enough for us that it reveals its presence by producing the forgetting in him. He may repeat to us that he has in fact forgotten. You will now recognize the situation as one in which we found ourselves once before [p. 56 f. above]. If we want to pursue our interpretations of parapraxes, which have so frequently proved justified, to a consistent conclusion, we are forced to the inescapable hypothesis that there are purposes in people which can become operative without their knowing about them. But this brings us into opposition to all the views that dominate both ordinary life and psychology.

The forgetting of proper names and foreign names, as well as of foreign words, can similarly be traced back to a counter-intention, which is aimed either directly or indirectly against the name concerned. I have already given you several instances of direct dislike [p. 46 f. above]. But indirect causation is particularly frequent in these cases and can usually only be established by careful analyses. For instance, during the present war, which has obliged us to give up so many of our former enjoyments, our power of remembering proper names has suffered greatly as the result of the strangest associations [*Verknüpfungen*]. A short time ago I found that I was unable to reproduce the name of the innocent Moravian town of *Bisenz*; and analysis showed that what was responsible for this was not any direct hostility to it but its resemblance in sound to the name of the Palazzo *Bisenzi* in Orvieto which I had repeatedly enjoyed visiting

in the past.[1] Here for the first time, in this reason for objecting to remembering a name, we come across a principle which will later on reveal its
[75] enormous importance for the causation of neurotic symptoms: the memory's disinclination to remembering anything which is connected with feelings of unpleasure [*Unlust*] and the reproduction of which would renew the unpleasure. This intention to avoid unpleasure arising from a recollection or from other psychical acts, this psychical flight from unpleasure, may be recognized as the ultimate operative motive not only for the forgetting of names but for many other parapraxes, such as omissions, errors, and so on.

The forgetting of names, however, seems particularly facilitated [*erleichtert*] psychophysiologically, and for that reason cases occur in which interference by the unpleasure motive cannot be confirmed. If someone has a tendency to forget names, analytic investigation will show that names escape him not only because he does not like them themselves or because they remind him of something disagreeable, but also because in his case the same name belongs to another circle of associations [*Assoziationskreis*] with which he is more intimately related. The name is, as it were, anchored there and is kept from contact with the other associations which have been momentarily activated. If you recall the tricks of mnemotechnics,[2] you will realize with some surprise that the same chains of association which are deliberately laid down in order to *prevent* names from being forgotten can also *lead* to our forgetting them. The most striking example of this is afforded by the proper names of persons, which naturally possess quite different psychical importance for different people. Let us, for instance, take a first name such as Theodore. To one of you it will have no special meaning, to another it will be the name of his father or brother or of a friend, or his own name. Analytic experience will then show you that the first of these people is in no danger of forgetting that a particular stranger bears this name, whereas the others will be constantly inclined to withhold from strangers a name which seems to them reserved for intimate connections. If you now bear in mind that this associative inhibition [*Hemmung*][T] may coincide with the operation of the unpleasure principle[3] and, besides that, with an
[76] indirect mechanism, you will be in a position to form an adequate idea of the complications in the causation of the temporary forgetting of a name.

1 [This example was added in 1917 to *PEL*, 30.]

2 [Artificial methods of improving the memory – e.g. 'Pelmanism'.]

3 [Since the time of *The Interpretation of Dreams* (1900*a*) where the principle is so named (e.g. *RSE*, **5**, 537), Freud had almost invariably spoken of the 'pleasure principle'. It is discussed under this latter name in Lecture XXII, Vol. 16, p. 314 f. below.]

An appropriate analysis will however unravel every one of these tangles for you.

The forgetting of impressions and experiences demonstrates much more clearly and exclusively than the forgetting of names the operation of the purpose of keeping disagreeable things out of memory. The whole field of this kind of forgetting does not, of course, fall within the class of parapraxes, but only such cases as, measured by the standard of our usual experience, seem to us striking and unjustified: for instance, when the forgetting affects impressions that are too fresh or important, or when the missing memory tears a gap in what is otherwise a well-remembered chain of events. Why and in what way we are able to forget in general, and among other things experiences which have certainly left the deepest impression upon us, such as the events of our earliest childhood years – that is quite another problem, in which fending off [*Abwehr*][T] unpleasurable impulses plays a certain part but is far from being the whole explanation.[1] It is an undoubted fact that disagreeable impressions are easily forgotten. Various psychologists have noticed it and the great Darwin was so much impressed by it that he made it 'a golden rule' to note down with special care any observations which seemed unfavourable to his theory, since he had convinced himself that precisely they would not remain in his memory.[2]

A person who hears for the first time of this principle of the fending off of unpleasurable memories by forgetting rarely fails to object that on the contrary it has been his experience that distressing things are particularly hard to forget but keep on returning to torment him against his will – memories, for instance, of insults and humiliations. This is also a true fact, but the objection is not to the point. It is important to begin in good time to reckon with the fact that mental life is the arena and battleground for mutually opposing purposes or, to put it non-dynamically, that it [77] consists of contradictions and pairs of contraries. Proof of the existence of a particular purpose is no argument against the existence of an opposite one; there is room for both. It is only a question of the attitude of these contraries to each other, and of what effects are produced by the one and by the other.

Losing and mislaying [*Verlegen*] are of particular interest to us owing to the many meanings they may have – owing, that is, to the multiplicity of

1 [Infantile amnesia is discussed in Lecture XIII, p. 173 f. below. For a discussion of forgetting in general, see a long footnote added to *PEL*, 235–6 *n.* 3, in 1907.]

2 [The whole passage from Darwin's autobiography (1958, 123) is quoted in *PEL*, 129 *n.* 2.]

the purposes which can be served by these parapraxes. All cases have in common the fact that there was a wish to lose something; they differ in the basis and aim of that wish. We lose a thing when it is worn out, when we intend to replace it with a better one, when we no longer like it, when it originates from someone with whom we are no longer on good terms or when we acquired it in circumstances we no longer want to recall. [Cf. p. 48 above.] Dropping, damaging or breaking the object can serve the same purpose. In the sphere of social life experience is said to have shown that unwanted and illegitimate children are far more frail than those legitimately conceived. The crude technique of baby-farmers[I] is not necessary for bringing about this result; a certain amount of neglect in looking after the children should be quite sufficient. The preserving of *things* may be subject to the same influences as that of children.

Things may, however, be condemned to be lost without their value having suffered any diminution – when, that is, there is an intention to sacrifice something to Fate in order to ward off some other dreaded loss. Analysis tells us that it is still quite a common thing among us to exorcize Fate in this way; and thus our losing is often a voluntary sacrifice. In the same way, losing may also serve the purpose of defiance or self-punishment. In short, the more remote reasons for the intention to get rid of a thing by losing it are beyond number.

Bungled actions, like other errors, are often used to fulfil wishes which one ought to deny [*versagen*][T] oneself. Here the intention disguises itself as a lucky accident. For instance, as happened to one of my friends, a man may be due, obviously against his will, to go by train to visit someone near the town where he lives, and then, at a junction where he has to change, may by mistake get on to a train that takes him back to where he came from. Or someone on a journey may be anxious to make a stop at an intermediate station but may be forbidden from doing so by other obligations, and he may then overlook or miss some connection so that he is after all obliged to break his journey in the way he wished. Or what happened to one of my patients: I had forbidden him to telephone the girl he was in love with, and then, when he meant to telephone me, he asked for the wrong number 'by mistake' or 'while he was thinking of something else' and suddenly found himself connected to the girl's number.[2] A good example of an outright blunder, and one of practical

Versagung

[78]

1 [In the original literally 'what are known as angel-makers'.]

2 [These last three examples are described much more fully in *PEL*, 191–2 and 195–6.]

importance, is provided by an observation made by an engineer in his account of what preceded a case of material damage:

'Some time ago I worked with several fellow students in the laboratory of the technical college on a series of complicated experiments in elasticity, a piece of work which we had undertaken voluntarily but which was beginning to take up more time than we had expected. One day as I returned to the laboratory with my friend F., he remarked how annoying it was to him to lose so much time on that particular day as he had so much else to do at home. I could not help agreeing with him and added half-jokingly, referring to an incident the week before: "Let us hope that the machine will go wrong again so that we can stop work and go home early."

'In arranging the work it happened that F. was given the regulation of the valve of the press; that is to say, he was, by cautiously opening the valve, to let the fluid under pressure flow slowly out of the accumulator into the cylinder of the hydraulic press. The man conducting the experiment stood by the manometer and when the right pressure was reached called out a loud "Stop!" At the word of command F. seized the valve and turned it with all his might – to the left! (All valves without exception are closed by being turned to the right.) This caused the full pressure of the accumulator to come suddenly on to the press, a strain for which the connecting pipes are not designed, so that one of them immediately burst – quite a harmless accident to the machine, but enough to oblige us to [79] suspend work for the day and go home.

'It is characteristic, by the way, that when we were discussing the affair some time later my friend F. had no recollection whatever of my remark, which I recalled with certainty.'[1]

This may lead you to suspect that it is not always just an innocent chance that turns the hands of your domestic servants into dangerous enemies of your household belongings. And you may also raise the question whether it is always a matter of chance when people injure themselves and risk their own safety. These are notions whose value you may care to test, if occasion arises, by analysing observations of your own.

This, ladies and gentlemen, is far from being all that might be said about parapraxes. Much remains that might be examined and discussed. But I am satisfied if our discussion of the subject so far has to some extent shaken your previous views and has made you a little prepared to accept new ones. I am content, for the rest, to leave you faced with an

1 [Reproduced from *PEL*, 150–1.]

unclarified situation. We cannot establish all our doctrines from a study of parapraxes and we are not obliged to draw our evidence from that material alone. The great value of parapraxes for our purposes lies in their being very common phenomena which, moreover, can easily be observed in oneself, and which can occur without the slightest implication of illness. There is only one of your unanswered questions which I should like to put into words before I end. If, as we have found from many instances, people come so close to an understanding of parapraxes and so often behave as though they grasped their sense, how is it possible that they nonetheless set down these same phenomena as being in general chance events without sense or meaning, and that they can oppose the psychoanalytic elucidation of them with so much vigour?

You are right. This is a remarkable fact and it calls for an explanation. But I will not give you one. Instead, I will introduce you by degrees to fields of knowledge from which the explanation will force itself upon you without any contribution of mine.

PART II
DREAMS
(1916 [1915–16])

LECTURE V

DIFFICULTIES AND FIRST APPROACHES

Ladies and Gentlemen, it was discovered one day that the pathological [83]
symptoms of certain neurotic patients have a sense.[1] On this discovery the psychoanalytic method of treatment was founded. It happened in the course of this treatment that patients, instead of bringing forward their symptoms, brought forward dreams. A suspicion thus arose that the dreams too had a sense.[2]

We will not, however, follow this historical path, but will proceed in the opposite direction. We will demonstrate the sense of dreams by way of preparing for the study of the neuroses. This reversal is justified, since the study of dreams is not only the best preparation for the study of the neuroses, but dreams are themselves a neurotic symptom, which, moreover, offers us the priceless advantage of occurring in all healthy people.[3] Indeed, supposing all human beings were healthy, so long as they dreamt we could arrive from their dreams at almost all the discoveries which the investigation of the neuroses has led to.

Dreams, then, have become a subject of psychoanalytic research: once [84]
again ordinary phenomena, with little value set on them, and apparently of no practical use – like parapraxes, with which indeed they have in common the fact of occurring in healthy people. But apart from this the conditions for our work are a good deal less favourable here. Parapraxes had merely been neglected by science, little attention had been paid to them; but at least there was no harm in concerning oneself with them.

1 By Josef Breuer in the years 1880–2. Cf. the lectures delivered by me in America in 1909 (*Five Lectures on Psychoanalysis* [1910*a*; *RSE*, **11**]) and 'On the History of the Psychoanalytic Movement' [1914*d*; ibid., **14**].

2 [Freud's major work on the subject of dreams was, of course, *The Interpretation of Dreams* (1900*a*), ibid., **4** and **5**. There is, however, scarcely one of his writings in which the topic did not emerge, but a list of the principal discussions of it is given in an Appendix to that work (ibid., **5**, 568). A considerable number of references to it can be found in editorial footnotes to the present set of lectures; and, to save space, the abbreviation '*I. of D.*' will be used, with application in every case to Volumes 4 and 5 of the *Revised Standard Edition*.]

3 [Freud discussed this further towards the end of the last lecture of the series (Vol. 16, p. 403 f. below).]

'No doubt', people would say, 'there are more important things. But something may possibly come of it.' But to concern oneself with dreams is not merely unpractical and uncalled for, it is positively disgraceful. It brings with it the odium of being unscientific and rouses the suspicion of a personal inclination to mysticism. Imagine a medical man going in for dreams when there are so many more serious things even in neuropathology and psychiatry – tumours as big as apples compressing the organ of the mind, haemorrhages, chronic inflammation, in all of which the changes in the tissues can be demonstrated under the microscope! No, dreams are much too trivial, and unworthy to be an object of research.

And there is something else which from its very nature frustrates the requirements of exact research. In investigating dreams one is not even certain about the object of one's research. A delusion [*Wahnidee*], for instance, meets one squarely and with definite outlines. 'I am the Emperor of China', says the patient straight out. But dreams? As a rule no account at all can be given of them. If anyone gives an account of a dream, has he any guarantee that his account has been correct, or that he may not, on the contrary, have altered his account in the course of giving it and have been obliged to invent some addition to it to make up for the indistinctness of his recollection? Most dreams cannot be remembered at all and are forgotten except for small fragments. And is the interpretation of material of this kind to serve as the basis of a scientific psychology or as a method for treating patients?

An excess of criticism may make us suspicious. These objections to dreams as an object of research are obviously carried too far. We have already dealt with the question of unimportance in connection with parapraxes [p. 24 f. above]. We have told ourselves that big things can show themselves by small indications. As regards their indistinctness –
[85] that is one of the characteristics of dreams, like any other: we cannot lay down for things what their characteristics are to be. And incidentally there are clear and distinct dreams as well. There are, moreover, other objects of psychiatric research which suffer from the same characteristic of indistinctness – in many instances, for example, obsessions
Zwang [*Zwangsvorstellungen*][T], and these have been dealt with, after all, by respected and esteemed psychiatrists.[1] I recall the last such case that I came across in my medical practice. This was a woman patient who

1 [The tendency of obsessional neurotics to uncertainty and vagueness had been discussed by Freud in Section B of Part II of his 'Notes upon a Case of Obsessional Neurosis' (1909*d*), *RSE*, **10**, 174 ff. See also the account of that form of illness in Lecture XVII, Vol. 16, p. 228 ff. below.]

introduced herself with these words: 'I have a sort of feeling as though I had injured or had wanted to injure some living creature – a child? – no, more like a dog – as though I may have thrown it off a bridge, or something else.' We can help to overcome the defect of the uncertainty in remembering dreams if we decide that whatever the dreamer tells us must count as his dream, without regard to what he may have forgotten or have altered in recalling it. And finally it cannot even be maintained so sweepingly that dreams are unimportant things. We know from our own experience that the mood in which one wakes up from a dream may last for the whole day; doctors have observed cases in which a mental disease has started with a dream and in which a delusion originating in the dream has persisted; historical figures are reported to have embarked on momentous enterprises in response to dreams. We may therefore ask what may be the true source of the contempt in which dreams are held in scientific circles.

It is, I believe, a reaction against the overvaluation of dreams in earlier days. The reconstruction of the past is, as we know, no easy matter, but we may assume with certainty, if I may put it as a joke, that our ancestors three thousand or more years ago already had dreams like ours. So far as we know, all the peoples of antiquity attached great significance to dreams and thought they could be used for practical purposes. They deduced signs for the future from them and searched in them for auguries. For the Greeks and other oriental nations, there may have been times when a campaign without dream interpreters seemed as impossible as [86] one without air-reconnaissance seems today. When Alexander the Great started on his conquests, his train included the most famous dream interpreters. The city of Tyre, which at that time still stood on an island, offered the king such a stiff resistance that he considered the possibility of raising the siege. Then one night he had a dream of a satyr who seemed to be dancing in triumph, and when he reported it to his dream interpreters they informed him that it foretold his conquest of the city. He ordered an assault and captured Tyre.[1] Among the Etruscans and Romans other methods of foretelling the future were in use; but throughout the whole of the Hellenistic-Roman period the interpretation of dreams was practised and highly esteemed. Of the literature dealing with the subject the principal work at least has survived: the book by Artemidorus of Daldis, who probably lived during the reign of the Emperor Hadrian.[2] How it came about after this that the art of interpreting dreams declined

1 [The explanation of this dream is given in Lecture XV, p. 206 below.]

2 [Some account of this work appears in *I. of D.*, **4**, 3 and 88 *n.* 1.]

and that dreams fell into discredit I cannot tell you. The spread of enlightenment cannot have had much to do with it, for many things more absurd than the dream interpretation of antiquity were faithfully preserved in the obscurity of the Middle Ages. The fact remains that interest in dreams gradually sank to the level of superstition and could survive only among the uneducated classes. The final abuse of dream interpretation was reached in our days with attempts to discover from dreams the numbers fated to be drawn in the game of lotto. On the other hand, the exact science of today has repeatedly concerned itself with dreams but always with the sole aim of applying its physiological theories to them. Medical men, of course, looked on dreams as non-psychical acts, as the expression in mental life of somatic stimuli. Binz (1878, [35]) pronounced that dreams are 'somatic processes, which are in every case useless and in many cases positively pathological, to which the soul of the universe and immortality are as sublimely superior as the blue sky above some weed-grown, low-lying stretch of sand'. Maury [1878, 50] compares dreams to
[87] the disordered twitchings of St Vitus's dance as contrasted with the coordinated movements of a healthy man. According to an old analogy, the contents of a dream are like the sounds produced when 'the ten fingers of a man who knows nothing of music wander over the keys of a piano' [Strümpell, 1877, 84].

Interpreting means finding a hidden sense in something; there can of course be no question of doing that if we adopt this last estimate of the function of dreams. Look at the description of dreams given by Wundt [1874], Jodl [1896], and other more recent philosophers. They content themselves with enumerating the respects in which dream life differs from waking thought, always in a sense depreciatory to dreams – emphasizing the fact that associations are broken apart, that the critical faculty ceases to work, that all knowledge is eliminated, as well as other signs of diminished functioning. The only valuable contribution to the knowledge of dreams for which we have to thank exact science relates to the effect produced on the content of dreams by the impact of somatic stimuli during sleep. A recently deceased Norwegian author, J. Mourly Vold, published two stout volumes of experimental researches into dreams (German edition, 1910 and 1912), which are devoted almost exclusively to the consequences of alterations in the posture of the limbs. They have been recommended to us as models of exact research into dreams. Can you imagine what exact science would say if it learnt that we want to make an attempt to discover the *sense* of dreams? Perhaps it has already said it. But we will not let ourselves be frightened off.

If it was possible for parapraxes to have a sense, dreams can have one too; and in a great many cases parapraxes *have* a sense, which has escaped exact science. So let us embrace the prejudice of the ancients and of the people and let us follow in the footsteps of the dream interpreters of antiquity.

We must begin by finding our bearings in the task before us and taking a general survey of the field of dreams. What, then, is a dream? It is hard to answer in a single sentence. But we will not attempt a definition when it is enough to point to something familiar to everyone.[1] We should, however, bring the essential feature of dreams into prominence. Where is that to be found, though? There are such immense differences within [88] the frame that comprises our subject – differences in every direction. The essential feature will presumably be something that we can point to as common to all dreams.

The first thing common to all dreams would seem to be, of course, that we are asleep during them. Dreaming is evidently mental life during sleep – something which has certain resemblances to waking mental life but which, on the other hand, is distinguished from it by large differences. This was, long ago, Aristotle's definition.[2] It may be that there are still closer connections between dreams and sleep. We can be woken by a dream; we very often have a dream when we wake up spontaneously or if we are forcibly aroused from sleep. Thus dreams seem to be an intermediate state between sleeping and waking. So our attention is turned to sleep. Well, then, what is sleep?

That is a physiological or biological problem about which much is still in dispute. On that we can come to no conclusion; but we ought, I think, to try to describe the psychological characteristics of sleep. Sleep is a state in which I want to know nothing of the external world, in which I have taken my interest away from it. I put myself to sleep by withdrawing from the external world and keeping its stimuli away from me. I also go to sleep when I am fatigued by it. So when I go to sleep I say to the external world: 'Leave me in peace: I want to go to sleep.' On the contrary, children say: 'I'm not going to sleep yet; I'm not tired, and I want to have some more experiences.' The biological purpose of sleep seems therefore to be rehabilitation, and its psychological characteristic suspense of interest in the world. Our relation to the world, into which we have come so unwillingly, seems to involve our not being able to tolerate

1 [Cf., however, some remarks on this in Lecture XIV, p. 195 below.]

2 [Cf. *I. of D.*, **4**, 2–3.]

it uninterruptedly. Thus from time to time we withdraw into the premundane state, into existence in the womb. At any rate, we arrange conditions for ourselves very like what they were then: warm, dark and free from stimuli. Some of us roll ourselves up into a tight package and, so as to sleep, take up a posture much as it was in the womb. The world, it seems, does not possess even those of us who are adults completely, but only up to two thirds; one third of us is still quite unborn. Every time we
[89] wake in the morning it is like a new birth. Indeed, in speaking of our state after sleep, we say that we feel as though we were newly born. (In saying this, incidentally, we are making what is probably a very false assumption about the general sensations of a newborn child, who seems likely, on the contrary, to be feeling very uncomfortable.) We speak, too, of being born as 'first seeing the light of day'.[1]

If this is what sleep is, dreams cannot possibly form part of its programme, but seem on the contrary to be an unwelcome addition to it. In our opinion too, a dreamless sleep is the best, the only proper one. There ought to be no mental activity in sleep; if it begins to stir, we have not succeeded in establishing the foetal state of rest: we have not been able entirely to avoid residues of mental activity. Dreaming would consist in these residues. But if so, it would really seem that there is no need for dreams to have any sense. It was different with parapraxes; they, after all, were activities during waking life. But if I am asleep and have stopped mental activity completely and have merely failed to suppress some residues of it, then there is no need whatever for these residues to have any sense. I cannot even make use of any such sense, since the rest of my mental life is asleep. So it really can only be a matter of reactions, in the nature of 'twitchings', of mental phenomena such as result directly from a somatic stimulus. Dreams would accordingly be residues of waking mental activity which were disturbing sleep, and we might well decide to drop the subject at once, as not being suited to psychoanalysis.

Even if dreams are superfluous, however, they do exist, and we can try to account for their existence. Why does mental life fail to go to sleep? Probably because there is something that will not allow the mind any peace. Stimuli impinge upon it and it must react to them. A dream, then, is the manner in which the mind reacts to stimuli that impinge upon it in the state of sleep. And here we see a way of access to an understanding of dreams. We can take various dreams and try to discover what the stimulus was which was seeking to disturb sleep and to which the reaction was

1 [In German, literally 'seeing the light of the world'.]

a dream. Our examination of the first thing common to all dreams seems to have taken us so far.

Is there anything else common to them? Yes, something unmistakable [90]
but much harder to grasp and to describe. Mental processes in sleep have a quite different character from those of waking life. We experience every sort of thing in dreams and believe in it, whereas nevertheless we experience nothing, except, perhaps, the single disturbing stimulus. We experience it predominantly in visual images; feelings may be present too, and thoughts interwoven in it as well; the other senses may also experience something, but nonetheless it is predominantly a question of images. Part of the difficulty of giving an account of dreams is due to our having to translate these images into words. 'I could draw it', a dreamer often says to us, 'but I don't know how to say it.' This is not, however, a *reduced* mental activity, like that of a feeble-minded person as compared to that of a genius: it is *qualitatively* different, though it is hard to say where the difference lies. G. T. Fechner [1889] once voiced a suspicion that the scene of action of dreams (in the mind) is different from that of waking ideational life.[1] Though we do not understand this and do not know what we are to make of it, it does in fact reproduce the impression of strangeness which most dreams make on us. The comparison between dream activity and the effects of an unmusical hand on the piano [p. 76 above] does not help us here. The piano will after all respond with the same sounds, though not with tunes, to any chance pressure on its keys. Let us carefully bear this second thing common to all dreams in mind, even though we may not have understood it.

Are there any other things common to them? I cannot discover any; I can see nothing anywhere but differences, and differences in all kinds of ways: in their apparent duration, as well as in their clarity, in the amount of affect accompanying them, in the possibility of retaining them, and so on. This variety is not in fact what we might expect to find in a mere defensive reaction to a stimulus, something mechanically imposed, an empty thing, like the twitchings of St Vitus's dance. As regards the dimensions of dreams, some are very short and comprise only a single image or a few, a single thought, or even a single word; others are

1 [The psychophysicist Fechner (1801–87) had a great influence on Freud's theories (see his *Autobiographical Study* (1925*d*), *RSE*, **20**, 52). The present remark is discussed in *I. of D.*, **4**, 43, and **5**, 478.]

[91] uncommonly rich in their content, present whole novels and seem to last a long time. There are dreams which are as clear as [waking] experience, so clear that quite a time after waking we do not realize that they were dreams; and there are others which are indescribably dim, shadowy and blurred. Indeed in one and the same dream excessively definite portions may alternate with others of scarcely discernible vagueness. Dreams may be entirely sensible or at least coherent, witty even, or fantastically beautiful; others, again, are confused, feeble-minded as it were, absurd, often positively crazy. There are dreams that leave us quite cold and others in which affects of all kinds are manifest – pain to the point of tears, anxiety to the point of waking us up, astonishment, delight, and so on. Dreams are usually quickly forgotten after waking, or they may last through the day, remembered more and more dimly and incompletely till evening; others, again – for instance, childhood dreams – are so well preserved that after thirty years they remain in the memory like some fresh experience. Dreams may appear, like individuals, on a single occasion only and never again, or they may recur in the same person unchanged or with small divergences. In short, this fragment of mental activity during the night has an immense repertory at its disposal; it is capable, in fact, of all that the mind creates in daytime – yet it is never the same thing.

We might try to account for these many variations in dreams by supposing that they correspond to different intermediate stages between sleeping and waking, different degrees of incomplete sleep. Yes, but if this were so, the value, content and clarity of a dream's product – and the awareness, too, of its being a dream – would have to increase in dreams in which the mind was coming near to waking; and it would not be possible for a clear and rational fragment of dream to be immediately followed by one that was senseless and obscure and for this in turn to be followed by another good piece. The mind could certainly not alter the depth of its sleep so quickly as that. So this explanation is of no help: there can be no shortcut out of the difficulty.

We will for the moment leave on one side the 'sense' of dreams, and try to make our way to a better understanding of them from what we have [92] found is common to them. We inferred from the relation of dreams to the state of sleep that dreams are the reaction to a stimulus which disturbs sleep. We have learnt that this too is the single point on which exact experimental psychology is able to come to our assistance: it brings us evidence that stimuli which impinge during sleep make their

appearance in dreams. Many investigations of this kind have been made, most recently those by Mourly Vold which I have already mentioned [p. 76 above]; and each of us, no doubt, has been in a position to confirm this finding from personal observation. I will select a few of the earlier experiments. Maury [1878] had some experiments performed on himself. He was given some eau-de-cologne to smell in his sleep. He dreamt he was in Cairo, in Johann Maria Farina's shop, and some further absurd adventures followed. Or, he was pinched lightly on the neck; he dreamt of a mustard plaster being applied to him and of a doctor who had treated him as a child. Or again, a drop of water was dropped on his forehead; he was in Italy, was sweating violently and was drinking white Orvieto wine.[1]

The striking thing about these experimentally produced dreams will perhaps be even more plainly visible in another series of stimulus dreams. They are three dreams reported by an intelligent observer, Hildebrandt [1875], all of them reactions to the ringing of an alarm-clock:

'I dreamt, then, that one spring morning I was going for a walk and was strolling through the green fields till I came to a neighbouring village, where I saw the villagers in their best clothes, with hymn books under their arms, flocking to the church. Of course! It was Sunday, and early morning service would soon be beginning. I decided I would attend it; but first, as I was rather hot from walking, I went into the churchyard which surrounded the church, to cool down. While I was reading some of the tombstones, I heard the bell-ringer climbing up the church tower and at the top of it I now saw the little village bell which would presently give the signal for the beginning of devotions. For quite a while it hung there motionless, then it began to swing, and suddenly its peal began to ring out clear and piercing – so clear and piercing that it put an end to my sleep. But what was ringing was the alarm-clock.

'Here is another instance. It was a bright winter's day and the streets [93]
were covered with deep snow. I had agreed to join a party for a sleigh-ride; but I had to wait a long time before news came that the sleigh was at the door. Now followed the preparations for getting in – the fur rug spread out, the foot-muff put ready – and at last I was sitting in my seat. But even then the moment of departure was delayed till a pull at the reins gave the waiting horses the signal. Then off they started, and, with a violent shake, the sleigh bells broke into their familiar jingle – with such violence, in fact, that in a moment the cobweb of my dream was torn through. And once again it was only the shrill sound of the alarm-clock.

1 [For these and several other of Maury's experiments see *I. of D.*, **4**, 23.]

'And now yet a third example. I saw a kitchen-maid, carrying several dozen plates piled on one another, walking along the passage to the dining room. The column of china in her arms seemed to me in danger of losing its balance. "Take care," I exclaimed, "or you'll drop the whole load." The inevitable rejoinder duly followed: she was quite accustomed to that kind of job, and so on. And meanwhile my anxious looks followed the advancing figure. Then – just as I expected – she stumbled at the threshold and the fragile crockery slipped and rattled and clattered in a hundred pieces on the floor. But the noise continued without ceasing, and soon it seemed no longer to be a clattering; it was turning into a ringing – and the ringing, as my waking self now became aware, was only the alarm-clock doing its duty.'[1]

These are very nice dreams, entirely sensible and by no means as incoherent as dreams are usually apt to be. I am not objecting to them on that account. What they have in common is that in each case the situation ends in a noise, which, when the dreamer wakes up, is recognized as being made by the alarm-clock. So we see here how a dream is produced; but we learn something more than this. The dream does not recognize the alarm-clock – nor does it appear in the dream – but it replaces the noise of the alarm-clock with another; it interprets the stimulus which is bringing sleep to an end, but it interprets it differently each time. Why does it do that? There is no answer to this; it seems a matter of caprice. Understanding the dream would mean being able to
[94] say why this particular noise and none other was chosen for the interpretation of the stimulus from the alarm-clock. We may make an analogous objection to Maury's experiments: we can see quite clearly that the impinging stimulus appears in the dream; but why it should take this particular form we are not told, and it does not seem by any means to follow from the nature of the stimulus that disturbed sleep. In Maury's experiments, too, a quantity of other dream material usually appears in addition to the direct effect of the stimulus – for instance, the 'absurd adventures' in the eau-de-cologne dream – which cannot be accounted for.

And now consider that *arousal* dreams offer the best chance of establishing the influence of external sleep-disturbing stimuli. In most other cases it will become more difficult. We do not wake out of every dream, and if we remember a dream of the past night in the morning, how are we to discover a disturbing stimulus which may perhaps have made its impact on us during the night? I once succeeded in identifying a sound

1 [Also quoted in *I. of D.*, **4**, 25–6.]

stimulus of that kind retrospectively [*nachträglich*], but only, of course, owing to special circumstances. I woke up one morning in a mountain resort in the Tyrol, knowing I had had a dream that the Pope was dead. I could not explain the dream to myself; but later on my wife asked me if I had heard the fearful noise made by the pealing of bells towards morning which had broken out from all the churches and chapels. No, I had heard nothing, my sleep is more resistant than hers; but thanks to her information I understood my dream.[1] How often may stimuli of this kind instigate dreams in a sleeper without his getting news of them afterwards? Perhaps very often, but perhaps not. If the stimulus can no longer be pointed to, we cannot be convinced of its existence. And in any case we have changed our view of the importance of external stimuli that disturb sleep since we learnt that they can explain only a small portion of the dream and not the whole dream reaction.

There is no need to give up this theory entirely on that account. Moreover it is capable of extension. It is obviously a matter of indifference what it is that disturbs sleep or instigates the mind to dream. If it cannot invariably be a sensory stimulus coming from outside, there may instead be what is called a somatic stimulus, arising from the internal organs. This is a very plausible notion and agrees with the most popular view of [95]
the origin of dreams: 'dreams come from indigestion', people often say. Here too unluckily we must often suspect that there are cases when a somatic stimulus which has impinged on a sleeper during the night is no longer manifest after waking and can therefore not be proved to have occurred. But we shall not overlook the number of clear experiences which support the origin of dreams from somatic stimuli. In general, there can be no doubt that the condition of the internal organs can influence dreams. The relation of the content of some dreams to an overfull bladder or to a state of excitation of the genital organs is too plain to be mistaken. These clear cases lead to others in which the content of the dreams gives rise to a justifiable suspicion that there has been an impact from somatic stimuli because there is something in the content which can be regarded as a working over, a representation or an interpretation of such stimuli. Scherner (1861), who made researches into dreams, argued particularly strongly in favour of the derivation of dreams from organic stimuli and brought forward some good examples of it. For instance, in one dream he saw 'two rows of pretty boys with fair hair and delicate complexions facing one another in pugnacious array, making an onset and attacking one another, and then drawing back and

1 [Told at greater length, *I. of D.*, **4**, 206.]

taking up their old position again, and then starting the whole business once more'. His interpretation of these two rows of boys as teeth is plausible in itself and seems fully confirmed when we learn that after this scene the dreamer 'pulled a long tooth out of his jaw'.[1] Similarly, the interpretation of 'long, narrow, winding passages' as derived from an intestinal stimulus seems valid, and confirms the assertion by Scherner that dreams seek above all to represent the organ that sends out the stimulus by objects resembling it.

Thus we must be prepared to admit that internal stimuli can play the same part in dreams as external ones. Any estimate of their importance is unfortunately open to the same objections. In a large number of cases an interpretation pointing to a somatic stimulus is uncertain or unprovable. Not all dreams, but only a certain number of them give rise to a suspicion that internal organic stimuli had a share in their origin. And lastly, internal somatic stimuli are as little able as external sensory stimuli to explain [96] more of a dream than what corresponds in it to a direct reaction to the stimulus. Where the rest of the dream comes from remains obscure.

Let us notice, however, one peculiarity of dream life which comes to light in this study of the effects of stimuli. Dreams do not simply reproduce the stimulus; they work it over, they make allusions to it, they include it in some context, they replace it with something else. This is a side of the dream-work[2] which is bound to interest us since it may perhaps bring us nearer to the essence of dreams. When a person constructs something as a result of a stimulus, the stimulus need not on that account exhaust the whole of the work. Shakespeare's *Macbeth*, for instance, was a *pièce d'occasion* composed to celebrate the accession of the king who first united the crowns of the three kingdoms. But does this immediate historical occasion cover the content of the tragedy? Does it explain its greatnesses and its enigmas? It may be that the external and internal stimuli, too, impinging on the sleeper, are only the *instigators* of the dream and will accordingly betray nothing to us of its essence.

The second thing that is common to dreams, their psychical peculiarity [p. 79 above], is on the one hand hard to grasp and on the other offers us no starting point for further enquiry. We experience things in dreams as a rule in visual forms. Can the stimuli throw any light on this? Is what we experience in fact the stimulus? But, if so, why is the experience visual, while it is only in the rarest cases that optical stimulation has

1 [*I. of D.*, **4**, 201.]

2 [*Traumarbeit*. The process which transforms the latent thoughts behind the dream into its manifest form. This is the subject of Lecture XI, p. 148 ff. below.]

instigated the dream? Or if we dream spoken words, can it be shown that during sleep a conversation, or some noise resembling one, made its way into our ears? I venture to dismiss that possibility decisively.

If we can get no further with what is common to dreams, let us see whether their differences can help us. Dreams are, of course, often senseless, confused and absurd; but there are also sensible, matter-of-fact and reasonable ones. Let us enquire whether the latter, the sensible ones, can throw any light on the senseless ones. Here is the latest reasonable dream that I have had reported to me. It was dreamt by a young man: 'I went for [97]
a walk along the Kärntnerstrasse[1] and met Herr X. there and joined him for a time. Then I went into a restaurant. Two ladies and a gentleman came and sat at my table. I was annoyed at this to begin with and wouldn't look at them. Then I did look and found that they were quite nice.' The dreamer commented on this that on the evening before the dream he had in fact walked along the Kärntnerstrasse, which is the way he usually goes, and had met Herr X. there. The other part of the dream was not a direct recollection, and only had some similarity to an experience a considerable time earlier. Or here is another matter-of-fact dream, this time a lady's: 'Her husband asked her: "Don't you think we ought to have the piano tuned?" And she replied: "It's not worthwhile; the hammers need reconditioning in any case."'[2] This dream repeated, without much alteration, a conversation which had taken place between her and her husband the day before the dream. What do we learn from these two reasonable dreams? Nothing except that they contain repetitions from daily life or things connected with it. That would already be something, if it could be said of dreams generally. But there is no question of that; it applies only to a minority, and in most dreams there is no sign of a connection with the day before,[3] and no light is thrown by this on the senseless and absurd dreams. It only shows that we have come upon a new task. We not only want to know what a dream says, but, if it speaks clearly, as it does in these examples of ours, we also want to know why and for what purpose this familiar material, only recently experienced, has been repeated in the dream.

I think that, like me, you must be tired of pursuing enquiries like those we have so far been making. All one's interest in a problem is evidently

1 [The principal shopping street in Vienna.]

2 [*I. of D.*, **4**, 164.]

3 [A qualification of this statement is to follow shortly (p. 93).]

insufficient unless one knows as well of a path of approach that will lead to its solution. We have not yet found such a path. Experimental psychology has brought us nothing but some very valuable information on the significance of stimuli as instigators to dreaming. We have nothing to
[98] expect from philosophy except that it will once again haughtily point out to us the intellectual inferiority of the object of our study. Nor have we any wish to borrow anything from the occult sciences. History and popular opinion tell us that dreams have a sense and a meaning: that they look into the future – which is hard to accept and certainly incapable of proof. So our first effort leaves us completely at a loss.

Unexpectedly, a hint reaches us from a direction in which we have not so far looked. Linguistic usage, which is no chance thing, but the precipitate of old discoveries, though, to be sure, it must not be employed incautiously – our language, then, is acquainted with things that bear the strange name of 'daydreams'. Daydreams are phantasies [*Phantasien*] (products of the imagination); they are very general phenomena, observable, once more, in healthy as well as in sick people, and are easily accessible to study in our own mind. The most remarkable thing about
Bildung these imaginative structures [*phantastischen Bildungen*][T] is that they have been given the name of 'daydreams', for there is no trace in them of the two things that are common to dreams [p. 77 ff. above]. Their relation to sleep is already contradicted by their name; and, as regards the second thing common to dreams, we do not experience or hallucinate anything in them but imagine something, we know that we are having a phantasy, we do not see but think. These daydreams appear in the prepubertal period, often in the later part of childhood even; they persist until maturity is reached and are then either given up or maintained till the end of life. The content of these phantasies is dominated by a very transparent motive. They are scenes and events in which the subject's egoistic needs of ambition and power or his erotic wishes find satisfaction. In young men the ambitious phantasies are the most prominent, in women, whose ambition is directed to success in love, the erotic ones. But in men, too, erotic needs are often enough present in the background: all their heroic deeds and successes seem only to aim at courting the admiration and favour of women. In other respects these daydreams are of many different kinds and pass through changing vicissitudes. They are either, each one of them, dropped after a short time and replaced with a fresh one, or they are retained, spun out into long stories and adapted to the
[99] changes in the circumstances of the subject's life. They go along with the times, so to speak, and receive a 'date stamp' which bears witness to

the influence of the new situation. They are the raw material of poetic production, for the creative writer uses his daydreams, with certain remodellings, disguises and omissions, to construct the situations which he introduces into his short stories, his novels or his plays. The hero of the daydreams is always the subject himself, either directly or by an obvious identification with someone else.[1]

It may be that daydreams bear their name on account of having the same relation to reality – in order to indicate that their content is to be looked on as no less unreal than that of dreams. But perhaps they share this name because of some psychical characteristic of dreams which is still unknown to us, one which we are in search of. It is also possible that we are being quite wrong in trying to make use of this similarity of name as something significant. Only later will it be possible to clear this up.

1 [Freud's chief discussion of phantasies and of their relation to artistic creation can be found in two of his earlier papers: 'Creative Writers and Daydreaming' (1908*e*), *RSE*, **9**, 123 ff., and 'Hysterical Phantasies and their Relation to Bisexuality' (1908*a*), ibid., **9**, 137 ff. He returns to the subject below, in the later part of Lecture XXIII, Vol. 16.]

LECTURE VI

THE PREMISES AND TECHNIQUE OF INTERPRETATION

[100] Ladies and Gentlemen, what we need, then, is a new path, a method which will enable us to make a start in the investigation of dreams. I will put a suggestion to you which presents itself. Let us take it as a premise from this point onwards that *dreams are not somatic but psychical phenomena*. You know what that means, but what justifies our making the assumption? Nothing: but there is nothing either to prevent our making it. Here is the position: if dreams are somatic phenomena they are no concern of ours, they can only interest us on the assumption that they are mental phenomena. We will therefore work on the assumption that they really are, to see what comes of it. The outcome of our work will decide whether we are to hold to this assumption and whether we may then go on to treat it in turn as a proved finding. But what is it actually that we want to arrive at? What is our work aiming at? We want something that is sought for in all scientific work – to understand the phenomena, to establish a correlation between them and, in the latter end, if it is possible, to enlarge our power over them.

We proceed with our work, accordingly, on the supposition that dreams are psychical phenomena. In that case they are products and utterances of the dreamer's, but utterances which tell us nothing, which we do not understand. Well, what do you do if I make an unintelligible utterance to you? You question me, is that not so? Why should we not do the same thing to the dreamer – *question him as to what his dream means*?

As you will remember, we found ourselves in this situation once before. It was while we were investigating certain parapraxes – a case of a slip of the tongue. Someone had said [p. 38 above]: 'Then facts came to *Vorschwein*' and we thereupon asked him – no, it was luckily not we but some other people who had no connection at all with psychoanalysis – these other people, then, asked him what he meant by this unintelligible
[101] remark. And he replied at once that he had intended to say 'these facts were *Schweinereien* [disgusting]', but had forced this intention back in

favour of the milder version 'then facts came to *Vorschein* [light]'. I pointed out to you at the time [p. 43 above] that this piece of information was the model for every psychoanalytic investigation, and you will understand now that psychoanalysis follows the technique of getting the people under examination so far as possible themselves to produce the solution to their riddles [p. 43 f.]. Thus, too, it is the dreamer himself who should tell us what his dream means.

But, as we know, things are not so simple with dreams. With parapraxes it worked all right in a number of cases; but then others came along in which the person who was questioned would say nothing, and even indignantly rejected the answer we proposed to him. With dreams cases of the first sort are entirely lacking; the dreamer always says he knows nothing. He cannot reject our interpretation as we have none to offer him. Are we to give up our attempt then? Since he knows nothing and we know nothing and a third person could know even less, there seems to be no prospect of finding out. If you feel inclined, then, give up the attempt! But if you feel otherwise, you can accompany me further. For I can assure you that it is quite possible, and highly probable indeed, that the dreamer *does* know what his dream means: *only he does not know that he knows it and for that reason thinks he does not know it*.

You will point out to me that I am once more introducing an assumption, the second already in this short argument, and that in doing so I am enormously reducing my procedure's claim to credibility: 'Subject to the premise that dreams are psychical phenomena, and subject to the further premise that there are mental things in a man which he knows without knowing that he knows them . . .' and so on. If so, one has only to consider the internal improbability of each of these two premises, and one can quietly divert one's interest from any conclusions that may be based on them.

I have not brought you here, ladies and gentlemen, to delude you or to conceal things from you. In my prospectus, it is true, I announced a course of 'Elementary Lectures to Serve as an Introduction to Psycho- [102]
analysis',[1] but what I had in mind was nothing in the nature of a presentation *in usum Delphini*,[2] which would give you a smooth account with all the difficulties carefully concealed, with the gaps filled in and the doubts glossed over, so that you might believe with an easy mind that

1 [The 'elementary' was dropped from the title of the lectures in their published form. See footnote 2, p. 7 above.]

2 ['For the use of the Dauphin' – an edition of the classics prepared for his son by order of Louis XIV: 'bowdlerized'.]

you had learnt something new. No, for the very reason of your being beginners, I wanted to show you our science as it is, with its unevennesses and roughnesses, its demands and hesitations. For I know that it is the same in all sciences and cannot possibly be otherwise, especially in their beginnings. I know also that ordinarily instruction is at pains to start out by concealing such difficulties and incompletenesses from the learner. But that will not do for psychoanalysis. So I have in fact laid down two premises, one within the other; and if anyone finds the whole thing too laborious and too insecure, or if anyone is accustomed to higher certainties and more elegant deductions, he need go no further with us. I think, however, that he should leave psychological problems entirely alone, for it is to be feared that in this quarter he will find impassable the precise and secure paths which he is prepared to follow. And, for a science which has something to offer, there is no necessity to sue for a hearing and for followers. Its findings are bound to canvass on its behalf and it can wait until these have compelled attention to it.

But for those who would like to persist in the subject, I can point out that my two assumptions are not on a par. The first, that dreams are psychical phenomena, is the premise which we seek to prove by the outcome of our work; the second one has already been proved in another field, and I am merely venturing to bring it over from there to our own problems.

Where, then, in what field, can it be that proof has been found that there is knowledge of which the person concerned nevertheless knows nothing, as we are proposing to assume of dreamers? After all, this would be a strange, surprising fact and one which would alter our view of mental life and which would have no need to hide itself: a fact, incidentally, which cancels itself in its very naming and which nevertheless claims to
[103] be something real – a contradiction in terms. Well, it does not hide itself. It is not its fault if people know nothing about it or do not pay enough attention to it. Any more than we are to blame because judgement is passed on all these psychological problems by people who have kept at a distance from all the observations and experiences which are decisive on the matter.

The proof was found in the field of hypnotic phenomena. When, in 1889, I took part in the extraordinarily impressive demonstrations by Liébeault and Bernheim at Nancy,[1] I witnessed the following experiment among others. If a man was put into a state of somnambulism, was made to experience all kinds of things in a hallucinatory manner, and

1 [Freud returns to this in Vol. 16, p. 245 below.]

was then woken up, he appeared at first to know nothing of what had happened during his hypnotic sleep. Bernheim then asked him straight out to report what had happened to him under hypnosis. The man maintained that he could remember nothing. But Bernheim held out against this, brought urgent pressure to bear on him, insisted that he knew it and must remember it. And, lo and behold! the man grew uncertain, began to reflect, and recalled in a shadowy way one of the experiences that had been suggested to him, and then another piece, and the memory became clearer and clearer and more and more complete, and finally came to light without a break. Since, however, he knew afterwards what had happened and had learnt nothing about it from anyone else in the interval, we are justified in concluding that he had known it earlier as well. It was merely inaccessible to him; he did not know that he knew it and thought he did not know it. That is to say, the position was exactly the same as what we suspected in our dreamer.

I hope you will be surprised that this fact has been established and will ask me: 'Why did you omit to bring this proof forward earlier, in connection with the parapraxes, when we came to the point of attributing to a man who had made a slip of the tongue an intention to say things of which he knew nothing and which he denied [*verleugnete*]? If a person thinks he knows nothing of experiences the memory of which he nevertheless has within him, it is no longer so improbable that he knows nothing of other mental processes within him. This argument would certainly have impressed us, and helped us to understand parapraxes.' Of course I could have brought it forward then, but I reserved it for [104]
another place, where it was more needed. The parapraxes explained themselves in part, and in part left us with a suggestion that, in order to preserve the continuity of the phenomena concerned, it would be wise to assume the existence of mental processes of which the subject knows nothing. In the case of dreams we are compelled to bring in explanations from elsewhere and moreover I expect that in their case you will find it easier to accept my carrying over of the explanations from hypnosis. The state in which a parapraxis occurs is bound to strike you as being the normal one; it has no similarity to the hypnotic state. On the other hand there is an obvious kinship between the hypnotic state and the state of sleep, which is a necessary condition of dreaming. Hypnosis, indeed, is described as an artificial sleep. We tell the person we are hypnotizing to sleep, and the suggestions we make are comparable to the dreams of natural sleep. The psychical situations in the two cases are really analogous. In natural sleep we withdraw our interest from the whole external

world; and in hypnotic sleep we also withdraw it from the whole world, but with the single exception of the person who has hypnotized us and with whom we remain in rapport. Incidentally, the sleep of a nursing mother, who remains in rapport with her child and can be woken only by him, is a normal counterpart of hypnotic sleep. So it scarcely seems a very bold venture to transpose a situation from hypnosis to natural sleep. The assumption that in a dreamer too a knowledge about his dreams is present, though it is inaccessible to him so that he himself does not believe it, is not something entirely out of the blue. It should be noticed, moreover, that a third line of approach to the study of dreams is opened at this point: from the stimuli which disturb sleep, from daydreams, and now in addition from the suggested dreams of the hypnotic state.

We may now go back to our task with increased confidence perhaps. It is very probable, then, that the dreamer knows about his dream; the only question is how to make it possible for him to discover his knowledge and communicate it to us. We do not require him to tell us straight away the sense of his dream, but he will be able to find its origin, the circle of
[105] thoughts and interests from which it sprang. You will recall that in the case of the parapraxis the man was asked how he had arrived at the wrong word '*Vorschwein*' and the first thing that occurred to him[1] gave us the explanation. Our technique with dreams, then, is a very simple one, copied from this example. We shall once more ask the dreamer how he arrived at the dream, and once more his first remark is to be looked on as an explanation. Thus we disregard the distinction between his thinking or not thinking that he knows something, and we treat both cases as one and the same.

This technique is certainly very simple, but I fear it will rouse your liveliest opposition. You will say: 'A fresh assumption! the third! And the most unlikely of all! If I ask the dreamer what occurs to him in connection with the dream, is precisely the first thing that occurs to him going to bring the explanation we are hoping for? But nothing at all may occur to him, or heaven knows what may occur to him. I cannot see what an expectation of that kind is based on. That is really showing too much trust in Providence at a point where rather more exercise of the critical faculty would be appropriate. Besides, a dream is not a single wrong word; it consists of a number of elements. So which association are we to take up?'

You are correct on all your minor points. A dream differs from a slip of

1 [See footnote, p. 42 f. above.]

the tongue, among other things, in the multiplicity of its elements. Our technique must take this into account. I therefore suggest to you that we should divide the dream into its elements and start a separate enquiry into each element; if we do this, the analogy with a slip of the tongue is re-established. You are also right in thinking that when the dreamer is questioned about the separate elements of the dream he may reply that nothing occurs to him. There are some instances in which we let this reply pass, and you will later hear which these are [cf. p. 130 below]; strangely enough, they are instances in which definite ideas may occur to us ourselves. But in general if the dreamer asserts that nothing occurs to him we contradict him; we bring urgent pressure to bear on him, we insist that something must occur to him – and we turn out to be right. He will produce an idea – some idea, it is a matter of indifference to us which. He will give us certain pieces of information, which may be [106]
described as 'historical', with particular ease. He may say: 'That's something that happened yesterday' (as was the case in our two 'matter-of-fact' dreams [p. 85 above]), or: 'That reminds me of something that happened a short time ago' – and we shall discover in this way that dreams are connected with impressions of the last day or two much more often than we thought to begin with [loc. cit.]. And finally he will also recall, starting from the dream, events from further back and even perhaps from the far-distant past.

But on your main point you are wrong. If you think it is arbitrary to assume that the first thing that occurs to the dreamer is bound to bring what we are looking for or to lead us to it, if you think that what occurs to him might be anything in the world and might have no connection with what we are looking for, and that it is only exhibiting my trust in Providence if I expect something different – then you are making a great mistake. Once before [p. 43 above] I ventured to tell you that you nourish a deeply rooted faith in undetermined psychical events and in free will, but that this is quite unscientific and must yield to the demand of a determinism whose rule extends over mental life. I beg you to respect it as a fact that *that* is what occurred to the man when he was questioned and nothing else. But I am not opposing one faith with another. It can be proved that the idea produced by the man was not arbitrary nor indeterminable nor unconnected with what we were looking for. Indeed, not long ago I learnt – without, I may say, attaching too much importance to the fact – that experimental psychology too had brought up evidence to that effect.[1]

1 [A footnote dealing with this was added by Freud in 1919 to *I. of D.*, **4**, 160–1 *n.* 2.]

In view of the importance of the matter, I will ask for your special attention. If I ask someone to tell me what occurs to him in response to a particular element of a dream, I am asking him to surrender himself to free association [*freien Assoziation*] *while keeping an idea in mind as a starting point*. This calls for a special attitude of the attention which is quite different from reflection and which excludes reflection. Some people achieve this attitude with ease; others show an incredibly high degree of clumsiness when they attempt it. There is, however, a higher
[107] degree of freedom of association: that is to say, I may drop the insistence on keeping an initial idea in mind and only lay down the sort or kind of association I want – I may, for instance, require the experimenter to allow a proper name or a number to occur to him freely. What then occurs to him would presumably be even more arbitrary and more indeterminable than with our own technique. It can be shown, however, that it is always strictly determined by important internal attitudes of mind which are not known to us at the moment at which they operate – which are as little known to us as the disturbing purposes of parapraxes and the provoking ones of chance actions [p. 54 above].

I and many others after me have repeatedly made such experiments with names and numbers thought of at random, and a few of these have been published.[1] Here the procedure is to produce a series of associations to the name which has emerged; these latter associations are accordingly no longer completely free but have a link, like the associations to the elements of dreams. One continues doing this until one finds the impulse exhausted. But by then light will have been thrown both on the motive and the meaning of the random choice of the name. These experiments always lead to the same result; reports on them often cover a wealth of material and call for extensive expositions. The associations to *numbers* chosen at random are perhaps the most convincing; they run off so quickly and proceed with such incredible certainty to a hidden goal that the effect is really staggering. I will give you only one example of an analysis like this of a name, since dealing with it calls for a conveniently small amount of material.

In the course of treating a young man I had occasion to discuss this topic, and mentioned the thesis that, in spite of an apparently arbitrary choice, it is impossible to think of a name at random which does not turn out to be closely determined by the immediate circumstances, the characteristics of the subject of the experiment and his situation at the

1 [Several examples are given in Section A of Chapter XII of *PEL*, 207 ff., where the whole topic is discussed at length.]

moment. Since he was sceptical, I suggested that he should make an experiment of the kind himself on the spot. I knew that he carried on particularly numerous relationships of every kind with married women and girls, so I thought he would have a specially large choice open to him [108]
if it were to be a woman's name that he was asked to choose. He agreed to this. To my astonishment, or rather, perhaps, to his, no avalanche of women's names broke over me; he remained silent for a moment and then admitted that only a single name had come into his head and none other besides: 'Albine'. – How curious! But what does that name mean to you? How many 'Albines' do you know? – Strange to say, he knew no-one called 'Albine' and nothing further occurred to him in response to the name. So it might be thought that the analysis had failed. But not at all: it was already complete, and no further associations were needed. The man had an unusually fair complexion and in conversation during the treatment I had often jokingly called him an albino. We were engaged at the time in determining the feminine part of his constitution. So it was he himself who was this 'Albine', the woman who was the most interesting to him at the moment.

In the same way tunes that come into one's head without warning turn out to be determined by and to belong to a train of thought which has a right to occupy one's mind though without one's being aware of its activity. It is easy to show then that the relation to the tune is based on its text or its origin. But I must be careful not to extend this assertion to really musical people, of whom, as it happens, I have had no experience. It may be that for such people the musical content of the tune is what decides its emergence. The earlier case is certainly the commoner one. I know of a young man, for instance, who was positively persecuted for a time by the tune (incidentally a charming one) of Paris's song in [Offenbach's] *La belle Hélène*, till his analysis drew his attention to a contemporary competition in his interest between an 'Ida' and a 'Helen'.[1]

If then things that occur to one quite freely are determined in this way and form parts of a connected whole, we shall no doubt be justified in concluding that things that occur to one with a single link – namely their link with the idea which serves as their starting point – cannot be any less determined. Investigation shows, in fact, that, apart from the link we have given them with the initial idea, they are found to be dependent as [109]
well on groups of strongly emotional thoughts and interests, 'complexes',

1 [Paris, who eloped with Helen, was at one time a shepherd on Mount Ida, where he delivered his judgement between three competing goddesses.]

whose participation is not known at the moment – that is to say, is unconscious.

The occurrence of ideas with links of this kind has been the subject of very instructive experimental researches, which have played a notable part in the history of psychoanalysis. The school of Wundt had introduced what are known as association experiments, in which a *stimulus word* is called out to the subject and he has the task of replying to it as quickly as possible with any *reaction* that occurs to him. It is then possible to study the interval that passes between the stimulus and the reaction, the nature of the answer given as a reaction, possible errors when the same experiment is repeated later, and so on. The Zürich school, led by Bleuler and Jung, found the explanation of the reactions that followed in the association experiment by getting the subjects to throw light on their reactions by means of subsequent [*nachträgliche*] associations, if those reactions had shown striking features. It then turned out that these striking reactions were determined in the most definite fashion by the subject's complexes. In this manner Bleuler and Jung built the first bridge from experimental psychology to psychoanalysis.

Having learnt thus much, you will be able to say: 'We acknowledge now that thoughts that occur to one freely are determined and not arbitrary as we supposed. We admit that this is also true of thoughts occurring in response to the elements of dreams. But that is not what we are concerned with. You assert that what occurs to the dreamer in response to the dream element will be determined by the psychical background (unknown to us) of that particular element. This does not seem to us to be proved. We quite expect that what occurs to the dreamer in response to the dream element will turn out to be determined by one of the dreamer's complexes, but what good does that do us? This does not lead us to an understanding of dreams but, like the association experiment, to a knowledge of these so-called complexes. But what have they got to do with dreams?'

You are right, but you are overlooking one factor. Moreover, it is pre-
[110] cisely the factor on account of which I did not choose the association experiment as the starting point of this exposition. In that experiment the single determinant of the reaction – that is, the stimulus word – is arbitrarily chosen by us. The reaction is in that case an intermediary between the stimulus word and the complex which has been aroused in the subject. In dreams the stimulus word is replaced by something that is

itself derived from the dreamer's mental life, from sources unknown to him, and may therefore very easily itself be a 'derivative of a complex'. It is therefore not precisely fantastic to suppose that the further associations linked to the dream elements will be determined by the same complex as that of the element itself and will lead to its discovery.

Let me show you from another instance that the facts are as we expect. The forgetting of proper names is actually an excellent model of what happens in dream analysis; the difference is only that events that are shared between two people in dream analysis are combined in a single person in the parapraxis. If I forget a name temporarily, I nevertheless feel in myself a certainty that I know it – a certainty which in the case of the dreamer we only arrived at by the roundabout path of the Bernheim experiment [p. 90 f. above]. The name which I have forgotten but which I know is, however, not accessible to me. Experience soon teaches me that thinking about it, with however much effort, is of no help. But in place of the forgotten name I can always call up one or several substitute names. It is only after a substitute name of this kind has occurred to me spontaneously that the conformity of this situation with that of dream interpretation becomes obvious. Like this substitute name, the dream element is not the right thing, but only takes the place of something else – of the genuine thing which I do not know and which I am to discover by means of the dream analysis. The difference is once more only that, in the case of forgetting the name, I recognize the substitute unhesitatingly as something ungenuine, whereas we had to acquire this view laboriously in the case of the dream element. Now in the case of forgetting a name there is also a method by which we can start from the substitute and arrive at the unconscious genuine thing, the forgotten name. If I direct my attention to the substitute names and allow further ideas in response to them to occur to me, I arrive by shorter or longer detours at the forgotten name, and I find when this happens that both the spontaneous substitute name and the ones that I have called up are connected with the forgotten one and were determined by it. [111]

I will describe an analysis of this kind to you. I noticed one day that I could not recall the name of the small country on the Riviera, of which Monte Carlo is the chief town. It was very tiresome, but so it was. I summoned up all that I knew about that country. I thought of Prince Albert of the House of Lusignan, of his marriages, of his devotion to deep-sea researches, and everything else I could bring together, but it was of no avail. So I gave up reflection and allowed substitute names to occur to me instead of the lost one. They came rapidly: Monte Carlo itself, then

Piedmont, Albania, Montevideo, Colico. Of this series I was struck first by Albania, which was at once replaced by Montenegro, no doubt because of the contrast between white and black.[1] I then saw that four of these substitute names contained the same syllable 'mon', then suddenly I had the forgotten word and exclaimed aloud: 'Monaco!' So the substitute names had in fact arisen from the forgotten one: the first four came from its first syllable while the last reproduced its syllabic structure and its whole last syllable. Moreover, I was able to discover quite easily what it was that had temporarily deprived me of the name. Monaco is also the Italian name for Munich; and it was that town which exerted the inhibitory influence.[2]

No doubt this example is a good one, but it is too simple. In other cases it would have been necessary to call up a longer string of ideas in response to the first substitute name, and then the analogy with dream analysis would have been clearer. I have had experiences of that sort too. On one occasion a stranger had invited me to drink some Italian wine with him, but when we were in the inn it turned out that he had forgotten the name of the wine which he intended to order because of his very agreeable recollections of it. From a quantity of substitute ideas of different kinds which came into his head in place of the forgotten name, I was able to infer that thoughts about someone called Hedwig had made him forget the name. And he not only confirmed the fact that he had first tasted this
[112] wine when he was with someone of that name, but with the help of this discovery he recalled the name of the wine. He was happily married at the present time and this Hedwig belonged to earlier days which he had no wish to remember.

But if it is possible in the case of forgetting a name, it must also be possible in interpreting dreams to proceed from the substitute along the chain of associations attached to it and so to obtain access to the genuine thing which is being held back. From the example of the forgotten name we may conclude that the associations to the dream element will be determined both by the dream element and also by the unconscious genuine thing behind it. In this way, then, we seem to have produced some justification of our technique.

1 ['*Albus*', the Latin for 'white', and '*negro*', the Spanish or Portuguese for 'black'.]

2 [This episode is described more briefly in *PEL*, 48.]

LECTURE VII

THE MANIFEST CONTENT OF DREAMS AND THE LATENT DREAM THOUGHTS

Ladies and Gentlemen, as you see, our study of parapraxes has not been [113]
unprofitable. Thanks to our labours over them we have, subject to the premises I have explained to you,[1] achieved two things: a conception of the nature of dream elements and a technique for interpreting dreams. The conception of dream elements tells us that they are ungenuine things [p. 97 above], substitutes for something else that is unknown to the dreamer (like the purpose of a parapraxis), substitutes for something the knowledge of which is present in the dreamer but which is inaccessible to him. We are in hopes that it will be possible to carry over the same conception to whole dreams, which are made up of such elements. Our technique lies in employing free association [*freie Assoziation*] to these elements in order to bring about the emergence of other substitutive structures, which will enable us to arrive at what is concealed from view.

I now propose that we should introduce a change into our nomenclature which will give us more freedom of movement. Instead of speaking of 'concealed', 'inaccessible' or 'ungenuine',[2] let us adopt the correct description and say 'inaccessible to the dreamer's consciousness' or '*unconscious*'.[3] I mean nothing else by this than what may be suggested to you when you think of a word that has escaped you or the disturbing purpose in a parapraxis – that is to say, I mean nothing else than '*unconscious at the moment*'. In contrast to this, we can of course speak of the dream elements themselves, and the substitutive ideas that have been newly arrived at from them by association, as '*conscious*'. This nomenclature so far involves no theoretical construction. No objection can [114]
be made to using the word 'unconscious' as an apt and easily understandable description.

1 [See pp. 88 and 89 above.]

2 ['*Uneigentlich*' in all the German editions. The sense would seem to require '*eigentlich* (genuine)'.]

3 [Cf. Lecture I, p. 20 f. above; the discussion is continued below in Lecture XIII, p. 184.]

If we carry over our conception of the separate elements to the whole dream, it follows that the dream as a whole is a distorted substitute for something else, something unconscious, and that the task of interpreting a dream is to discover this unconscious material. From this, however, there at once follow three important rules, which we must obey during the work of interpreting dreams.

(1) We must not concern ourselves with what the dream *appears* to tell us, whether it is intelligible or absurd, clear or confused, since it cannot possibly be the unconscious material we are in search of. (An obvious limitation to this rule will force itself on our notice later [p. 110 below].) (2) We must restrict our work to calling up the substitutive ideas for each element, we must not reflect about them, or consider whether they contain anything relevant, and we must not trouble ourselves with how far they diverge from the dream element. (3) We must wait till the concealed unconscious material we are in search of emerges of its own accord, exactly as the forgotten word 'Monaco' did in the experiment I have described [p. 97 f. above].

Now, too, we can understand to what extent it is a matter of indifference how much or how little the dream is remembered and, above all, how accurately or how uncertainly. For the remembered dream is not the genuine material but a distorted substitute for it, which should assist us, by calling up other substitutive images [*Ersatzbildungen*], to come nearer to the genuine material, to make what is unconscious in the dream conscious. If our memory has been inaccurate, therefore, it has merely made a further distortion of this substitute – a distortion, moreover, which cannot have been without a reason.

The work of interpreting can be performed on one's own dreams just as on other people's. In fact one learns more from one's own: the process carries more conviction. If, then, we make the attempt, we notice that something is opposing our work. It is true that ideas occur to us, but we do not allow all of them to count; testing and selecting influences make themselves felt. In the case of one idea we may say to ourselves: 'No, this
[115] is not relevant, it does not belong here'; in the case of another: 'this is too senseless' and of a third: 'this is totally unimportant'. And we can further observe how with objections of this sort we may smother ideas and finally expel them altogether, even before they have become quite clear. Thus on the one hand we keep too close to the idea which was our starting point, the dream element itself; and on the other hand we interfere with the outcome of the free associations by making a selection. If we are not by ourselves while interpreting the dream, if we get someone

else to interpret it, we become very clearly aware of yet another motive which we employ in making this illicit selection, for sometimes we say to ourselves: 'No, this idea [*Einfall*] is too disagreeable; I will not or cannot report it.'

These objections are obviously a threat to the success of our work. We must guard against them, and in our own case we do so by firmly resolving not to give way to them. If we are analysing someone else's dream, we do so by laying it down as an inviolable rule that he must not hold back any idea from us, even if it gives rise to one of the four objections – of being too unimportant or too senseless or of being irrelevant or too distressing to be reported.[1] The dreamer promises to obey the rule, and we may be annoyed afterwards to find how badly he keeps his promise when the occasion arises. We may explain this to ourselves to begin with by supposing that, in spite of our authoritative assurance, he has not yet realized the justification for free association, and we may perhaps have the notion of first convincing him theoretically by giving him books to read or by sending him to lectures which may convert him into a supporter of our views on free association. But we shall be held back from blunders like this when we consider that in the case of ourselves, as to the strength of whose convictions we can, after all, hardly be in doubt, the same objections arise to certain ideas and are set aside only subsequently [*nachträglich*] – by a court of appeal, as it were.

Instead of being annoyed by the dreamer's disobedience, we may take advantage of these experiences by learning something new from them – something which is all the more important the less we are expecting it. [116] We perceive that the work of interpreting dreams is carried out in the face of a *resistance*, which opposes it and of which the critical objections are manifestations.[2] This resistance is independent of the dreamer's theoretical conviction. We learn still more, indeed. We discover that a critical objection of this kind never turns out to be justified. On the contrary, the ideas which people try to suppress in this way turn out *invariably* to be the most important ones and those which are decisive in our search for the unconscious material. It amounts, in fact, to a special distinguishing mark, if an idea is accompanied by an objection like this.

This resistance is something entirely new: a phenomenon which we have come upon in connection with our premises [p. 89 f. above], but one which was not included among them. The appearance of this new factor

1 [Freud returns to this 'fundamental technical rule of analysis' in Lecture XIX, Vol. 16, p. 254 below, where an Editors' footnote gives further references.]

2 [The subject of 'resistance' is fully dealt with in Lecture XIX, Vol. 16, p. 253 ff. below.]

in our reckoning comes to us as a not altogether pleasant surprise. We suspect at once that it is not going to make our work any easier. It might mislead us into abandoning our whole concern with dreams: something so unimportant as a dream and, on top of that, all these difficulties instead of a simple straightforward technique! But, on the other hand, the difficulties might act precisely as a stimulus and make us suspect that the work will be worth the trouble. We regularly come up against resistance when we try to make our way forward from the substitute which is the dream element to the unconscious material hidden behind it. So we may conclude that there must be something of importance concealed behind the substitute. Otherwise, what is the point of the difficulties that are trying to keep the concealment going? If a child refuses to open his clenched fist to show what he has in it, we may feel sure that it is something wrong – something he ought not to have.

The moment we introduce the dynamic idea of a resistance into the facts of the case, we must simultaneously reflect that this factor is something variable in quantity. There may be greater and smaller resistances, and we are prepared to find these differences showing themselves during our work as well. We may perhaps be able to link with this another experience we also meet with during the work of interpreting dreams:
[117] sometimes it requires only a single response, or no more than a few, to lead us from a dream element to the unconscious material behind it, while on other occasions long chains of associations and the overcoming of many critical objections are required for bringing this about. We shall conclude that these differences relate to the changing magnitude of the resistance, and we shall probably turn out to be right.[1] If the resistance is small, the substitute cannot be far distant from the unconscious material; but a greater resistance means that the unconscious material will be greatly distorted and that the path will be a long one from the substitute back to the unconscious material.

And now perhaps it is time to take a dream and try our technique upon it and see whether our expectations are confirmed. Yes, but what dream are we to choose for the purpose? You cannot imagine how hard I find it to decide; nor can I yet make the nature of my difficulties plain to you. There must obviously be dreams which have on the whole been subjected to only a little distortion, and the best plan would be to begin

1 [Freud discussed the effects on dream interpretation of a high or low pressure of resistance in Section II of his 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), *RSE*, **19**, 100.]

with them. But what dreams have been least distorted? The ones that are intelligible and not confused, two examples of which I have already put before you [p. 85 above]? That would be leading us quite astray. Investigation shows that such dreams have been subjected to an extraordinarily high degree of distortion. If, however, I were to disregard particular requirements and were to select a dream at haphazard, you would probably be greatly disappointed. We might have to notice or record such a profusion of ideas in response to the separate dream elements that we should be unable to make head or tail of the work. If we write down a dream and then make a note of all the ideas that emerge in response to it, these may prove to be many times longer than the text of the dream. The best plan would therefore seem to be to choose a number of short dreams for analysis, each of which will at least tell us something or confirm some point. So we will make up our minds to take that course, unless experience may perhaps show us where we can really find dreams that have been only slightly distorted.[1]

I can however think of something else that will make things easier for us – something, moreover, which lies along our path. Instead of starting on the interpretation of *whole* dreams, we will restrict ourselves to a few dream elements, and we will trace out in a number of examples how these can be explained by applying our technique to them. [118]

(*a*) A lady reported that she very often dreamt when she was a child that *God wore a paper cocked hat on his head*. What can you make of that without the dreamer's help? It sounds completely nonsensical. But it ceases to be nonsense when we hear from the lady that she used to have a hat of that sort put on her head at meals when she was a child, because she could never resist taking furtive glances at her brothers' and sisters' plates to see whether they had been given larger helpings than she had. So the hat was intended to act like a pair of blinkers. This, incidentally, was a piece of historical information [p. 93 above] and was given without any difficulty. The interpretation of this element and at the same time of the whole short dream was easily made with the help of a further idea that occurred to the dreamer: 'As I had heard that God was omniscient and saw everything', she said, 'the dream can only mean that I knew everything and saw everything, even though they tried to prevent me.'[2] Perhaps this example is too simple.

1 [See the following lecture.]

2 [This dream is reported in *I of D.*, **5**, 369–70.]

(*b*) A sceptical woman patient had a longish dream in the course of which some people told her about my book on jokes [1905*c*; *RSE*, **8**] and praised it highly. Something came in then about *a 'channel', perhaps it was another book that mentioned a channel, or something else about a channel . . . she didn't know . . . it was all so indistinct.*

No doubt you will be inclined to expect that the element 'channel', since it was so indistinct, would be inaccessible to interpretation. You are right in suspecting a difficulty; but the difficulty did not arise from the indistinctness: both the difficulty and the indistinctness arose from another cause. Nothing occurred to the dreamer in connection with 'channel', and *I* could of course throw no light on it. A little later – it was the next day, in point of fact – she told me that she had thought of
[119] something that *might* have something to do with it. It was a joke, too – a joke she had heard. On the steamer between Dover and Calais a well-known author fell into conversation with an Englishman. The latter had occasion to quote the phrase: 'Du sublime au ridicule il n'y a qu'un pas. [It is only a step from the sublime to the ridiculous.]' 'Yes,' replied the author, '*le Pas de Calais*' – meaning that he thought France sublime and England ridiculous. But the *Pas de Calais* is a channel – the English Channel.[1] You will ask whether I think this had anything to do with the dream. Certainly I think so; and it provides the solution to the puzzling element of the dream. Can you doubt that this joke was already present before the dream occurred, as the unconscious thought behind the element 'channel'? Can you suppose that it was introduced as a subsequent [*nachträglich*] invention? The association betrayed the scepticism which lay concealed behind the patient's ostensible admiration; and her resistance against revealing this was no doubt the common cause both of her delay in producing the association and of the indistinctness of the dream element concerned. Consider the relation of the dream element to its unconscious background: it was, as it were, a fragment of the background, an allusion to it, but it was made quite incomprehensible by being isolated.[2]

(*c*) As part of a longish dream a patient dreamt that *several members of his family were sitting round a table of a peculiar shape*, etc. It occurred to him in connection with the table that he had seen a piece of furniture of the kind when he was on a visit to a particular family. His thoughts

1 [Actually the Straits of Dover.]

2 [The whole of this example (*b*) was inserted by Freud into *I. of D.* as a footnote in 1919 (**5**, 463 *n.* 1).]

then went on to say that there was a peculiar relationship between the father and son in this family; and he soon added that the same thing was true of the relationship between himself and his own father. So the table had been taken into the dream in order to point out this parallel.

This dreamer had been long familiar with the requirement of dream interpretation. Another person might perhaps have taken objection to such a trivial detail as the shape of a table being made the subject of investigation. But in fact we regard nothing in a dream as accidental or indifferent, and we expect to obtain information precisely from the [120] explanation of such trivial and pointless details. You may perhaps also feel surprised that the thought that 'the same thing was true of us and of them' should have been expressed by, in particular, the choice of a table [*Tisch*]. But this too becomes clear when you learn that the name of the family in question was *Tischler* [literally 'carpenter']. By making his relations sit at this *Tisch*, he was saying that they too were *Tischlers*. Incidentally, you will notice how inevitably one is led into being indiscreet when one reports these dream interpretations. And you will guess that this is one of the difficulties I have hinted at over the choice of examples. I could easily have taken another example in place of this one, but I should probably merely have avoided *this* indiscretion at the price of committing another.

The moment seems to me to have arrived for introducing two terms, which we could have made use of long ago. We will describe what the dream actually tells us as the *manifest dream content*, and the concealed material, which we hope to reach by pursuing the ideas that occur to the dreamer, as the *latent dream thoughts*. Thus we are here considering the relations between the manifest content of the dream and the latent dream thoughts as shown in these examples. These relations may be of very many different kinds. In examples (*a*) and (*b*) the manifest element is also a constituent of the latent thoughts, though only a small fragment of them. A small piece of the large and complicated psychical structure of unconscious dream thoughts has made its way into the manifest dream as well – a fragment of them, or, in other cases, an allusion to them, a caption, as it were, or an abbreviation in telegraphic style. It is the business of the work of interpretation to complete these fragments or this allusion into a whole – which was achieved particularly nicely in the case of example (*b*). Thus one form of the distortion which constitutes the dream-work is replacement by a fragment or an allusion. In example (*c*) another kind of relation is to be observed in addition; and

we shall find this expressed in a purer and clearer form in the examples which follow.

(*d*) The dreamer *was pulling a lady* (a particular one, of his acquaintance)
[121] *out from behind a bed*. He himself found the meaning of this dream element from the first idea that occurred to him. It meant that he was giving this lady preference.[1]

(*e*) Another man dreamt that *his brother was in a box* [*Kasten*]. In his first response '*Kasten*' was replaced by '*Schrank* [cupboard]', and the second gave the interpretation: his brother was restricting himself ['*schränkt sich ein*'].[2]

(*f*) The dreamer *climbed to the top of a mountain, which commanded an unusually extensive view*. This sounds quite rational and you might suppose that there is nothing to interpret in it and that all we have to do is to enquire what memory gave rise to the dream and the reason for its being stirred up. But you would be wrong. It turned out that this dream stood in need of interpreting just as much as any other, more confused one. For none of his own mountain climbs occurred to the dreamer, but he thought of the fact that an acquaintance of his was the editor of a 'Survey', dealing with our relations with the most remote parts of the earth. Thus the latent dream thought was an identification of the dreamer with the 'surveyor'.

Here we have a new type of relation between the manifest and latent dream elements. The former is not so much a distortion of the latter as a representation of it, a plastic, concrete, portrayal of it, taking its start from the wording. But precisely on that account it is once more a distortion, for we have long since forgotten from what concrete image the word originated and consequently fail to recognize it when it is replaced by the image. When you consider that the manifest dream is made up predominantly of visual images and more rarely of thoughts and words, you can imagine what importance attaches to this kind of relation in the construction of dreams. You will see, too, that in this way it becomes possible in regard to a large number of abstract thoughts to create pictures to act as substitutes for them in the manifest dream while at the

1 [This example, like the next, depends on a purely verbal point: the resemblance between the German words for 'pulling out' (*hervorziehen*) and 'preferring' (*vorziehen*). From *I. of D.*, **5**, 365.]

2 [This and the next example are from *I. of D.*, **5**, 364.]

same time serving the purpose of concealment. This is the technique of the familiar picture-puzzles. Why it is that these representations have an [122] appearance of being jokes is a special problem into which we need not enter here.[1]

There is a fourth kind of relation between the manifest and latent elements, which I must continue to hold back from you until we come upon its keyword in considering technique.[2] Even so I shall not have given you a full list; but it will serve our purpose.

Do you feel bold enough now to venture upon the interpretation of a *whole* dream? Let us make the experiment, to see whether we are well enough equipped for the task. I shall of course not select one of the most obscure ones; nevertheless, it will be one that gives a well-marked picture of the attributes of a dream.[3]

Very well then. A lady who, though she was still young, had been married for many years had the following dream: *She was at the theatre with her husband. One side of the stalls was completely empty. Her husband told her that Elise L. and her fiancé had wanted to go too, but had only been able to get bad seats – three for 1 florin 50 kreuzers – and of course they could not take those. She thought it would not really have done any harm if they had.*

The first thing the dreamer reported to us was that the precipitating cause of the dream was touched on in its manifest content. Her husband had in fact told her that Elise L., who was approximately her contemporary, had just become engaged. The dream was a reaction to this information. We know already [p. 93 above] that it is easy in the case of many dreams to point to a precipitating cause like this from the previous day, and that the dreamer is often able to trace this for us without any difficulty. The dreamer in the present case put similar information at our [123] disposal for other elements of the manifest dream as well. – Where did the detail come from about one side of the stalls being empty? It was an allusion to a real event of the previous week. She had planned to go to a particular play and had therefore bought her tickets *early* – so early that she had had to pay a booking fee. When they got to the theatre it turned

1 [See the discussion of the point in Chapter VI of Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 150 f.; cf. also p. 205 f. below.]

2 [See below, p. 131 f.]

3 [The dream which follows had been analysed, but very much less elaborately, in *I. of D.*, **5**, 371–2. It is also discussed in Chapters VII and VIII of the short work *On Dreams* (1901*a*), *RSE*, **5**, 603 and 606. Freud returns to it in these lectures at several points: pp. 122, 155, 192–3 and 196–7 below.]

out that her anxiety was quite uncalled for, since *one side of the stalls was almost empty*. It would have been early enough if she had bought the tickets on the actual day of the performance. Her husband had kept on teasing her for having been in too much of a hurry. – What was the origin of the 1 florin 50 kreuzers? It arose in quite another connection, which had nothing to do with the former one but also alluded to some information from the previous day. Her sister-in-law had been given a present of 150 florins by her husband and had been in a great hurry – the silly goose – to rush off to the jewellers' and exchange the money for a piece of jewellery. – Where did the 'three' come from? She could think of nothing in connection with that, unless we counted the idea that her newly engaged friend, Elise L., was only three months her junior, though she herself had been a married woman for nearly ten years. – And the absurd notion of taking three tickets for only two people? She had nothing to say to that, and refused to report any further ideas or information.

But all the same, she had given us so much material in these few associations that it was possible to guess the latent dream thoughts from them. We cannot help being struck by the fact that periods of time occur at several points in the information she gave us about the dream, and these provide a common factor between the different parts of the material. She took the theatre tickets *too early*, bought them *overhurriedly* so that she had to pay more than was necessary; so too her sister-in-law had been *in a hurry* to take her money to the jewellers' and buy some jewellery with it, as though otherwise she would *miss it*. If, in addition to the 'too early' and 'in a hurry' which we have stressed, we take into account the precipitating cause of the dream – the news that her friend, though only three months *her junior*, had nevertheless got an excellent husband – and the criticism of her sister-in-law expressed in the idea that it was *absurd* of her
[124] to be in such a hurry, then we find ourselves presented almost spontaneously with the following construction of the latent dream thoughts, for which the manifest dream is a severely distorted substitute:

'Really it was *absurd* of me to be in such a hurry to get married! I can see from Elise's example that *I* could have got a husband later too.' (Being in too great a hurry was represented by her own behaviour in buying the tickets and by her sister-in-law's in buying the jewellery. Going to the play appeared as a substitute for getting married.) This would seem to be the main thought. We may perhaps proceed further, though with less certainty, since the analysis ought not to have been without the dreamer's comments at these points: 'And I could have got one a hundred times better with the money!' (150 florins is a hundred

times more than 1 florin 50.) If we were to put her dowry in place of the money, it would mean that her husband was bought with her dowry: the jewellery, and the bad tickets as well, would be substitutes for her husband. It would be still more satisfactory if the actual element 'three tickets' had something to do with a husband. [Cf. below, p. 192.] But we have not got so far as that in our understanding of the dream. We have only discovered that the dream expresses the *low value* assigned by her to her own husband and her regret at having *married so early*.

We shall, I fancy, be more surprised and confused than satisfied by the outcome of this first dream interpretation. We have been given too much in one dose – more than we are yet able to cope with. We can already see that we shall not exhaust the lessons of this interpretation of a dream. Let us hasten to single out what we can recognize as established new discoveries.

In the first place, it is a remarkable thing that the main emphasis in the latent thoughts lies on the element of being in too great a hurry; nothing of the sort is to be found in the manifest dream. Without the analysis, we should have had no suspicion that that factor plays any part. It seems, therefore, to be possible for what is in fact the main thing, the centre of the unconscious thoughts, to be absent in the manifest dream. This means that the impression made by the whole dream must be fundamentally altered. In the second place, there is an absurd combination in the dream: three for 1 florin 50. We detected in the dream thoughts the assertion that 'it was absurd (to marry so early)'. Can it be doubted that [125]
this thought, 'it was absurd', is represented by the inclusion of an absurd element in the manifest dream? And in the third place, a glance of comparison shows us that the relation between the manifest and latent elements is no simple one; it is far from being the case that one manifest element always takes the place of one latent one. It is rather that there is a group relation between the two layers, within which one manifest element can replace several latent ones or one latent element can be replaced with several manifest ones. [Cf. below, p. 151.]

As regards the meaning of the dream and the dreamer's attitude to it, we might point out much that is similarly surprising. She agreed to the interpretation indeed, but she was astonished at it. She was not aware that she assigned such a low value to her husband; nor did she know *why* she should set such a low value on him. So there is still much that is unintelligible about it. It really seems to me that we are not yet equipped for interpreting a dream and that we need first to be given some further instruction and preparation.

LECTURE VIII

CHILDREN'S DREAMS

[126] Ladies and Gentlemen, I am under the impression that we have advanced too quickly. Let us go back a little. Before we made our last attempt at overcoming the difficulty of distortion in dreams by the help of our technique, we were saying [p. 102 f. above] that our best plan would be to get round the difficulty by keeping to dreams in which there was no distortion or only a very little – if such dreams exist. This will once more mean a divergence from the historical development of our discoveries [cf. p. 73]; for actually it was only after the technique of interpretation had been consistently applied and distorted dreams had been completely analysed that the existence of dreams that are free from distortion came to our notice.

The dreams we are in search of occur in children.[1] They are short, clear, coherent, easy to understand and unambiguous; but they are nevertheless undoubtedly dreams. You must not suppose, however, that all children's dreams are of this kind. Dream distortion sets in very early in childhood, and dreams dreamt by children of between five and eight have been reported which bear all the characteristics of later ones. But if you limit yourselves to ages between the beginning of observable mental activity and the fourth or fifth year, you will come upon a number of dreams which possess the characteristics that can be described as 'infantile' and you will find a few of the same kind in later years of childhood. Indeed, under certain conditions even adults have dreams which are quite similar to the typically infantile ones.

From these children's dreams we can draw conclusions with great ease and certainty on the essential nature of dreams in general, and we can hope that those conclusions will prove decisive and universally valid.

[127] (1) No analysis, no application of any technique is necessary in order to understand these dreams. There is no need to question a child who tells us his dream. One has, however, to add a piece of information to it from

1 [There is no separate chapter on children's dreams in *I. of D.*, but they are dealt with in Chapter III, **4**, 113 ff., where the examples in the present lecture can be found again.]

the events of the child's life. There is invariably some experience of the previous day which explains the dream to us. The dream is the reaction of the child's mental life in his sleep to this experience of the previous day.

We will take a few examples on which to base our further conclusions.

(*a*) A boy of 22 months was told to hand over a basket of cherries to someone as a birthday present. He was obviously very unwilling to do it, although he was promised that he should have a few of them for himself. Next morning he reported having dreamt: '*Hermann eaten all the chewwies!*'

(*b*) A girl of 3¼ years was taken across the lake for the first time. At the landing stage she did not want to leave the boat and wept bitterly. The crossing had been too short for her. Next morning she announced: '*Last night I went on the lake.*' We may safely add that this crossing had lasted longer.

(*c*) A boy of 5¼ years was taken on an excursion up the Echerntal near Hallstatt.[1] He had been told that Hallstatt was at the foot of the Dachstein. He had shown great interest in this mountain. There was a fine view of it from where he was staying at Aussee, and the Simony Hut on it could be made out through a telescope. The child had often tried to see it through the telescope – with what success was not known. The excursion began in an atmosphere of cheerful expectation. Whenever a fresh mountain came into view the boy asked: 'Is that the Dachstein?' and he became more and more depressed the more often he was told it was not. Finally he fell completely silent and refused to go with the rest of the party up the short ascent to the waterfall, and it was thought that he must be overtired. But next morning he said with a radiant face: 'Last night I dreamt *we were at the Simony Hut*.' So that had been what he expected to do on the excursion. He gave no further details except something he had heard before: 'You have to climb up steps for six hours.'

These three dreams will give us all the information we require.

(2) As we can see, these children's dreams are not senseless. They are intelligible, completely valid mental acts. You will recall what I told you [128]
of the medical view of dreams and of the analogy with unmusical fingers wandering over the keys of a piano [p. 76 above]. You cannot fail to observe how sharply these children's dreams contradict this view. It would really be too strange if *children* could perform complete mental

1 [In the Salzkammergut district of Upper Austria.]

functions in their sleep while *adults* were content under the same conditions with reactions which were no more than 'twitchings'. Moreover, we have every reason to think that children's sleep is sounder and deeper.

(3) These dreams are without any dream distortion, and therefore call for no interpretative activity. Here the manifest and the latent dream coincide. *Thus dream distortion is not part of the essential nature of dreams.* I expect this will be a weight off your minds. But when we examine these dreams more closely, we shall recognize a small piece of dream distortion even in them, a certain distinction between the manifest content of the dream and the latent dream thoughts.

(4) A child's dream is a reaction to an experience of the previous day, which has left behind it a regret, a longing, a wish that has not been dealt with. *The dream produces a direct, undisguised fulfilment of that wish.* Let us recall now our discussions on the part played by somatic stimuli from outside and from within as disturbers of sleep and instigators of dreams [p. 80 ff. above]. In that connection we came to know some quite undoubted facts, but by their means we were able to explain only a small number of dreams. In these children's dreams, however, there is nothing that points to the operation of somatic stimuli of that kind; we could not be mistaken in this, for the dreams are completely intelligible and easy to grasp. But this does not mean that we need abandon the stimulus aetiology of dreams. We can only ask how it has happened that from the first we have forgotten that besides somatic stimuli there are *mental* stimuli that disturb sleep. We know, after all, that it is excitations of this kind that are chiefly responsible for disturbing the sleep of an adult by preventing him from establishing the mood required for falling asleep – the withdrawing of interest from the world. He does not want to interrupt his life but would rather continue his work on the things he is concerned with, and for that reason he does not fall asleep. In the case of children, therefore, the stimulus that disturbs sleep is a mental one – the wish that has
[129] not been dealt with – and it is to this that they react with the dream.

(5) This gives us the most direct approach to understanding the function of dreams. Insofar as a dream is a reaction to a psychical stimulus, it must be equivalent to dealing with the stimulus in such a way that it is got rid of and that sleep can continue. We do not yet know how this dealing with the stimulus by the dream is made possible dynamically, but we see already that *dreams are not disturbers of sleep*, as they are abusively called, but *guardians of sleep which get rid of disturbances of sleep*. We think we should have slept more soundly if there had been no dream, but we are wrong; in fact, without the help of the dream we should not have

slept at all. It is due to it that we have slept as soundly as we have. It could not avoid disturbing us a little, just as the night-watchman often cannot help making a little noise while he chases away the disturbers of the peace who seek to waken us with their noise.

(6) What instigates a dream is a wish, and the fulfilment of that wish is the content of the dream – this is one of the chief characteristics of dreams. The other, equally constant one is that a dream does not simply give expression to a thought, but represents the wish fulfilled as a hallucinatory experience.[1] '*I should like to go on the lake*' is the wish that instigates the dream. The content of the dream itself is: '*I am going on the lake.*' Thus even in these simple children's dreams a difference remains between the latent and the manifest dream, there is a distortion of the latent dream thought: *the transformation of a thought into an experience*. In the process of interpreting a dream this alteration must first be undone. If this turns out to be the most universal characteristic of dreams, the fragment of dream which I reported to you earlier [p. 106 above] 'I saw my brother in a box [*Kasten*]' is not to be translated 'my brother is restricting himself [*schränkt sich ein*]' but 'I should like my brother to restrict himself: *my brother must restrict himself*.' Of the two general characteristics of dreams which I have here brought forward, the second clearly has more prospect of being accepted without contradiction than the first. It is only by means of far-reaching investigations that we shall be able to establish the fact that what instigates dreams must always be a wish and cannot be a worry or an intention or a reproach; but this will not affect the other characteristic – that the dream does not simply reproduce this stimulus, but removes it, gets rid of it, deals with it, by means of a kind of experience. [130]

(7) On the basis of these characteristics of dreams, we can return once more to a comparison between a dream and a parapraxis. In the latter we distinguished between a disturbing purpose and a disturbed one [p. 54 ff. above], and the parapraxis was a compromise between them. A dream can be fitted into the same pattern. The disturbed purpose can only be that of sleeping. We may replace the disturbing one with the psychical stimulus, or let us say with the wish which presses to be dealt with, since we have not learnt so far of any other psychical stimulus that disturbs sleep. Here the dream, too, is the result of a compromise. One sleeps, but one nevertheless experiences the removing of a wish; one

1 [It will be noted that the two 'chief characteristics' or 'general characteristics of dreams' considered in what follows are not the same as the two things 'common to all dreams' discussed in Lecture V, p. 77 ff. above.]

satisfies a wish, but at the same time one continues to sleep. Both purposes are partly achieved and partly abandoned.

(8) You will recall that at one point [p. 86 above] we hoped to approach an understanding of the problems of dreams from the fact that certain imaginative structures [*Phantasiebildungen*] which are very transparent to us are known as 'daydreams'. Now these daydreams are in fact wish fulfilments, fulfilments of ambitions and erotic wishes which are well known to us; but they are *thought*, even though vividly imagined, and never experienced as hallucinations. Of the two chief characteristics of dreams, then, the less well assured is preserved here, while the other, since it depends on the state of sleep and cannot be realized in waking life, is entirely absent. Linguistic usage, therefore, has a suspicion of the fact that wish fulfilment is a chief characteristic of dreams. Incidentally, if our experience in dreams is only a modified kind of imagining made possible by the conditions of the state of sleep – that is, a 'nocturnal daydreaming' – we can already understand how the process of constructing a dream can dispose of the nocturnal stimulus and bring satisfaction, since daydreaming too is an activity bound up with satisfaction and is only practised, indeed, on that account.

[131] But other usages of language express the same sense. There are familiar proverbs such as 'Pigs dream of acorns and geese dream of maize' or 'What do hens dream of? – Of millet.'[1] So proverbs go even lower than we do – below children to animals – and assert that the content of dreams is the satisfaction of a need. Numbers of figures of speech seem to point in the same direction: 'lovely as a dream', 'I shouldn't have dreamt of such a thing', 'I haven't imagined it in my wildest dreams'. In this, linguistic usage is evidently taking sides. For there are anxiety dreams as well, and dreams with a distressing or indifferent content; but linguistic usage has been unmoved by them. It is true that it knows of 'bad dreams', but a dream pure and simple is only the sweet fulfilment of a wish. Nor is there any proverb which might tell us that pigs or geese dream of being slaughtered.

It is inconceivable, of course, that the wish-fulfilling characteristic of dreams should not have been noticed by writers on the subject. On the contrary, it has often been noticed; but it has not occurred to any of them to recognize this characteristic as a universal one and to make it into a cornerstone for the explanation of dreams. We can well imagine what it is that has held them back from it and we shall go into the matter later on.

1 [A Hungarian and a Jewish proverb respectively. Cf. *I. of D.*, **4**, 117 and *n.* 2.]

But consider what a large amount of light has been thrown on things by our examination of children's dreams, and with scarcely any effort: the functions of dreams as the guardians of sleep; their origin from two concurrent purposes, one of which, the desire for sleep, remains constant, while the other strives to satisfy a psychical stimulus; proof that dreams are psychical acts with a sense; their two chief characteristics – wish fulfilment and hallucinatory experience. And in discovering all this we were almost able to forget that we were engaged on psychoanalysis. Apart from its connection with parapraxes, our work has carried no specific mark. Any psychologist, knowing nothing of the postulates of psychoanalysis, might have been able to give this explanation of children's dreams. Why have they not done so?

If dreams of the infantile kind were the only ones, the problem would be solved and our task finished, and that without our questioning the [132]
dreamer or bringing in the unconscious or resorting to free association. This is evidently where a continuation of our task lies ahead. We have already found repeatedly that characteristics which were claimed as being of general validity have turned out to apply only to a particular sort and number of dreams. The question for us is therefore whether the general characteristics we inferred from children's dreams have a firmer footing, whether they also hold good of dreams which are not transparently clear and whose manifest content gives no sign of being connected with a wish left over from the previous day. It is our view that these other dreams have undergone a far-reaching distortion and for that reason cannot be judged at first glance. We suspect too that to explain this distortion we shall need the psychoanalytic technique which we have been able to do without in the understanding we have just gained of children's dreams.

In any case, there is yet another class of dreams which are undistorted and, like children's dreams, can easily be recognized as wish fulfilments. These are the dreams which all through life are called up by imperative bodily needs – hunger, thirst, sexual need – that is, they are wish fulfilments as reactions to internal somatic stimuli. Thus I have a note of a dream dreamt by a little girl of nineteen months, which consisted of a *menu*, to which her own name was attached: '*Anna F., stwawbewwies, wild stwawbewwies, omblet, pudden!*' This was a reaction to a day without food, owing to a digestive upset, which had actually been traced back to the fruit which appeared twice in the dream. The little girl's grandmother – their combined ages came to

seventy years – was simultaneously obliged to go without food for a whole day on account of a disturbance due to a floating kidney. She dreamt the same night that she had been 'asked out' and had been served with the most appetizing delicacies.

Observations on prisoners who have been compelled to starve, and on people who have been subjected to privations on travels and explorations, teach us that under these conditions the satisfaction of their needs is regularly dreamt of. Thus Otto Nordenskjöld (1904, **1**, 336 f.) writes as follows of the members of his expedition while they were wintering in the Antarctic: 'The direction taken by our innermost thoughts was very
[133] clearly shown by our dreams, which were never more vivid or numerous than at this time. Even those of us who otherwise dreamt but rarely had long stories to tell in the morning when we exchanged our latest experiences in this world of the imagination. They were all concerned with the outside world which was now so remote from us, though they were often adapted to our actual circumstances. . . . Eating and drinking, however, were the pivot round which our dreams most often revolved. One of us, who had a special gift for attending large luncheon parties during the night, was proud if he was able to report in the morning that he had "got through a three-course dinner". Another of us dreamt of tobacco, of whole mountains of tobacco; while a third dreamt of a ship in full sail coming in across open water. Yet another dream is worth repeating. The postman brought round the mail and gave a long explanation of why we had had to wait so long for it: he had delivered it at the wrong address and had only succeeded in recovering it with great difficulty. We dreamt, of course, of still more impossible things. But there was a most striking lack of imaginativeness shown by almost all the dreams I dreamt myself or heard described. It would certainly be of great psychological interest if all these dreams could be recorded. And it will easily be understood how much we longed for sleep, since it could offer each one of us everything that he most eagerly desired.' So too, according to Du Prel [1885, 231], 'Mungo Park, when he was almost dying of thirst on one of his African journeys, dreamt unceasingly of the well-watered valleys and meadows of his home. Similarly, Baron Trenck, suffering torments of hunger while he was a prisoner in the fortress at Magdeburg, dreamt of being surrounded by sumptuous meals; and George Back, who took part in Franklin's first expedition, when he was almost dying of starvation as a result of his fearful privations, dreamt constantly and regularly of copious meals.'[1]

1 [These two quotations appear in *I. of D.*, **4**, 117 *n.* 1.]

Anyone who has eaten some highly spiced dish at dinner and develops a thirst during the night is very likely to dream that he is drinking.[1] It is of course impossible to get rid of a fairly strong need for food or drink by means of a dream. One wakes up from a dream of this sort still feeling [134]
thirsty, and has to have a drink of real water. The effect produced by the dream is in this instance trivial from the practical point of view; but it is nonetheless clear that it was produced with the aim of protecting one's sleep against a stimulus that was urging one to wake up and take action. When the need is of less intensity dreams of satisfaction often help one to get over it.

In the same way, dreams create satisfactions under the influence of sexual stimuli, but these show peculiarities which deserve mention. Since it is characteristic of the sexual drive [*Sexualtriebs*][T] to be a degree less *Trieb*
dependent on its object than hunger and thirst, the satisfaction in dreams of emission can be a real one; and in consequence of certain difficulties (which I shall have to mention later) in its relation to its object, it happens with special frequency that the real satisfaction is nevertheless attached to a dream content which is obscure or distorted. This characteristic of dreams of emission (as Otto Rank [1912*b*] has pointed out) makes them particularly favourable subjects for the study of dream distortion.[2] Furthermore, all adult dreams arising from bodily needs usually contain, in addition to the satisfaction, other material which is derived from purely psychical sources of stimulation and requires interpretation before it can be understood.

Moreover, I do not mean to assert that the wish-fulfilment dreams of adults which are constructed on infantile lines only appear as reactions to the imperative needs that I have mentioned. We are acquainted as well with short, clear dreams of this sort which, under the influence of some dominant situation, arise out of what are unquestionably psychical sources of stimulation. There are, for instance, dreams of impatience: if someone has made preparations for a journey, for a theatrical performance that is important to him, for going to a lecture or paying a visit, he may dream of a premature fulfilment of his expectation; he may, during the night before the event, see himself arrived at his destination, present at the theatre, in conversation with the person he is going to visit. Or there are what are justly known as dreams of convenience, in which a person who would like to sleep longer dreams that he is already up and is washing, or is already at school, whereas he is really still sleeping and [135]

1 [A detailed analysis of a dream of this kind is given in *I. of D.*, **4**, 110 f.]

2 [This is discussed more fully in *I. of D.*, **5**, 359 f.]

would rather get up in a dream than in reality.[1] The wish to sleep, which we have recognized as regularly playing a part in the construction of dreams, comes into the open in these dreams and reveals itself in them as the essential dream constructor. There is good reason for ranking the need to sleep alongside of the other great bodily needs.

Here is a reproduction of a picture by Schwind in the Schack Gallery in Munich [see facing page], which shows how correctly the artist grasped the way in which dreams arise from the dominant situation. Its title is 'The Prisoner's Dream', a dream whose content is bound to be his escape. It is a happy point that he is to escape through the window, for it is the stimulus of the light pouring in by the window that is putting an end to the prisoner's sleep. The gnomes who are clambering up on one another no doubt represent the successive positions which he himself would have had to take as he climbed up to the level of the window; and, if I am not mistaken and am not attributing too much deliberation to the artist, the topmost of the gnomes, who is sawing through the bars – that is, who is doing what the prisoner would like to do – has the same features as himself.

In all dreams other than children's dreams and those of an infantile type our path is, as I have said, obstructed by dream distortion. We cannot tell, to begin with, whether these other dreams too are wish fulfilments as we suspect, we cannot guess from their manifest content to what psychical stimulus they owe their origin, and we cannot prove that they too are endeavouring to get rid of that stimulus or in some way deal with it. They must be interpreted – that is, translated [*übersetzt*][T] – their distortion must be undone, and their manifest content replaced with their latent one, before we can form a judgement as to whether what we have found in infantile dreams can claim to be valid for all dreams.

LECTURE IX

THE CENSORSHIP OF DREAMS

Ladies and Gentlemen, the study of the dreams of children has taught us [136]
the origin, the essential nature and the function of dreams. *Dreams are things which get rid of (psychical) stimuli disturbing to sleep, by the method of hallucinatory satisfaction*. We have, however, only been able to explain one group of the dreams of adults – those which we have described as dreams of an infantile type. What the facts are about the others we cannot yet say, but we do not understand them. We have arrived at a provisional finding, however, whose importance we must not underestimate. Whenever a dream has been completely intelligible to us, it has turned out to be the hallucinated fulfilment of a wish. This coincidence cannot be a chance one nor a matter of indifference.

We have assumed of dreams of another sort [p. 99 f. above], on the basis of various considerations and on the analogy of our views on parapraxes, that they are a distorted substitute for an unknown content, and that the first thing is to trace them back to it. Our immediate task, then, is an enquiry which will lead to an understanding of this *distortion in dreams*.

Dream distortion is what makes a dream seem strange and unintelligible to us. We want to know a number of things about it: firstly, where it comes from – its dynamics –, secondly, what it does and, lastly, how it does it. We can also say that dream distortion is carried out by the dream-work; and we want to describe the dream-work and trace it back to the forces operating in it.[1]

And now listen to this dream. It was recorded by a lady belonging to our group,[2] and, as she tells us, was derived from a highly esteemed and cultivated elderly lady. No analysis was made of the dream; our informant remarks that for a psychoanalyst it needs no interpreting. Nor did the dreamer herself interpret it, but she judged it and condemned it as though she understood how to interpret it; for she said of it: 'And [137]

1 [The dream-work is discussed in Lecture XI, p. 148 ff. below.]

2 Frau Dr von Hug-Hellmuth [1915].

disgusting, stupid stuff like this was dreamt by a woman of fifty, who has no other thoughts day and night but worry about her child!'[1]

Here, then, is the dream – which deals with 'love services' in wartime.[2] '*She went to Garrison Hospital No. 1 and informed the sentry at the gate that she must speak to the Chief Medical Officer (mentioning a name that was unknown to her) as she wanted to volunteer for service at the hospital. She pronounced the word "service" in such a way that the NCO at once understood that she meant "love service". Since she was an elderly lady, after some hesitation he allowed her to pass. Instead of finding the Chief Medical Officer, however, she reached a large and gloomy apartment in which a number of officers and army doctors were standing and sitting round a long table. She approached a staff surgeon with her request, and he understood her meaning after she had said only a few words. The actual wording of her speech in the dream was: "I and many other women and girls in Vienna are ready to . . ." at this point in the dream her words turned into a mumble ". . . for the troops – officers and other ranks without distinction." She could tell from the expressions on the officers' faces, partly embarrassed and partly sly, that everyone had understood her meaning correctly. The lady went on: "I'm aware that our decision must sound surprising, but we mean it in bitter earnest. No-one asks a soldier in the field whether or not he wishes to die." There followed an awkward silence of some minutes. The staff surgeon then put his arm round her waist and said: "Suppose, madam, it actually came to . . . (mumble)." She drew away from him, thinking to herself: "He's like all the rest of them", and replied: "Good gracious, I'm an old woman and I might never come to that. Besides, there's one condition that must be observed: age must be respected. It must never happen that an elderly woman . . . (mumble) . . . a mere boy. That would be terrible." "I understand perfectly," replied the staff surgeon. Some of the officers, and among them one who had been a suitor of hers in her youth, laughed out loud. The lady then asked to be taken to the Chief Medical Officer, with whom she was*
[138] *acquainted, so that the whole matter could be thrashed out; but she found, to her consternation, that she could not recall his name. Nevertheless, the staff surgeon, most politely and respectfully, showed her the way up to the second floor by a very narrow, iron, spiral staircase, which led directly from the room to the upper storeys of the building. As she went up she*

1 [This was during the 1914–18 War, in which one of her sons was engaged on active service.]

2 ['*Liebesdienste*' means in the first instance 'services performed for love', i.e. 'unremunerated services'; but it could bear another, less respectable, meaning.]

heard an officer say: "That's a tremendous decision to make – no matter whether a woman's young or old! Splendid of her!" Feeling simply that she was doing her duty, she walked up an interminable staircase.

'The dream was repeated twice in the course of a few weeks, with, as the lady remarked, some quite unimportant and meaningless modifications.'[1]

From its continuous nature, the dream resembles a daytime phantasy: there are few breaks in it, and some of the details of its content could have been explained if they had been enquired into, but that, as you know, was not done. But what is remarkable and interesting from our point of view is that the dream shows several gaps – gaps not in the dreamer's memory of the dream but in the content of the dream itself. At three points the content was, as it were, extinguished; the speeches in which these gaps occurred were interrupted by a mumble. As no analysis was carried out, we have, strictly speaking, no right to say anything about the sense of the dream. Nevertheless there are hints on which conclusions can be based (for instance, in the phrase 'love services'); but above all, the portions of the speeches immediately preceding the mumbles call for the gaps to be filled in, and in an unambiguous manner. If we make the insertions, the content of the phantasy turns out to be that the dreamer is prepared, by way of fulfilling a patriotic duty, to put herself at the disposal of the troops, both officers and other ranks, for the satisfaction of their erotic needs. This is, of course, highly objectionable, the model of a shameless libidinal phantasy – but it does not appear in the dream at all. Precisely at the points at which the context would call for this admission, the manifest dream contains an indistinct mumble: something has been lost or suppressed.

You will, I hope, think it plausible to suppose that it was precisely the [139] objectionable nature of these passages that was the motive for their suppression. Where shall we find a parallel to such an event? You need not look far in these days. Take up any political newspaper and you will find that here and there the text is absent and in its place nothing except the white paper is to be seen. This, as you know, is the work of the press censorship. In these empty places there was something that displeased the higher censorship authorities and for that reason it was removed – a pity, you feel, since no doubt it was the most interesting thing in the paper – the 'best bit'.

On other occasions the censorship has not gone to work on a passage

1 [This dream was later (in 1919) added as a footnote to *I. of D.*, **4**, 127.]

after it has already been completed. The author has seen in advance which passages might expect to give rise to objections from the censorship and has on that account toned them down in advance, modified them slightly, or has contented himself with approximations and allusions to what would genuinely have come from his pen. In that case there are no blank places in the paper, but circumlocutions and obscurities of expression appearing at certain points will enable you to guess where regard has been paid to the censorship in advance.

Well, we can keep close to this parallel. It is our view that the omitted pieces of the speeches in the dream which were concealed by a mumble have likewise been sacrificed to a censorship. We speak in so many words of a '*dream censorship*' [*Traumzensur*], to which some share in dream distortion is to be attributed. Wherever there are gaps in the manifest dream the dream censorship is responsible for them. We should go further, and regard it as a manifestation of the censorship wherever a dream element is remembered especially faintly, indefinitely and doubtfully among other elements that are more clearly constructed. But it is only rarely that this censorship manifests itself so undisguisedly – so naively, one might say – as in this example of the dream of 'love services'. The censorship takes effect much more frequently according to the second method, by producing softenings, approximations and allusions instead of the genuine thing.

I know of no parallel in the operations of the press censorship to a third manner of working by the dream censorship; but I am able to demonstrate it from precisely the one example of a dream which we have
[140] analysed so far. You will recall the dream of the 'three bad theatre tickets for 1 florin 50' [p. 107 above]. In the latent thoughts of that dream the element 'overhurriedly, too early' stood in the foreground. Thus: it was absurd to marry so *early* – it was also absurd to take the theatre tickets so *early* – it was ridiculous of the sister-in-law to part with her money in such a *hurry* to buy jewellery with it. Nothing of this central element of the dream thoughts passed over into the manifest dream; in it the central position is taken by the 'going to the theatre' and 'taking the tickets'. As a result of this displacement of accent, this fresh grouping of the elements of the content, the manifest dream has become so unlike the latent dream thoughts that no-one would suspect the presence of the latter behind the former. This displacement of accent is one of the chief instruments of dream distortion and it is what gives the dream the strangeness on account of which the dreamer himself is not inclined to recognize it as his own production.

Omission, modification, fresh grouping of the material – these, then, are the activities of the dream censorship and the instruments of dream distortion. The dream censorship itself is the originator, or one of the originators, of the dream distortion which we are now engaged in examining. We are in the habit of combining the concepts of modification and rearrangement under the term 'displacement' [*Verschiebung*][T].

After these remarks on the activities of the dream censorship, we will now turn to its dynamics. I hope you do not take the term too anthropomorphically, and do not picture the 'censor of dreams' as a severe little manikin or a spirit living in a closet in the brain and there discharging his office; but I hope too that you do not take the term in too 'localizing' a sense, and do not think of a 'brain centre', from which a censoring influence of this kind issues, an influence which would be brought to an end if the 'centre' were damaged or removed.[1] For the time being it is nothing more than a serviceable term for describing a dynamic relation. The word does not prevent our asking by what purposes[2] this influence is exercised and against what purposes it is directed. And we shall not be surprised to learn that we have come up against the dream censorship once already, though perhaps without recognizing it.

For that is in fact the case. You will recall that when we began to make [141]
use of our technique of free association we made a surprising discovery. We became aware that our efforts at proceeding from the dream element to the unconscious element for which it is a substitute were being met with a *resistance* [p. 101 f. above]. This resistance, we said, could be of different magnitudes, sometimes enormous and sometimes quite insignificant. In the latter case we need to pass through only a small number of intermediate links in our work of interpretation; but when the resistance is large we have to traverse long chains of associations from the dream element, we are led far away from it and on our path we have to overcome all the difficulties which represent themselves as critical objections to the ideas that occur [*Einfall*]. What we met with as resistance in our work of interpretation must now be introduced into the dream-work in the form of the dream censorship. The resistance to interpretation is only a putting into effect[3] of the dream censorship. It

1 [As a neurologist, Freud (1891*b*), *NSW*, **4**, strongly opposed the notion that complex mental activities could be narrowly localized in the brain.]

2 [Or, here and in what follows, 'trends'. Cf. footnote 1, p. 36 above.]

3 ['*Objektivierung*', literally 'making objective'. The term is used several times in an early paper of Freud's on hypnotic treatment (1892–93*a*) and again in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 81–2. Freud himself seems to use the term '*Realisierung*' (realization) as a synonym. See Freud (1897*b*), ibid., **3**, 242.]

also proves to us that the force of the censorship is not exhausted in bringing about the distortion of dreams and thereafter extinguished, but that the censorship persists as a permanent institution which has as its aim the maintenance of the distortion. Moreover, just as the strength of the resistance varies in the interpretation of each element in a dream, so too the magnitude of the distortion introduced by the censorship varies for each element in the same dream. If we compare the manifest and the latent dream, we shall find that some particular latent elements have been completely eliminated, others modified to a greater or lesser extent, while yet others have been carried over into the manifest content of the dream unaltered or even perhaps strengthened.

But we wanted to enquire what are the purposes which exercise the censorship and against what purposes it is directed. Now this question, which is fundamental for the understanding of dreams and perhaps, indeed, of human life, is easy to answer if we look through the series of [142] dreams which have been interpreted. The purposes which exercise the censorship are those which are acknowledged by the dreamer's waking judgement, those with which he feels himself at one. You may be sure that, if you reject an interpretation of one of your own dreams which has been correctly carried out, you are doing so for the same motives for which the dream censorship has been exercised, the dream distortion brought about and the interpretation made necessary. Take the dream of our fifty-year-old lady [p. 120 above]. She thought her dream disgusting without having analysed it, and she would have been still more indignant if Dr von Hug-Hellmuth had told her anything of its inevitable interpretation; it was precisely because of this condemnation by the dreamer that the objectionable passages in her dream were replaced with a mumble.

The purposes *against* which the dream censorship is directed must be described in the first instance from the point of view of that agency itself. If so, one can say only that they are invariably of a reprehensible nature, repulsive from the ethical, aesthetic and social point of view – matters of which one does not venture to think at all or thinks only with disgust. These wishes, which are censored and given a distorted expression in dreams, are first and foremost manifestations of an unbridled and ruthless egoism [*Egoismus*]. And, to be sure, the dreamer's own ego [*Ich*][T] appears in every dream and plays the chief part in it, even if it knows quite well how to hide itself so far as the manifest content goes. This '*sacro egoismo*' of dreams is certainly not unrelated to the attitude we

adopt when we sleep, which consists in our withdrawing our interest from the whole external world.[1]

The ego, freed from all ethical bonds, also finds itself at one with all the demands of sexual desire, even those which have long been condemned by our aesthetic upbringing and those which contradict all the requirements of moral restraint. The desire for pleasure [*Lustbestreben*] – the 'libido', as we call it – chooses its objects without inhibition, and by preference, indeed, the forbidden ones: not only other men's wives, but above all incestuous objects, objects sanctified by the common agreement of mankind, a man's mother and sister, a woman's father and [143]
brother. (The dream of our fifty-year-old lady, too, was incestuous; her libido was unmistakably directed to her son. [Cf. footnote 1, p. 120 above.]) Lusts which we think of as remote from human nature show themselves strong enough to provoke dreams. Hatred, too, rages without restraint. Wishes for revenge and death directed against those who are nearest and dearest in waking life, against the dreamer's parents, brothers and sisters, husband or wife, and his own children are nothing unusual. These censored wishes appear to rise up out of a positive Hell; after they have been interpreted when we are awake, no censorship of them seems to us too severe.

But you must not blame the dream itself on account of its evil content. Do not forget that it performs the innocent and indeed useful function of preserving sleep from disturbance. This wickedness is not part of the essential nature of dreams. Indeed you know too that there are dreams which can be recognized as the satisfaction of justified wishes and of pressing bodily needs. These, it is true, have no dream distortion; but they have no need of it, for they can fulfil their function without insulting the ethical and aesthetic purposes[2] of the ego. Bear in mind, too, that dream distortion is proportionate to two factors. On the one hand it becomes greater the worse the wish that has to be censored; but on the other hand it also becomes greater the more severe the demands of the censorship at the moment. Thus a strictly brought-up and prudish young girl, with a relentless censorship, will distort dream impulses [*Traumregungen*] which we doctors, for instance, would have to regard as permissible, harmless, libidinal wishes, and on which in ten years' time the dreamer herself will make the same judgement.

Furthermore, we have not got nearly far enough yet to be able to feel

1 [In a footnote added to *I. of D.*, **4**, 240 *n.* 2, in 1925, Freud made some qualification of his statement that dreams are entirely egoistic.]

2 [See footnote 2, p. 123 above.]

indignant at this result of our work of interpretation. We do not yet, I think, understand it properly; but our first duty is to defend it against certain aspersions. There is no difficulty in finding a weak point in it. Our dream interpretations are made on the basis of the premises which we have already accepted [p. 88 f. above] – that dreams in general have a sense, that it is legitimate to carry across from hypnotic to normal sleep
[144] the fact of the existence of mental processes which are at the time unconscious, and that everything that occurs to the mind is determined. If on the basis of these premises we had arrived at plausible findings from dream interpretation, we should have been justified in concluding that the premises were valid. But how about it if these findings seem to be as I have pictured them? We should then be tempted to say: 'These are impossible, senseless or at the least most improbable findings; so there was something wrong about the premises. Either dreams are not psychical phenomena, or there is nothing unconscious in the normal state, or our technique has a flaw in it. Is it not simpler and more satisfactory to suppose this rather than accept all the abominations which we are supposed to have discovered on the basis of our premises?'

Yes, indeed! Both simpler and more satisfactory – but not necessarily on that account more correct. Let us give ourselves time: the matter is not yet ripe for judgement. And first, we can further strengthen the criticism of our dream interpretations. The fact that the findings from them are so disagreeable and repellent need not, perhaps, carry very great weight. A stronger argument is that the dreamers to whom we are led to attribute such wishful purposes by the interpretation of their dreams reject them most emphatically and for good reasons. 'What?' says one of them, 'you want to convince me from this dream that I regret the money I have spent on my sister's dowry and my brother's education? But that cannot be so. I work entirely for my brothers and sisters; I have no other interest in life but to fulfil my duties to them, which, as the eldest of the family, I promised our departed mother I would do.' Or a woman dreamer would say: 'You think I wish my husband was dead? That is a shocking piece of nonsense! It is not only that we are most happily married – you would probably not believe me if I said that – but his death would rob me of everything I possess in the world.' Or another man would answer us: 'You say that I have sensual desires for my sister? That is ridiculous! She means nothing at all to me. We are on bad terms with each other and I have not exchanged a word with her for years.' We might still take it lightly, perhaps, if these dreamers neither confirmed nor denied [*verleugneten*] the purposes we attribute to them; we might

say that these were just things they did not know about themselves. But when they feel in themselves the precise contrary of the wish we have [145] interpreted to them and when they are able to prove to us by the lives they lead that they are dominated by this contrary wish, it must surely take us aback. Has not the time come to throw aside the whole work we have done on dream interpretation as something which its findings have reduced *ad absurdum*?

No, not even now. Even this stronger argument collapses if we examine it critically. Granted that there are unconscious purposes in mental life, nothing is proved by showing that purposes opposed to these are dominant in conscious life. Perhaps there is room in the mind for contrary purposes, for contradictions, to exist side by side. Possibly, indeed, the dominance of one impulse is precisely a necessary condition of its contrary being unconscious. We are after all left, then, with the first objections that were raised: the findings of dream interpretation are not simple and they are very disagreeable. We may reply to the first that all your passion for what is simple will not be able to solve a single one of the problems of dreams. You must get accustomed here to assuming a complicated state of affairs. And we may reply to the second that you are plainly wrong to use a liking or disliking that you may feel as the ground for a scientific judgement. What difference does it make if the findings of dream interpretation seem disagreeable to you or, indeed, embarrassing and repulsive? '*Ça n'empêche pas d'exister*', as I heard my teacher Charcot say in a similar case when I was a young doctor.[1] One must be humble and hold back one's sympathies and antipathies if one wants to discover what is real in this world. If a physicist were able to prove to you that in a short period organic life on this earth would be brought to an end by freezing, would you venture to make the same reply to him: 'That cannot be so, the prospect is too disagreeable'? You would, I think, be silent, until another physicist came and pointed out to the first one an error in his premises or calculations. When you reject something that is disagreeable to you, what you are doing is *repeating* the mechanism of [146] constructing dreams rather than understanding it and surmounting it.

You will promise now, perhaps, to disregard the repellent character of the censored dream wishes and will withdraw upon the argument that after all it is unlikely that such a large space should be given to the evil in the constitution of human beings. But do your own experiences justify

1 [Charcot's remark in full was: 'La théorie, c'est bon, mais ça n'empêche pas d'exister.' ('Theory is good; but it doesn't prevent things from existing.') A favourite quotation of Freud's. See his obituary of Charcot (1893*f*), *NSW*, **4**; *RSE*, **3**, 13, where the circumstances are described.]

your saying this? I will not discuss how you may appear to yourselves; but have you found so much benevolence among your superiors and competitors, so much chivalry among your enemies and so little envy in your social surroundings that you feel it your duty to protest against egoistic evil having a share in human nature? Are you not aware of how uncontrolled and untrustworthy the average person is in everything to do with sexual life? Or do you not know that all the transgressions and excesses of which we dream at night are daily committed in real life by waking men? What does psychoanalysis do here but confirm Plato's old saying that the good are those who are content to dream of what the others, the bad, really do?[1]

And now turn your eyes away from individuals and consider the Great War which is still laying Europe waste. Think of the vast amount of brutality, cruelty and lies which are able to spread over the civilized world. Do you really believe that a handful of ambitious and deluding men without conscience could have succeeded in unleashing all these evil spirits if their millions of followers did not share their guilt? Do you venture, in such circumstances, to break a lance on behalf of the exclusion of evil from the mental constitution of mankind?[2]

You will represent to me that I am giving a one-sided judgement on the war: that it has also brought to light what is finest and noblest in men, their heroism, their self-sacrifice, their social sense. No doubt; but are you not now showing yourselves as accessories to the injustice that has so often been done to psychoanalysis in reproaching it with denying one thing because it has asserted another? It is not our intention to dispute the noble endeavours of human nature, nor have we ever done
[147] anything to detract from their value. On the contrary; I am exhibiting to you not only the evil dream wishes which are censored but also the censorship, which suppresses them and makes them unrecognizable. We lay a stronger emphasis on what is evil in men only because other people disavow [*verleugnen*] it and thereby make the human mind, not better, but incomprehensible. If now we give up this one-sided ethical valuation, we shall undoubtedly find a more correct formula for the relation between good and evil in human nature.

There it is, then. We need not give up the findings of our work on the interpretation of dreams even though we cannot but regard them as strange. Perhaps we shall be able to approach an understanding of them

1 [Quoted in *I. of D.*, **4**, 59.]

2 [Freud's strongest impeachment of the destructive side of human nature was made in Chapters V and VI of *Civilization and its Discontents* (1930*a*), *RSE*, **21**, 97 ff. and 105 ff.]

later from another direction. For the time being let us hold fast to this: dream distortion is a result of the censorship which is exercised by recognized purposes of the ego against wishful impulses in any way objectionable that stir within us at night-time during our sleep. Why this should happen particularly at night-time and where these reprehensible wishes come from – these are matters on which, no doubt, much still remains for questioning and research.

But it would be unfair if we neglected at this point to emphasize sufficiently another outcome of our investigations. The dream wishes which seek to disturb us in our sleep are unknown to us and indeed we only learnt of them through dream interpretation. They are thus to be described, in the sense we have discussed, as unconscious for the time being. But we must reflect that they are unconscious too for more than the time being. The dreamer also disavows them, as we have seen in so many instances, after he has come to know them through the interpretation of his dream. We are then faced once again with the position we first came across in the 'hiccoughing' slip of the tongue [p. 44 above], where the proposer of the toast protested indignantly that neither then nor at any earlier time had he become conscious of any disrespectful impulse towards his chief. Already at the time we felt some doubts about the weight of an assurance of this kind, and suggested instead the hypothesis that the speaker was permanently unaware of the presence of this impulse in him. This situation is repeated now with every interpretation of a strongly distorted dream and consequently gains an increased [148]
importance in its bearing on the view we have taken. We are now prepared to assume that there are in the mind processes and purposes of which one knows nothing at all, has known nothing for a long time, and has even perhaps never known anything. With this the unconscious acquires a new sense for us; the characteristic of 'for the time being' or 'temporary' disappears from its essential nature. It can mean *permanently* unconscious and not merely 'latent at the time'. We shall of course have to hear more about this on some other occasion.

LECTURE X

SYMBOLISM IN DREAMS[1]

[149] Ladies and Gentlemen, we have found that the distortion in dreams, which interferes with our understanding of them, is the result of a censoring activity which is directed against unacceptable, unconscious wishful impulses. We have not, of course, maintained that the censorship is the sole factor responsible for the distortion in dreams, and in fact when we study them further we can discover that other factors play a part in producing this result. This amounts to our saying that even if the dream censorship was out of action we should still not be in a position to understand dreams, the manifest dream would still not be identical to the latent dream thoughts.

We come upon this other factor which prevents dreams from being lucid, this new contribution to dream distortion, by noticing a gap in our technique. I have already admitted to you [p. 93 above] that it does sometimes really happen that nothing occurs to a person under analysis in response to particular elements of his dreams. It is true that this does not happen as often as he asserts; in a great many cases, with perseverance, an idea is extracted from him. But nevertheless there remain cases in which an association fails to emerge or, if it *is* extracted, does not give us what we expected from it. If this happens during a psychoanalytic treatment, it has a peculiar significance with which we are not here concerned.[2] But
[150] it also happens in the interpretation of normal people's dreams or in that of our own. If we convince ourselves that in such cases no amount of pressure is of any use, we eventually discover that this unwished-for event

1 [As Freud tells us (*I. of D.*, **5**, 313), it was relatively late before he realized the full importance of dream symbolism, largely under the influence of Wilhelm Stekel (1911*a*). It was not until the fourth (1914) edition of *I. of D.* that a special section was devoted to the subject. That section (Chapter VI, Section E) represents, apart from the present lecture, Freud's main discussion of symbolism. The topic appears, of course, in many other places both in *I. of D.* and in other works throughout Freud's life, and references to these can be found at a few points below. It may be added, however, that the present lecture has claims to being regarded as the most important of all Freud's writings on symbolism.]

2 [The reference here is to the blocking of free associations by unconscious stirring up of the transference. Cf. 'The Dynamics of Transference' (1912*b*), *RSE*, **12**, 97 ff. See also Lecture XXVII, Vol. 16, p. 381 ff. below.]

regularly occurs in connection with particular dream elements, and we begin to recognize that a fresh general principle is at work where we had begun by thinking we were only faced with an exceptional failure of technique.

In this way we are tempted to interpret these 'mute' dream elements ourselves, to set about translating them with our own resources. We are then forced to recognize that whenever we venture on making a replacement of this sort we arrive at a satisfactory sense for the dream, whereas it remains senseless and the chain of thought is interrupted so long as we refrain from intervening in this way. An accumulation of many similar cases eventually gives the necessary certainty to what began as a timid experiment.

I am putting all this in a rather schematic way; but that is permissible, after all, for didactic purposes, nor has it been falsified, but merely simplified.

In this way we obtain constant translations for a number of dream elements – just as popular 'dream books' provide them for *everything* that appears in dreams. You will not have forgotten, of course, that when we use our *associative* technique constant replacements of dream elements never come to light.

You will object at once that this method of interpretation strikes you as far more insecure and open to attack than the earlier one by means of free association. There is, however, something further. For when, with experience, we have collected enough of these constant renderings, the time comes when we realize that we should in fact have been able to deal with these portions of dream interpretation from our own knowledge, and that they could really be understood without the dreamer's associations. How it is that we must necessarily have known their meaning will become clear in the second half of our present discussion.

A constant relation of this kind between a dream element and its translation is described by us as a 'symbolic' one, and the dream element itself as a 'symbol' of the unconscious dream thought. You will recall that earlier, when we were investigating the relations between dream elements and the 'genuine' thing behind them, I distinguished three such relations – those of a part to a whole, of allusion and of plastic portrayal. I warned you at the time that there was a fourth, but I did not name it [p. 107 above]. This fourth relation is the symbolic one which I am now introducing. It gives occasion for some most interesting discussions, and I will turn to them before laying before you the detailed results of our observations of symbolism. [151]

Symbolism is perhaps the most remarkable chapter of the theory of dreams. In the first place, since symbols are stable translations, they realize to some extent the ideal of the ancient as well as of the popular interpretation of dreams, from which, with our technique, we had departed widely. They allow us in certain circumstances to interpret a dream without questioning the dreamer, who indeed would in any case have nothing to tell us about the symbol. If we are acquainted with the ordinary dream symbols, and in addition with the dreamer's personality, the circumstances in which he lives and the impressions which preceded the occurrence of the dream, we are often in a position to interpret a dream straight away – to translate it at sight, as it were. A piece of virtuosity of this kind flatters the dream interpreter and impresses the dreamer; it forms an agreeable contrast to the laborious work of questioning the dreamer. But do not allow yourselves to be led astray by this. It is not our business to perform acts of virtuosity. Interpretation based on a knowledge of symbols is not a technique which can replace or compete with the associative one. It forms a supplement to the latter and yields results which are only of use when introduced into it. And as regards acquaintance with the dreamer's psychical situation, you must bear in mind that the dreams of people you know well are not the only ones you have to analyse, that you are not as a rule familiar with the events of the previous day, which were the instigators of the dream, but that the associations of the person you are analysing will provide you precisely with a knowledge of what we call the psychical situation.

Moreover, it is quite specially remarkable – having regard, too, to some considerations which we shall mention later [cf. p. 147 below] – that [152] the most violent resistances have been expressed once again to the existence of a symbolic relation between dreams and the unconscious. Even people of judgement and reputation, who, apart from this, have gone a long way in agreeing with psychoanalysis, have at this point withheld [*versagt*] their support. This behaviour is all the stranger in view, first, of the fact that symbolism is not peculiar to dreams alone and is not characteristic of them, and, secondly, that symbolism in dreams is by no means a discovery of psychoanalysis, however many other surprising discoveries it has made. The philosopher K. A. Scherner (1861) must be described as the discoverer of dream symbolism, if its beginning is to be placed in modern times at all. Psychoanalysis has confirmed Scherner's findings, though it has made material modifications in them.

You will now want to hear something of the nature of dream symbolism and to be given some examples of it. I will gladly tell you what

I know, though I must confess that our understanding of it does not go as far as we should like.

The essence of this symbolic relation is that it is a comparison, though not a comparison of *any* sort. Special limitations seem to be attached to the comparison, but it is hard to say what these are. Not everything with which we can compare an object or a process appears in dreams as a symbol for it. And on the other hand a dream does not symbolize every possible element of the latent dream thoughts but only certain definite ones. So there are restrictions here in both directions. We must admit, too, that the concept of a symbol cannot at present be sharply delimited: it shades off into such notions as those of a replacement or representation, and even approaches that of an allusion. With a number of symbols the comparison which underlies them is obvious. But again there are other symbols in regard to which we must ask ourselves where we are to look for the common element, the *tertium comparationis*, of the supposed comparison. On further reflection we may afterwards discover it or it may definitely remain concealed. It is strange, moreover, that if a symbol is a comparison it should not be brought to light by an association, and that the dreamer should not be acquainted with it but should make use of it without knowing about it: more than that, indeed, that the dreamer feels no inclination to acknowledge the comparison even after it has been pointed out to him. You see, then, that a symbolic relation is [153]
a comparison of a quite special kind, of which we do not as yet clearly grasp the basis, though perhaps we may later arrive at some indication of it.

The range of things which are given symbolic representation in dreams is not wide: the human body as a whole, parents, children, brothers and sisters, birth, death, nakedness – and something else besides. The one typical – that is regular – representation of the human figure as a whole is a *house*, as was recognized by Scherner, who even wanted to give this symbol a transcendent importance which it does not possess. It may happen in a dream that one finds oneself climbing down the façade of a house, enjoying it at one moment, frightened at another. The houses with smooth walls are men, the ones with projections and balconies that one can hold on to are women [cf. p. 138 f. below]. One's parents appear in dreams as the *Emperor* and *Empress*, the *King* and *Queen* [loc. cit.] or other honoured personages; so here dreams are displaying much filial piety. They treat children and brothers and sisters less tenderly: these are symbolized as *small animals* or *vermin*. Birth is almost invariably

represented by something which has a connection with *water*: one either falls into the water or climbs out of it, one rescues someone from the water or is rescued by someone – that is to say, the relation is one of mother to child [cf. p. 139 f. below]. Dying is replaced in dreams by *departure*, by a *train journey* [cf. p. 140], being dead by various obscure and, as it were, timid hints, nakedness by *clothes* and *uniforms*. You see how indistinct the boundaries are here between symbolic and allusive representation.

It is a striking fact that, compared with this scanty enumeration, there is another field in which the objects and topics are represented with an extraordinarily rich symbolism. This field is that of sexual life – the genitals, sexual processes, sexual intercourse. The very great majority of symbols in dreams are sexual symbols. And here a strange disproportion is revealed. The topics I have mentioned are few, but the symbols for them are extremely numerous, so that each of these things can be expressed by numbers of almost equivalent symbols. The outcome,
[154] when they are interpreted, gives rise to general objection. For, in contrast to the multiplicity of the representations in the dream, the interpretations of the symbols are very monotonous, and this displeases everyone who hears of it; but what is there that we can do about it?

Since this is the first time I have spoken of the subject matter of sexual life in one of these lectures, I owe you some account of the way in which I propose to treat the topic. Psychoanalysis finds no occasion for concealments and hints, it does not think it necessary to be ashamed of dealing with this important material, it believes it is right and proper to call everything by its correct name, and it hopes that this will be the best way of keeping irrelevant thoughts of a disturbing kind at a distance. The fact that these lectures are being given before a mixed audience of both sexes can make no difference to this. Just as there can be no science *in usum Delphini*,[1] there can be none for schoolgirls; and the ladies among you have made it clear by their presence in this lecture room that they wish to be treated on an equality with men.

The male genitals, then, are represented in dreams in a number of ways that must be called symbolic, where the common element in the comparison is mostly very obvious. To begin with, for the male genitals as a whole the sacred number 3 is of symbolic significance [cf. p. 143 below]. The more striking and for both sexes the more interesting

1 [Cf. footnote 2, p. 89 above.]

component of the genitals, the male organ, finds symbolic substitutes in the first instance in things that resemble it in shape – things, accordingly, that are long and up-standing, such as *sticks*, *umbrellas*, *posts*, *trees* and so on; further, in objects which share with the thing they represent the characteristic of penetrating into the body and injuring – thus, sharp *weapons* of every kind, *knives*, *daggers*, *spears*, *sabres*, but also firearms, *rifles*, *pistols* and *revolvers* (particularly suitable owing to their shape). In the anxiety dreams of girls, being followed by a man with a knife or a firearm plays a large part. This is perhaps the commonest instance of dream symbolism and you will now be able to translate it easily. Nor is there any difficulty in understanding how it is that the male organ can be replaced with objects from which water flows – *water-taps*, *watering-cans* or *fountains* – or again with other objects which are capable of being lengthened, such as *hanging-lamps*, *extensible pencils*, etc. A no less obvious aspect of the organ explains the fact that *pencils*, *pen-holders*, *nail-files*, *hammers* and other *instruments* are undoubted male sexual symbols. [155]

The remarkable characteristic of the male organ which enables it to rise up in defiance of the laws of gravity, one of the phenomena of erection, leads to its being represented symbolically by *balloons*, *flying-machines* and most recently by *Zeppelin airships*. But dreams can symbolize erection in yet another, far more expressive manner. They can treat the sexual organ as the essence of the dreamer's whole person and make him himself *fly*. Do not take it to heart if dreams of flying, so familiar and often so delightful, have to be interpreted as dreams of general sexual excitement, as erection dreams. Among students of psychoanalysis, Paul Federn [1914] has placed this interpretation beyond any doubt; but the same conclusion was reached from his investigations by Mourly Vold [1910–12, **2**, 791], who has been so much praised for his sobriety, who carried out the dream experiments I have referred to [p. 76 above] with artificially arranged positions of the arms and legs and who was far removed from psychoanalysis and may have known nothing about it. And do not make an objection out of the fact that women can have the same flying dreams as men. Remember, rather, that our dreams aim at being the fulfilments of wishes and that the wish to be a man is found so frequently, consciously or unconsciously, in women. Nor will anyone with a knowledge of anatomy be bewildered by the fact that it is possible for women to realize this wish through the same sensations as men. Women possess as part of their genitals a small organ similar to the male one; and this small organ, the

clitoris, actually plays the same part in childhood and during the years before sexual intercourse as the large organ in men.[1]

Among the less easily understandable male sexual symbols are certain *reptiles* and *fishes*, and above all the famous symbol of the *snake*. It is certainly not easy to guess why *hats* and *overcoats* or *cloaks* are employed in the same way, but their symbolic significance is quite unquestionable [cf. p. 137 below]. And finally we can ask ourselves whether the replace-
[156] ment of the male limb with another limb, the foot or the hand, should be described as symbolic. We are, I think, compelled to do so by the context and by counterparts in the case of women.

The female genitals are symbolically represented by all such objects as share their characteristic of enclosing a hollow space which can take something into itself: by *pits*, *cavities* and *hollows*, for instance, by *vessels* and *bottles*, by *receptacles*, *boxes*, *trunks*, *cases*, *chests*, *pockets*, and so on. *Ships*, too, fall into this category. Some symbols have more connection with the uterus than with the female genitals: thus, *cupboards*, *stoves* and, more especially, *rooms*. Here room symbolism touches on house symbolism. *Doors* and *gates*, again, are symbols of the genital orifice. Materials, too, are symbols for women [cf. p. 139 below]: *wood*, *paper* and objects made of them, like *tables* and *books*. Among animals, *snails* and *mussels* at least are undeniably female symbols; among parts of the body, the *mouth* (as a substitute for the genital orifice); among buildings, *churches* and *chapels*. Not every symbol, as you will observe, is equally intelligible.

The breasts must be reckoned with the genitals, and these, like the larger hemispheres of the female body, are represented by *apples*, *peaches* and *fruit* in general. The pubic hair of both sexes is depicted in dreams as *woods* and *bushes*. The complicated topography of the female genital parts makes one understand how it is that they are often represented as *landscapes*, with rocks, woods and water,[2] while the imposing mechanism of the male sexual apparatus explains why all kinds of complicated machinery which is hard to describe serve as symbols for it.

Another symbol of the female genitals which deserves mention is a *jewel case*.[3] *Jewel* and *treasure* are used in dreams as well as in waking life to describe someone who is loved. *Sweets* frequently represent sexual enjoyment. Satisfaction obtained from a person's own genitals is

1 [This is further discussed in Vol. 16, p. 280 below.]

2 [A dream with a quantity of landscape symbolism is reported below, p. 168.]

3 [This played a prominent part in the analysis of the first dream in the case history of 'Dora' (1905*e*), *RSE*, **7**, 58 ff.]

indicated by all kinds of *playing*, including *piano-playing*. Symbolic representations *par excellence* of masturbation are *gliding* or *sliding* and *pulling off a branch* [cf. p. 143 below]. The *falling out of a tooth* or the *pulling out of a tooth* is a particularly notable dream symbol. Its first meaning is undoubtedly castration as a punishment for masturbating [157]
[loc. cit.]. We come across special representations of sexual intercourse less often than might be expected from what has been said so far. Rhythmical activities such as *dancing*, *riding* and *climbing* must be mentioned here, as well as violent experiences such as *being run over*; so, too, certain *manual* crafts, and, of course, *threatening with weapons*.

You must not picture the use or the translation of these symbols as something quite simple. In the course of them all kinds of things happen which are contrary to our expectations. It seems almost incredible, for instance, that in these symbolic representations the differences between the sexes are often not clearly observed. Some symbols signify genitals in general, irrespective of whether they are male or female: for instance, a *small* child, a *small* son or a *small* daughter.[1] Or again, a predominantly male symbol may be used for the female genitals or *vice versa*. We cannot understand this till we have obtained some insight into the development of sexual ideas in human beings. In some instances the ambiguity of the symbols may only be an apparent one; and the most marked symbols, such as *weapons*, *pockets* and *chests*, are excluded from this bisexual use.

I will now go on to make a survey, starting not from the thing represented but from the symbol, of the fields from which sexual symbols are mostly derived, and I will make a few additional remarks, with special reference to the symbols where the common element in the comparison is not understood. The *hat* is an obscure symbol of this kind – perhaps, too, head-coverings in general – with a male significance as a rule, but also capable of a female one.[2] In the same way an *overcoat* or *cloak* means a man, perhaps not always with a genital reference; it is open to you to ask why.[3] Neckties, which hang down and are not worn by [158]
women, are a definitely male symbol. *Underclothing* and *linen* in general are female. *Clothes* and *uniforms*, as we have already seen, are a

1 [That is, any one of these three may be used in a dream as a symbol for either the male or the female genitals.]

2 [Hat symbolism was discussed by Freud in his short paper 'A Connection between a Symbol and a Symptom' (1916–17*c*), *RSE*, **14**, 341–2.]

3 [In *I. of D.*, **5**, 317 f., Freud suggests that the explanation may be a verbal assonance between '*Mann*' and '*Mantel*' (the German for 'overcoat' or 'cloak'). A further discussion of this symbol occurs in Lecture XXIX of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 22.]

substitute for nakedness or bodily shapes. *Shoes* and *slippers* are female genitals. *Tables* and *wood* have already been mentioned as puzzling but certainly female symbols. *Ladders*, *steps* and *staircases*, or, more precisely, walking on them, are clear symbols of sexual intercourse. On reflection, it will occur to us that the common element here is the rhythm of walking up them – perhaps, too, the increasing excitement and breathlessness the higher one climbs [cf. p. 143 below].

We have earlier referred to *landscapes* as representing the female genitals. *Hills* and *rocks* are symbols of the male organ. *Gardens* are common symbols of the female genitals. *Fruit* stands, not for children, but for the breasts. *Wild animals* mean people in an excited sensual state, and further, evil drives [*Triebe*] or passions. *Blossoms* and *flowers* indicate women's genitals, or, in particular, virginity. Do not forget that blossoms are actually the genitals of plants.[1]

We are acquainted already with *rooms* as a symbol. The representation can be carried further, for windows, and doors in and out of rooms, take over the meaning of orifices in the body. And the question of the room being *open* or *locked* fits in with this symbolism, and the *key* that opens it is a decidedly male symbol.

Here, then, is material used for symbolism in dreams. It is not complete and could be carried deeper as well as further. But I fancy it will seem to you more than enough and may even have exasperated you. 'Do I really live in the thick of sexual symbols?' you may ask. 'Are all the objects around me, all the clothes I put on, all the things I pick up, all of them sexual symbols and nothing else?' There is really ground enough for raising astonished questions, and, as a first one, we may enquire how we in fact come to know the meaning of these dream symbols, upon which the dreamer himself gives us insufficient information or none at all.

My reply is that we learn it from very different sources – from fairy
[159] tales and myths, from buffoonery and jokes, from folklore (that is, from knowledge about popular manners and customs, sayings and songs) and from poetic and colloquial linguistic usage. In all these directions we come upon the same symbolism, and in some of them we can understand it without further instruction. If we go into these sources in detail, we shall find so many parallels to dream symbolism that we cannot fail to be convinced of our interpretations.

According to Scherner, as we have said [p. 133 above], the human body is often represented in dreams by the symbol of a house. Carrying

1 [A dream with a large amount of flower symbolism is reported in *I. of D.*, **4**, 284, and **5**, 311–12.]

this representation further, we found that windows, doors and gates stood for openings in the body and that façades of houses were either smooth or provided with balconies and projections to hold on to. But the same symbolism is found in our linguistic usage – when we greet an acquaintance familiarly as an '*altes Haus*' ['old house'], when we speak of giving someone '*eins aufs Dachl*' [a knock on the head, literally 'one on the roof'], or when we say of someone else that 'he's not quite right in the upper storey'. In anatomy the orifices of the body are in so many words termed '*Leibespforten*' [literally 'portals of the body'].

It seems surprising at first to find one's parents in dreams as an imperial or royal couple. But it has its parallel in fairy tales. It begins to dawn on us that the many fairy tales which begin 'Once upon a time there were a King and Queen' only mean to say that there were once a father and mother. In a family the children are jokingly called 'princes' and the eldest 'crown prince'. The King himself calls himself the father of his country. We speak of small children jokingly as '*Würmer*' ['worms'] and speak sympathetically of a child as '*der arme Wurm*' ['the poor worm'].

Let us go back to house symbolism. When in a dream we make use of the projections on houses for catching hold of, we may be reminded of a common vulgar expression for well-developed breasts: 'She's got something to catch hold of.' There is another popular expression in such cases: 'She's got plenty of wood in front of the house', which seems to confirm our interpretation of wood as a female, maternal symbol.

And, speaking of wood, it is hard to understand how that material came to represent what is maternal and female. But here comparative philology may come to our help. Our German word '*Holz*' seems to [160] come from the same root as the Greek '*ὑλη* [hulē]', meaning 'stuff', 'raw material'. This seems to be an instance of the not uncommon event of the general name of a material eventually coming to be reserved for some particular material. Now there is an island in the Atlantic named 'Madeira'. This name was given to it by the Portuguese when they discovered it, because at that time it was covered all over with woods. For in the Portuguese language '*madeira*' means 'wood'. You will notice, however, that '*madeira*' is only a slightly modified form of the Latin word '*materia*', which once more means 'material' in general. But '*materia*' is derived from '*mater*', 'mother': the material out of which anything is made is, as it were, a mother to it. This ancient view of the thing survives, therefore, in the symbolic use of wood for 'woman' or 'mother'.

Birth is regularly expressed in dreams by some connection with water: one falls into the water or one comes out of the water – one gives birth

or one is born. We must not forget that this symbol is able to appeal in two ways to evolutionary truth. Not only are all terrestrial mammals, including man's ancestors, descended from aquatic creatures (this is the more remote of the two facts), but every individual mammal, every human being, spent the first phase of its existence in water – namely as an embryo in the amniotic fluid in its mother's uterus, and came out of that water when it was born. I do not say that the dreamer knows this; on the other hand, I maintain that he need not know it. There is something else that the dreamer probably knows from having been told it in his childhood; and I even maintain of that too that his knowledge of it contributed nothing to the construction of the symbol. He was told in his nursery that the stork brings the babies. But where does it fetch them from? From the pond, or from the stream – once again, then, from the water. One of my patients after he had been given this information – he was a little Count at the time – disappeared for a whole afternoon. He was found at last lying by the edge of the castle pool, with his little face bending over the surface of the water eagerly peering down to try to see the babies at the bottom. [Cf. Vol. 16, p. 280 below.]

In myths about the birth of heroes – to which Otto Rank [1909] has
[161] devoted a comparative study, the oldest being that of King Sargon of Agade (about 2800 B.C.) – a predominant part is played by exposure in the water and rescue from the water. Rank has perceived that these are representations of birth, analogous to those that are usual in dreams. If one rescues someone from the water in a dream, one is making oneself into his mother, or simply into *a* mother. In myths a person who rescues a baby from the water is admitting that she is the baby's true mother. There is a well-known comic anecdote according to which an intelligent Jewish boy was asked who the mother of Moses was. He replied without hesitation: 'The Princess.' 'No', he was told, 'she only took him out of the water.' 'That's what *she* says', he replied, and so proved that he had found the correct interpretation of the myth.[1]

Departure in dreams means dying. So, too, if a child asks where someone who has died and whom he misses is, it is common nursery usage to reply that he has gone on a journey. Once more I should like to contradict the belief that the dream symbol is derived from this evasion. The dramatist[2] is using the same symbolic connection when he speaks of the afterlife as 'the undiscovered country from whose bourn no *traveller* returns'.

1 [Freud used this 'correct interpretation of the myth' as the basis of his last work, *Moses and Monotheism* (1939*a*), *RSE*, **23**, 7–8.]

2 [Shakespeare, in *Hamlet*, Act III, Scene 1.]

Even in ordinary life it is common to speak of 'the last journey'. Everyone acquainted with ancient rituals is aware of how seriously (in the religion of ancient Egypt, for instance) the idea is taken of a journey to the land of the dead. Many copies have survived of *The Book of the Dead*, which was supplied to the mummy like a Baedeker to take with him on the journey. Ever since burial places have been separated from dwelling places the dead person's last journey has indeed become a reality.

It is just as little the case that genital symbolism is something that is found only in dreams. Every one of you has probably at one time or another spoken impolitely of a woman as an '*alte Schachtel*' ['old box'], perhaps without knowing that you were using a genital symbol. In the New Testament we find woman referred to as 'the weaker vessel'. The Hebrew scriptures, written in a style that comes close to poetry, are full of sexually symbolic expressions, which have not always been correctly understood and whose exegesis (for instance, in the case of the *Song of* [162] *Solomon*[1]) has led to some misunderstandings. In later Hebrew literature it is very common to find a woman represented by a house, whose door stands for the sexual orifice. A man complains, for instance, in a case of lost virginity, that he has 'found the door open'. So, too, the symbol of a table for a woman in these writings. Thus, a woman says of her husband: 'I laid the table for him, but he turned it round.' Lame children are said to come about through the man's 'turning the table round'. I take these examples from a paper by Dr L. Levy of Brünn [1914].

The fact that ships, too, in dreams stand for women is made credible by the etymologists, who tell us that '*Schiff* [ship]' was originally the name of an earthenware vessel and is the same word as '*Schaff*' [a dialect word meaning 'tub']. That ovens represent women and the uterus [*Mutterleib*][t] is confirmed by the Greek legend of Periander of Corinth and his wife Melissa. The tyrant, according to Herodotus, conjured up the shade of his wife, whom he had loved passionately but had murdered out of jealousy, to obtain some information from her. The dead woman proved her identity by saying that he (Periander) had '*pushed his bread into a cold oven*', as a disguise for an event which no-one else could know of. In the periodical *Anthropophyteia*, edited by F. S. Krauss, an invaluable source of knowledge of sexual anthropology,[2] we learn that in a particular part of Germany they say of a woman who has given birth to a child that '*her oven has come to pieces*'. Kindling fire, and everything to

1 [Some examples are given in *I. of D.*, **5**, 310.]

2 [Cf. Freud's appreciative letter to Krauss (1910*f*), *RSE*, **11**, 223 f.]

do with it, is intimately interwoven with sexual symbolism. Flame is always a male genital, and the fireplace, the hearth is its female counterpart.

If you may have felt surprised at the frequency with which landscapes are used in dreams to represent the female genitals, you can learn from mythology the part played by *Mother Earth* in the concepts and cults of the peoples of antiquity and how their view of agriculture was determined by this symbolism. You will perhaps be inclined to trace the fact that in dreams a room represents a woman to the common usage in our
[163] language by which '*Frau*' is replaced by '*Frauenzimmer*'[1] – the human being is replaced by the apartment allotted to her. Similarly we speak of the 'Sublime Porte',[2] meaning the Sultan and his government. So too the title of the ancient Egyptian ruler, 'Pharaoh', means simply 'Great Courtyard'. (In the ancient East the courts between the double gateways of a city were public meeting places like the marketplaces of the classical world.) This derivation, however, appears to be too superficial. It seems to me more likely that a room became the symbol of a woman as being the space which encloses human beings. We have already found 'house' used in a similar sense; and mythology and poetical language enable us to add 'city', 'citadel', 'castle' and 'fortress' as further symbols for 'woman'. The question could be easily settled from the dreams of people who do not speak or understand German. During the last few years I have mainly treated foreign-speaking patients, and I seem to remember that in their dreams too '*Zimmer*' ['room'] meant '*Frauenzimmer*', though they had no similar usage in their languages. There are other indications that the symbolic relation can go beyond the limits of language – which, incidentally was asserted long ago by an old investigator of dreams, Schubert [1814]. However, none of my dreamers was completely ignorant of German, so the decision must be left to psychoanalysts who can collect data from unilingual people in other countries.

There is scarcely one of the symbolic representations of the male genitals which does not recur in joking, vulgar or poetic usage, especially in the ancient classical dramatists. But here we meet not only the symbols which appear in dreams, but others besides – for instance tools employed in various operations, and particularly the plough. Moreover, the symbolic representation of masculinity leads us to a very extensive and

1 [Literally 'women's apartment'. The word is very often used in German as a slightly derogatory synonym for 'woman'.]

2 [Literally 'Gateway', the old diplomatic term for the Ottoman Court at Constantinople before 1923, derived via the French from the Turkish title.]

much-disputed region, which, on grounds of economy, we shall avoid. I should like, however, to devote a few words to one symbol, which, as it were, falls outside this class – the number 3.[1] Whether this number owes its sacred character to this symbolic connection remains undecided. But what seems certain is that a number of tripartite things that occur in nature – the clover leaf, for instance – owe their use for coats of arms and [164] emblems to this symbolic meaning. Similarly, the tripartite lily – the so-called *fleur-de-lis* – and the remarkable heraldic device of two islands so far apart as Sicily and the Isle of Man – the *triskeles* (three bent legs radiating from a centre) – seem to be stylized versions of the male genitals. Likenesses of the male organ were regarded in antiquity as the most powerful *apotropaic* (means of defence) against evil influences, and, in conformity with this, the lucky charms of our own day can all be easily recognized as genital or sexual symbols. Let us consider a collection of such things – as they are worn, for instance, in the form of small silver hanging trinkets: a four-leaved clover, a pig, a mushroom, a horseshoe, a ladder, a chimney-sweep. The four-leaved clover has taken the place of the three-leaved one which is really suited to be a symbol. The pig is an ancient fertility symbol. The mushroom is an undoubted penis symbol: there are mushrooms [fungi] which owe their systematic name (*Phallus impudicus*) to their unmistakable resemblance to the male organ. The horseshoe copies the outline of the female genital orifice, while the chimney-sweep, who carries the ladder, appears in this company on account of his activities, with which sexual intercourse is vulgarly compared. (Cf. *Anthropophyteia*.) We have made the acquaintance of his ladder in dreams as a sexual symbol; here German linguistic usage comes to our help and shows us how the word '*steigen*' ['to climb' or 'to mount'] is used in what is *par excellence* a sexual sense. We say '*den Frauen nachsteigen*' ['to run' (literally 'climb') 'after women'], and '*ein alter Steiger*' ['an old rake' (literally 'climber')]. In French, in which the word for steps on a staircase is '*marches*', we find a precisely analogous term '*un vieux marcheur*'. The fact that in many large animals climbing or 'mounting' on the female is a necessary preliminary to sexual intercourse probably fits into this context.[2]

'Pulling off a branch' as a symbolic representation of masturbation is not merely in harmony with vulgar descriptions of the act[3] but has far-reaching mythological parallels. But that masturbation, or rather the

1 [Cf. p. 192 below.]

2 [This is largely repeated from Freud's Nuremberg Congress paper (1910*d*), *RSE*, **11**, 131.]

3 [Cf. the English 'tossing off'.]

punishment for it – castration – should be represented by the falling out
[165] or pulling out of teeth is especially remarkable, since there is a counterpart to it in anthropology which can be known to only a very small number of dreamers. There seems to me no doubt that the circumcision practised by so many peoples is an equivalent and substitute for castration. And we now learn that certain primitive tribes in Australia carry out circumcision as a puberty rite (at the festival to celebrate a boy's attaining sexual maturity), while other tribes, their near neighbours, have replaced this act with the knocking out of a tooth.

Here I bring my account of these specimens to an end. They are only specimens. We know more on the subject; but you may imagine how much richer and more interesting a collection like this would be if it were brought together, not by amateurs like us, but by real professionals in mythology, anthropology, philology and folklore.

A few consequences force themselves on our notice; they cannot be exhaustive, but they offer us food for reflection.

In the first place we are faced with the fact that the dreamer has a symbolic mode of expression at his disposal which he does not know in waking life and does not recognize. This is as extraordinary as if you were to discover that your housemaid understood Sanskrit, though you know that she was born in a Bohemian village and never learnt it. It is not easy to account for this fact by the help of our psychological views. We can say only that the knowledge of symbolism is unconscious[1] to the dreamer, that it belongs to his unconscious mental life. But even with this assumption we do not meet the point. Hitherto it has only been necessary for us to assume the existence of unconscious endeavours – endeavours, that is, of which, temporarily or permanently, we know nothing. Now, however, it is a question of more than this, of unconscious pieces of knowledge, of connections of thought, of comparisons between different objects which result in its being possible for one of them to be regularly put in place of the other. These comparisons are not freshly made on each occasion; they lie ready to hand and are complete, once and for all. This is implied by the fact of their agreeing in the case of different individuals – possibly, indeed, agreeing in spite of differences of
[166] language. What can be the origin of these symbolic relations? Linguistic usage covers only a small part of them. The multiplicity of parallels in other spheres of knowledge are mostly unknown to the dreamer; we ourselves have been obliged to collect them laboriously.

1 [Cf. footnote, p. 20 above.]

Secondly, these symbolic relations are not something peculiar to dreamers or to the dream-work through which they come to expression. This same symbolism, as we have seen, is employed by myths and fairy tales, by the people in their sayings and songs, by colloquial linguistic usage and by the poetic imagination. The field of symbolism is immensely wide, and dream symbolism is only a small part of it: indeed, it serves no useful purpose to attack the whole problem from the direction of dreams. Many symbols which are commonly used elsewhere appear in dreams very seldom or not at all. Some dream symbols are not to be found in all other fields but only, as you have seen, here and there. One gets an impression that what we are faced with here is an ancient but extinct mode of expression, of which different pieces have survived in different fields, one piece only here, another only there, a third, perhaps, in slightly modified forms in several fields. And here I recall the phantasy of an interesting psychotic patient, who imagined a 'basic language' of which all these symbolic relations would be residues.[1]

Thirdly, it must strike you that the symbolism in the other fields I have mentioned is by no means solely sexual symbolism, whereas in dreams symbols are used almost exclusively for the expression of sexual objects and relations. This is not easily explained either. Are we to suppose that symbols which originally had a sexual significance later acquired another application and that, furthermore, the toning down of representation by symbols into other kinds of representation may be connected with this? These questions can evidently not be answered so long as we have considered dream symbolism alone. We can only hold firmly to the suspicion that there is a specially intimate relation between true symbols and sexuality.

In this connection we have been given an important hint during the last few years. A philologist, Hans Sperber [1912], of Uppsala, who works independently of psychoanalysis, has put forward the argument that sexual needs have played the biggest part in the origin and development of speech. According to him, the original sounds of speech served for communication, and summoned the speaker's sexual partner; the further development of linguistic roots accompanied the working activities of primal man. These activities, he goes on, were performed in common and were accompanied by rhythmically repeated utterances. In this way a sexual interest became attached to work. Primal man made work acceptable, as it were, by treating it as an equivalent and substitute for [167]

1 [This was Senatspräsident Schreber, whose case history was analysed by Freud (1911c), *RSE*, **12**, 21.]

sexual activity. The words enunciated during work in common thus had two meanings; they denoted sexual acts as well as the working activity equated with them. As time went on, the words became detached from the sexual meaning and fixed to the work. In later generations the same thing happened with new words, which had a sexual meaning and were applied to new forms of work. In this way a number of verbal roots would have been formed, all of which were of sexual origin and had subsequently lost their sexual meaning. If the hypothesis I have here sketched out is correct, it would give us a possibility of understanding dream symbolism. We should understand why dreams, which preserve something of the earliest conditions, have such an extraordinarily large number of sexual symbols, and why, in general, weapons and tools always stand for what is male, while materials and things that are worked upon stand for what is female. The symbolic relation would be the residue of an ancient verbal identity; things which were once called by the same name as the genitals could now serve as symbols for them in dreams.

The parallels we have found to dream symbolism also allow us to form an estimate of the characteristic of psychoanalysis which enables it to attract general interest in a way in which neither psychology nor psychiatry has succeeded in doing. In the work of psychoanalysis links are formed with numbers of other mental sciences, the investigation of which promises results of the greatest value: links with mythology and philology, with folklore, with social psychology and the theory of
[168] religion. You will not be surprised to hear that a periodical has grown up on psychoanalytic soil whose sole aim is to foster these links. This periodical is known as *Imago*, founded in 1912 and edited by Hanns Sachs and Otto Rank.[1] In all these links the share of psychoanalysis is in the first instance that of giver and only to a less extent that of receiver. It is true that this brings it an advantage in the fact that its strange findings become more familiar when they are met with again in other fields; but on the whole it is psychoanalysis which provides the technical methods and the points of view whose application in these other fields should prove fruitful. The mental life of human individuals, when subjected to psychoanalytic investigation, offers us the explanations with the help of which we are able to solve a number of riddles in the life of human communities or at least to set them in a true light.

Incidentally, I have said nothing at all to you yet as to the circumstances in which we can obtain our deepest insight into the hypothetical 'primal

1 [It ceased publication in 1941. A journal with a similar aim, *The American Imago*, was founded by Hanns Sachs in Boston in 1939.]

language' and as to the field in which most of it has survived. Until you know this you cannot form an opinion of its whole significance. For this field is that of the neuroses and its material is the symptoms and other manifestations of neurotic patients, for the explanation and treatment of which psychoanalysis was, indeed, created.

The fourth of my reflections takes us back to the beginning and directs us along our prescribed path. I have said [p. 130 above] that even if there were no dream censorship dreams would still not be easily intelligible to us, for we should still be faced with the task of translating the symbolic language of dreams into that of our waking thought. Thus symbolism is a second and independent factor in the distortion of dreams, alongside of the dream censorship. It is plausible to suppose, however, that the dream censorship finds it convenient to make use of symbolism, since it leads towards the same end – the strangeness and incomprehensibility of dreams.

It will shortly become clear whether a further study of dreams may not bring us up against yet another factor that contributes to the distortion of dreams. But I should not like to leave the subject of dream symbolism without once more [p. 132 above] touching on the problem of how it [169] can meet with such violent resistance in educated people when the wide diffusion of symbolism in myths, religion, art and language is so unquestionable. May it not be that what is responsible is once again its connection with sexuality?

LECTURE XI

THE DREAM-WORK[1]

[170] Ladies and Gentlemen, when you have thoroughly grasped the dream censorship and representation by symbols, you will not yet, it is true, have completely mastered the distortion in dreams, but you will nevertheless be in a position to understand most dreams. In doing so you will make use of both of the two complementary techniques: calling up ideas that occur to the dreamer till you have penetrated from the substitute to the genuine thing and, on the ground of your own knowledge, replacing the symbols with what they mean. Later on we shall discuss some uncertainties that arise in this connection.

We can now take up once more a task that we tried to carry out previously with inadequate means, when we were studying the relations between the elements of dreams and the genuine things they stood for. We laid down four main relations of the kind [p. 105 ff. above]: the relation of a part to a whole, approximation of allusion, the symbolic relation and the plastic representation of words. We now propose to undertake the same thing on a larger scale, by comparing the manifest content of a dream *as a whole* with the latent dream as it is revealed by interpretation.

I hope you will never again confuse these two things with each other. If you reach that point, you will probably have gone further in understanding dreams than most readers of my *Interpretation of Dreams*. And let me remind you once again that the work which transforms the latent dream into the manifest one is called the *dream-work*. The work which proceeds in the contrary direction, which endeavours to arrive at the latent dream from the manifest one, is our *work of interpretation* [*Deutungsarbeit*]. This work of interpretation seeks to undo the dream-work. The dreams of infantile type which we recognize as obvious fulfilments of wishes have nevertheless experienced some amount of dream-work – they have been transformed from a wish into an actual
[171] experience and also, as a rule, from thoughts into visual images. In their

1 [The whole of Chapter VI of *I. of D.* (over a third of the entire book) is devoted to the dream-work.]

case there is no need for interpretation but only for undoing these two transformations. The additional dream-work that occurs in other dreams is called 'dream distortion', and this has to be undone by our work of interpretation.

Having compared the interpretations of numerous dreams, I am in a position to give you a summary description of what the dream-work does with the material of the latent dream thoughts. I beg you, however, not to try to understand too much of what I tell you. It will be a piece of description which should be listened to with quiet attention.

The first achievement of the dream-work is *condensation*[I] [*Verdichtung*][T]. By that we understand the fact that the manifest dream has a smaller content than the latent one, and is thus an abbreviated translation of it. Condensation can on occasion be absent; as a rule it is present, and very often it is enormous. It is never changed into the reverse; that is to say, we never find that the manifest dream is greater in extent or content than the latent one. Condensation is brought about (1) by the total omission of certain latent elements, (2) by only a fragment of some complexes in the latent dream passing over into the manifest one and (3) by latent elements which have something in common being combined and fused into a single unity in the manifest dream.

If you prefer it, we can reserve the term 'condensation' for the last only of these processes. Its results are particularly easy to demonstrate. You will have no difficulty in recalling instances from your own dreams of different people being condensed into a single one. A composite figure of this kind may look like A perhaps, but may be dressed like B, may do something that we remember C doing, and at the same time we may know that he is D. This composite structure [*Mischbildung*] is of course emphasizing something that the four people have in common. It is possible, naturally, to make a composite structure out of things or places in the same way as out of people, provided that the various things and places have in common something which is emphasized by the latent dream. The process is like constructing a new and transitory concept which has this common element as its nucleus. The outcome of this superimposing of the separate elements that have been condensed together is as a rule a blurred and vague image, like what happens if you take several photographs on the same plate.[2] [172]

1 [Condensation is discussed, with numerous examples, in Section A of Chapter VI of *I. of D.*, **4**, 248 ff.]

2 [Freud more than once compared the result of condensation with Francis Galton's 'composite photographs', e.g. *I. of D.*, **4**, 123.]

The production of composite structures like these must be of great importance to the dream-work, since we can show that, where in the first instance the common elements necessary for them were missing, they are deliberately introduced – for instance, through the choice of the words by which a thought is expressed. We have already come across condensations and composite structures of this sort. They played a part in the production of some slips of the tongue. You will recall the young man who offered to '*begleitdigen*' ['*begleiten* (accompany)' + '*beleidigen* (insult)', p. 30 above] a lady. Moreover, there are jokes of which the technique is based on a condensation like this.[1] But apart from these cases, it may be said that the process is something quite unusual and strange. It is true that counterparts to the construction of these composite figures are to be found in some creations of our imagination, which is ready to combine into a unity components of things that do not belong together in our experience – in the centaurs, for instance, and the fabulous beasts which appear in ancient mythology or in Böcklin's pictures. The 'creative' imagination, indeed, is quite incapable of *inventing* anything; it can only combine components that are strange to one another. But the remarkable thing about the procedure of the dream-work lies in what follows. The material offered to the dream-work consists of thoughts – a few of which may be objectionable and unacceptable, but which are correctly constructed and expressed. The dream-work puts these thoughts into another form, and it is a strange and incomprehensible fact that in making this translation (this rendering, as it were, into another script or language) these methods of merging or combining are brought into use. After all, a translation normally endeavours to preserve the distinctions made in the text and particularly to keep things that are similar separate. The dream-work, quite the contrary, tries to condense two different thoughts by seeking out (like a joke) [173] an ambiguous word in which the two thoughts may come together. We need not try to understand this feature all at once, but it may become important for our appreciation of the dream-work.

But although condensation makes dreams obscure, it does not give one the impression of being an effect of the dream censorship. It seems traceable rather to some mechanical or economic factor, but in any case the censorship profits by it.

The achievements of condensation can be quite extraordinary. It is sometimes possible by its help to combine two quite different latent

1 [This technique is discussed, with many examples, in the first section of Chapter II of Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 15 ff.]

trains of thought into one manifest dream, so that one can arrive at what appears to be a sufficient interpretation of a dream and yet in doing so can fail to notice a possible 'overinterpretation'.[1]

In regard to the connection between the latent and the manifest dream, condensation results also in no simple relation being left between the elements in the one and the other. A manifest element may correspond simultaneously to several latent ones, and, contrariwise, a latent element may play a part in several manifest ones – there is, as it were, a criss-cross relationship [cf. p. 109 above]. In interpreting a dream, moreover, we find that the associations to a single manifest element need not emerge in succession: we must often wait till the whole dream has been interpreted.

Thus the dream-work carries out a very unusual kind of transcription of the dream thoughts: it is not a word-for-word or a sign-for-sign translation; nor is it a selection made according to fixed rules – as though one were to reproduce only the consonants in a word and to leave out the vowels; nor is it what might be described as a representative selection – one element being invariably chosen to take the place of several; it is something different and far more complicated.

The second achievement of the dream-work is *displacement*.[2] Fortunately we have made some preliminary examination of this: for we know [174]
that it is entirely the work of the dream censorship. It manifests itself in two ways: in the first, a latent element is replaced not with a component part of itself but with something more remote – that is, with an allusion; and in the second, the psychical accent is shifted from an important element on to another which is unimportant, so that the dream appears differently centred and strange.

Replacing something with an allusion to it is a process familiar in our waking thought as well, but there is a difference. In waking thought the allusion must be easily intelligible, and the substitute must be related in its subject matter to the genuine thing it stands for. Jokes, too, often make use of allusion. They drop the precondition of there being an association in subject matter, and replace it with unusual external[3] associations such as similarity of sound, verbal ambiguity, and so on. But

1 [This is commented on at several points in *I. of D.*, e.g. **5**, 468. An example of such a second interpretation can be found in ibid., **4**, 132.]

2 [Displacement is the subject of Section B of Chapter VI of *I. of D.*, **4**, 272 ff.; but it comes up for discussion at a great many other places in the book.]

3 [An 'external' association is one that is based not on the *meaning* of the two associated words, but on superficial connections (such as similarity of sound) or purely accidental ones.]

they retain the precondition of intelligibility: a joke would lose all its efficiency if the path back from the allusion to the genuine thing could not be followed easily.[1] The allusions employed for displacement in dreams have set themselves free from both of these restrictions. They are connected with the element they replace by the most external and remote relations and are therefore unintelligible; and when they are undone, their interpretation gives the impression of being a bad joke[2] or of an arbitrary and forced explanation dragged in by the hair of its head. For the dream censorship gains its end only if it succeeds in making it impossible to find the path back from the allusion to the genuine thing.

Displacement of accent is unheard of as a method of expressing thoughts. We sometimes make use of it in waking thought in order to produce a comic effect. I can perhaps call up the impression it produces of going astray if I recall an anecdote. There was a blacksmith in a village, who had committed a capital offence. The court decided that the crime
[175] must be punished; but as the blacksmith was the only one in the village and was indispensable, and as on the other hand there were three tailors living there, one of *them* was hanged instead.[3]

The third achievement of the dream-work is psychologically the most interesting. It consists in transforming thoughts into visual images.[4] Let us keep it clear that this transformation does not affect *everything* in the dream thoughts; some of them retain their form and appear as thoughts or knowledge in the manifest dream as well; nor are visual images the only form into which thoughts are transformed. Nevertheless they comprise the essence of the formation of dreams; this part of the dream-work is, as we already know, the second most regular one [p. 113 above], and we have already made the acquaintance of the 'plastic' representation of words in the case of individual dream elements [p. 106].

It is clear that this achievement is not an easy one. To form some idea of its difficulties, let us suppose that you have undertaken the task of replacing a political leading article in a newspaper with a series of illustrations. You will thus have been thrown back from alphabetic writing to picture-writing. Insofar as the article mentioned people and concrete

1 [An account of the 'allusion' technique of jokes with a number of examples appears in Section II of Chapter II of the book on *Jokes* (1905*c*), *RSE*, **8**, 65 ff. The necessity for their being easily intelligible is discussed in ibid., 130 f.]

2 [This is further discussed on p. 206 below.]

3 [This was a favourite anecdote of Freud's. He told it ten years earlier than this in his book on *Jokes* (1905*c*), *RSE*, **8**, 178, and again eight years later in *The Ego and the Id* (1923*b*), ibid., **19**, 40.]

4 [The main discussion of this is in Section C of Chapter VI of *I. of D.*, **4**, 276 ff.]

objects you will replace them easily and perhaps even advantageously with pictures; but your difficulties will begin when you come to the representation of abstract words and of all those parts of speech which indicate relations between thoughts – such as particles, conjunctions and so on. In the case of abstract words you will be able to help yourselves out by means of a variety of devices. For instance, you will endeavour to give the text of the article a different wording, which may perhaps sound less usual but which will contain more components that are concrete and capable of being represented. You will then recall that most abstract words are 'watered-down' concrete ones, and you will for that reason hark back as often as possible to the original concrete meaning of such words. Thus you will be pleased to find that you can represent the 'possession' of an object by a real, physical sitting down on it.[1] And the dream-work does just the same thing. In such circumstances you will scarcely be able to expect very great accuracy from your representation: similarly, you will forgive the dream-work for replacing an element so hard to put into pictures as, for example, 'adultery' ['*Ehebruch*', literally 'breach of marriage'], with another breach – a broken leg ['*Beinbruch*'].[2] [176]

1 [The German word '*besitzen*' ('to possess') is more obviously connected with sitting than its English equivalent ('*sitzen*' = 'to sit'). An example of 'sitting down on' in a dream with the meaning of 'possession' occurred in one of the dreams of 'Little Hans'. See Section II of his case history (1909*b*), *RSE*, **10**, 29 and 30 f.]

2 While I am correcting the proofs of these pages chance has put into my hands a newspaper cutting which offers an unexpected confirmation of what I have written above:

'DIVINE PUNISHMENT

'*A Broken Arm for a Broken Marriage*.

'Frau Anna M., wife of a militiaman, sued Frau Klementine K. for adultery. According to the statement of claim, Frau K. had carried on an illicit relationship with Karl M., while her own husband was at the front and was actually making her an allowance of 70 Kronen a month. Frau K. had already received a considerable amount of money from the plaintiff's husband, while she and her child had to live in hunger and poverty. Fellow soldiers of her husband had informed her that Frau K. had visited taverns with M. and had sat there drinking till far into the night. On one occasion the defendant had asked the plaintiff's husband in the presence of several other soldiers whether he would not get a divorce soon from "his old woman" and set up with her. Frau K.'s caretaker also reported that she had repeatedly seen the plaintiff's husband in the house most incompletely dressed.

'Before a court in the Leopoldstadt [district of Vienna] Frau K. yesterday denied knowing M., so that there could be no question of her having intimate relations with him.

'A witness, Albertine M., stated, however, that she had surprised Frau K. kissing the plaintiff's husband.

'At a previous hearing, M., under examination as a witness, had denied having intimate relations with the defendant. Yesterday the judge received a letter in which the witness withdrew the statements he had made on the earlier occasion and admitted that he had had a love affair with Frau K. up till the previous June. He had only denied his relations with the defendant at the former hearing because she had come to him before the hearing and begged him on her knees to save her and say nothing. "Today", the witness wrote, "I feel compelled to make a full confession to the court, for I have broken my left arm and this seems to me to be a divine punishment for my wrongdoing."

[177] And in this way you will succeed to some extent in compensating for the clumsiness of the picture-writing that is supposed to take the place of the alphabetic script.

For representing the parts of speech which indicate relations between thoughts – 'because', 'therefore', 'however', etc. – you will have no similar aids at your disposal; those constituents of the text will be lost so far as translation into pictures goes. In the same way, the dream-work reduces the content of the dream thoughts to its raw material of objects and activities. You will feel pleased if there is a possibility of in some way hinting, through the subtler details of the pictures, at certain relations not in themselves capable of being represented. And just so does the dream-work succeed in expressing some of the content of the latent dream thoughts by peculiarities in the *form* of the manifest dream – by its clarity or obscurity, by its division into several pieces, and so on. The number of part-dreams into which a dream is divided usually corresponds to the number of main topics or groups of thoughts in the latent dream. A short introductory dream will often stand in the relation of a prelude to a following, more detailed, main dream or may give the motive for it;[1] a subordinate clause in the dream thoughts will be replaced with the interpolation of a change of scene into the manifest dream, and so on. Thus the form of dreams is far from being without significance and itself calls for interpretation. When several dreams occur during the same night, they often have the same meaning and indicate that an attempt is being made to deal more and more efficiently with a stimulus of increasing insistence.[2] In individual dreams a particularly difficult element may be represented by several symbols – by 'doublets'.[3]

[178] If we make a series of comparisons between the dream thoughts and the manifest dreams which replace them, we shall come upon all kinds of things for which we are unprepared: for instance, that nonsense and absurdity in dreams have their meaning. At this point, indeed, the contrast between the medical and the psychoanalytic view of dreams reaches a pitch of acuteness not met with elsewhere. According to the former, dreams are senseless because mental activity in dreams has abandoned all its powers of criticism; according to our view, on the contrary,

'The judge stated that the penal offence had lapsed under the statute of limitations. The plaintiff then withdrew her claim and the defendant was discharged.'

1 [This is discussed, with an example, in *I. of D.*, **4**, 280–2.]

2 [Cf. ibid., 297–8.]

3 [In philology the term is used of two different words with the same etymology: e.g. 'fashion' and 'faction', both from the Latin '*factio*'.]

dreams become senseless when a piece of criticism included in the dream thoughts – a judgement that 'this is absurd' – has to be represented. The dream you are familiar with of the visit to the theatre ('three tickets for 1 florin 50') [p. 107 above] is a good example of this. The judgement it expressed was: 'it was absurd to marry so early'.[1]

Similarly, in the course of our work of interpretation we learn what it is that corresponds to the doubts and uncertainties which the dreamer so often expresses as to whether a particular element occurred in a dream, whether it was this or whether, on the contrary, it was something else. There is as a rule nothing in the latent dream thoughts corresponding to these doubts and uncertainties; they are entirely due to the activity of the dream censorship and are to be equated with an attempt at elimination which has not quite succeeded.[2]

Among the most surprising findings is the way in which the dream-work treats contraries that occur in the latent dream. We know already [p. 149 above] that conformities in the latent material are replaced with condensations in the manifest dream. Well, contraries are treated in the same way as conformities, and there is a special preference for expressing them by the same manifest element. Thus an element in the manifest dream which is capable of having a contrary may equally well be expressing either itself or its contrary or both together: only the sense can decide which translation is to be chosen. This connects with the further fact that a representation of 'no' – or at any rate an unambiguous one – is not to be found in dreams.

A welcome analogy to this strange behaviour of the dream-work is [179] provided for us in the development of language. Some philologists have maintained that in the most ancient languages contraries such as 'strong–weak', 'light–dark', 'big–small' are expressed by the same verbal roots. (What we term 'the antithetical meaning of primal words'.) Thus in ancient Egyptian '*ken*' originally meant 'strong' and 'weak'. In speaking, misunderstanding from the use of such ambivalent words was avoided by differences of intonation and by the accompanying gesture, and in writing, by the addition of what is termed a 'determinative' – a picture which is not itself intended to be spoken. For instance, '*ken*' meaning 'strong' was written with a picture of a little upright man after the alphabetic signs; when '*ken*' stood for 'weak', what followed was the picture

1 [Absurdity in dreams is discussed in Section G of Chapter VI of *I. of D.*, **5**, 380–97.]

2 [Cf. ibid., **5**, 461–2. Doubt as a symptom of obsessional neurosis is discussed in Lecture XVII, Vol. 16, p. 229 f. below.]

of a man squatting down limply. It was only later, by means of slight modifications of the original homologous word, that two distinct representations were arrived at of the contraries included in it. Thus from '*ken*' 'strong–weak' were derived '*ken*' 'strong' and '*kan*' 'weak'. The remains of this ancient antithetical meaning seem to have been preserved not only in the latest developments of the oldest languages but also in far younger ones and even in some that are still living. Here is some evidence of this, derived from K. Abel (1884).[1]

In Latin, words that remained ambivalent in this way are '*altus*' ('high' and 'deep') and '*sacer*' ('sacred' and 'accursed').

As instances of modifications of the same root I may mention '*clamare*' ('to cry'), '*clam*' ('softly', 'quietly', 'secretly'); '*siccus*' ('dry'), '*succus*' ('juice'). And in German: '*Stimme*' ['voice'], '*stumm*' ['dumb'].

If we compare related languages, there are numerous examples. In English, 'to lock'; in German, '*Loch*' ['hole'] and '*Lücke*' ['gap']. In English, 'to cleave'; in German, '*kleben*' ['to stick'].

The English word 'without' (which is really 'with–without') is used today for 'without' alone. 'With', in addition to its combining sense, originally had a removing one; this is still to be seen in the compounds 'withdraw' and 'withhold'. Similarly with the German '*wieder*' ['together with' and '*wider*' 'against'].

[180] Another characteristic of the dream-work also has its counterpart in the development of language. In ancient Egyptian, as well as in other, later languages, the order of the sounds in a word can be reversed, while keeping the same meaning. Examples of this in English and German are: '*Topf*' ['pot']–'pot'; 'boat'–'tub'; 'hurry'–'*Ruhe*' ['rest']; '*Balken*' ['beam']–'*Kloben*' ['log'] and 'club'; 'wait'–'*täuwen*' ['tarry']. Similarly in Latin and German: '*capere*'–'*packen*' ['to seize']; '*ren*'–'*Niere*' ['kidney'].

Reversals like this, which occur here with individual words, take place in various ways in the dream-work. We already know reversal of meaning, replacement of something by its opposite [p. 155 above]. Besides this we find in dreams reversals of situation, of the relation between two people – a 'topsy-turvy' world. Quite often in dreams it is the hare that shoots the sportsman. Or again we find a reversal in the order of events, so that what precedes an event causally comes after it in the dream – like a theatrical production by a third-rate touring company, in which the hero falls down dead and the shot that killed him is not fired in the wings

1 [Freud wrote a long review of Abel's monograph (1910*e*), from which much of what he says here is quoted in a condensed form. He returns to the subject in Lecture XV, p. 200 f. below.]

till afterwards. Or there are dreams where the whole order of the elements is reversed, so that to make sense in interpreting it we must take the last one first and the first one last. You will remember too from our study of dream symbolism that going or falling into the water means the same as coming out of it – that is, giving birth or being born [p. 133 f. above], and that climbing up a staircase or a ladder is the same thing as coming down it [p. 138]. It is not hard to see the advantage that dream distortion can derive from this freedom of representation.

These features of the dream-work may be described as *archaic*. They are equally characteristic of ancient systems of expression by speech and writing and they involve the same difficulties, which we shall have to discuss again later in a critical sense.[1]

And now a few more considerations. In the case of the dream-work it is clearly a matter of transforming the latent thoughts which are expressed in words into sensory images, mostly of a visual sort. Now our thoughts originally arose from sensory images of that kind: their first material and their preliminary stages were sense impressions, or, more [181] properly, mnemic images of such impressions. Only later were words attached to them and the words in turn linked up into thoughts. The dream-work thus submits thoughts to a *regressive* treatment[2] and undoes their development; and in the course of the regression everything has to be dropped that had been added as a new acquisition in the course of the development of the mnemic images into thoughts.

Such then, it seems, is the dream-work. As compared with the processes we have come to know in it, interest in the manifest dream must pale into insignificance. But I will devote a few more remarks to the latter, since it is of it alone that we have immediate knowledge.

It is natural that we should lose some of our interest in the manifest dream. It is bound to be a matter of indifference to us whether it is well put together, or is broken up into a series of disconnected separate pictures. Even if it has an apparently sensible exterior, we know that this has only come about through dream distortion and can have as little organic relation to the internal content of the dream as the façade of an Italian church has to its structure and plan. There are other occasions when this façade of the dream *has* its meaning, and reproduces an important component of the latent dream thoughts with little or no distortion. But we cannot know this before we have submitted the dream to

1 [See Lecture XIII, p. 173 ff. below.]

2 [The subject of 'regression' is discussed at length in Lecture XXII, Vol. 16, p. 299 ff. below.]

interpretation and have been able to form a judgement from it as to the amount of distortion that has taken place. A similar doubt arises when two elements in a dream appear to have been brought into a close relation to each other. This may give us a valuable hint that we may bring together what corresponds to these elements in the latent dream as well; but on other occasions we can convince ourselves that what belongs together in the dream thoughts has been torn apart in the dream.

In general one must avoid seeking to explain one part of the manifest dream by another, as though the dream had been coherently conceived and was a logically arranged narrative. On the contrary, it is as a rule like a piece of breccia, composed of various fragments of rock held together
[182] by a binding medium, so that the designs that appear on it do not belong to the original rocks imbedded in it. And there is in fact one part of the dream-work, known as 'secondary revision',[1] whose business it is to make something whole and more or less coherent out of the first products of the dream-work. In the course of this, the material is arranged in what is often a completely misleading sense and, where it seems necessary, interpolations are made in it.

On the other hand, we must not overestimate the dream-work and attribute too much to it. The achievements I have enumerated exhaust its activity; it can do no more than condense, displace, represent in plastic form and subject the whole to a secondary revision.[2] What appear in the dream as expressions of judgement, of criticism, of astonishment or of inference – none of these is an achievement of the dream-work and they are very rarely expressions of afterthoughts about the dream; they are for the most part portions of the latent dream thoughts which have passed over into the manifest dream with a greater or lesser amount of modification and adaptation to the context. Nor can the dream-work compose speeches. With a few assignable exceptions, speeches in dreams are copies and combinations of speeches which one has heard or spoken oneself on the day before the dream and which have been included in the latent thoughts either as material or as the instigator of the dream.[3] The dream-work is equally unable to carry out calculations. Such of them as appear in the manifest dream are mostly combinations of numbers, sham calculations which are quite senseless qua calculations and are once

1 [This is the subject of Section I of Chapter VI of *I. of D.*, **5**, 437 ff.]

2 [Elsewhere Freud excluded secondary revision from the dream-work. Cf. 'An Evidential Dream' (1913*a*), *RSE*, **12**, 272 and *n.* 2.]

3 [Cf. *I. of D.*, **5**, 374 ff.]

again only copies of calculations in the latent dream thoughts.[1] In these circumstances it is not to be wondered at that the interest which had turned to the dream-work soon tends to move away from it to the latent dream thoughts, which are revealed, distorted to a greater or lesser degree, by the manifest dream. But there is no justification for carrying this shift of interest so far that, in looking at the matter theoretically, one replaces the dream entirely with the latent dream thoughts and makes [183] some assertion about the former which only applies to the latter. It is strange that the findings of psychoanalysis could be misused to bring about this confusion. One cannot give the name of 'dream' to anything other than the product of the dream-work – that is to say, the *form* into which the latent thoughts have been transmuted by the dream-work. [Cf. p. 194 ff. below.]

The dream-work is a process of quite a singular kind, the like of which has not yet become known in mental life. Condensations, displacements, regressive transformations of thoughts into images – such things are novelties whose discovery has already richly rewarded the labours of psychoanalysis. And you can see once more, from the parallels to the dream-work, the connections which have been revealed between psychoanalytic studies and other fields – especially those concerned in the development of speech and thought.[2] You will only be able to form an idea of the further significance of these discoveries when you learn that the mechanism of dream construction is the model of the manner in which neurotic symptoms arise.

I am also aware that we are not yet able to make a survey of the whole of the new acquisitions which these studies have brought to psychology. I will only point out the fresh proofs they have provided of the existence of unconscious mental acts – for this is what the latent dream thoughts are – and what an unimaginably broad access to a knowledge of unconscious mental life we are promised by the interpretation of dreams.

But now the time has no doubt come for me to demonstrate to you from a variety of small examples of dreams what I have been preparing you for in the course of these remarks.

1 [Cf. *I. of D.*, **5**, 370 ff.]

2 [See also some remarks on the construction of jokes on p. 205 f. below.]

LECTURE XII

SOME ANALYSES OF SAMPLE DREAMS

[184] Ladies and Gentlemen, you must not be disappointed if I once again put before you fragments of dream interpretations instead of inviting you to take part in the interpretation of a nice big dream. You will argue that after so many preparations you have a right to it, and you will express your conviction that, after so many thousands of dreams have been successfully interpreted, it should have been possible long since to have brought together a collection of excellent sample dreams on which all our assertions about the dream-work and the dream thoughts could be demonstrated. Just so. But the difficulties that stand in the way of the fulfilment of your wish are too many.

In the first place I must admit that no-one carries on the interpretation of dreams as his main occupation. How does it come about, then, that people do interpret them? Occasionally, with no particular end in view, one may interest oneself in the dreams of an acquaintance, or one may work through one's own dreams for a time in order to train oneself in psychoanalytic work; but for the most part what one has to deal with are the dreams of neurotic patients who are under psychoanalytic treatment. These latter dreams are excellent material and are in no way inferior to those of healthy people; but the technique of the treatment necessitates our subordinating dream interpretation to therapeutic aims, and we have to allow a whole number of dreams to drop after we have extracted something from them that is of service to the treatment.[1] Some dreams that occur during treatment entirely escape any full analysis: since they have arisen out of the great mass of psychical material which is still unknown to us, it is impossible to understand them before the treatment is finished. If I were to report dreams of this kind, it would oblige me to
[185] uncover all the secrets of a neurosis as well; and that will not do for us, since it is precisely to prepare us for the study of the neuroses that we have attacked the problem of dreams.

1 [An account of the reasons for this is given in 'The Handling of Dream Interpretation in Psychoanalysis' (1911*e*), *RSE*, **12**, 83 ff.]

You, however, would be glad to dispense with this material and would prefer to be given an explanation of the dreams of healthy people or of your own dreams. But this cannot be done, on account of their content. It is impossible to submit either oneself or anyone else whose confidence one enjoys to the ruthless exposure that would be involved in a detailed analysis of his dreams, which, as you already know, are concerned with the most intimate part of one's personality. But there is another difficulty in the way apart from that of providing the material. You are aware that dreams present an alien appearance to the dreamer himself, and much more so to anyone who is unacquainted with him personally. Our literature is not poor in good and detailed dream analyses. I myself have published a few within the framework of case histories.[1] Perhaps the best example of the interpretation of a dream is the one reported by Otto Rank [1910*a*] consisting of two interrelated dreams dreamt by a young girl, which occupy about two pages of print: but their analysis extends to seventy-six pages. So I should need something like a whole term to conduct you through a piece of work of the sort. If one takes up any comparatively long and much-distorted dream, one has to give so many explanations of it, to bring up so much material in the way of associations and memories, to follow up so many bypaths, that a lecture about it would be quite confusing and unsatisfactory. I must therefore ask you to be content with what can be had more easily – an account of small pieces of the dreams of neurotic patients, in which it is possible to recognize this or that point in isolation. What is easiest to demonstrate are dream symbols and, after them, some characteristics of the regressive representation in dreams. In the case of each of the dreams that follow, I will indicate why it is that I think it worth reporting.[2]

(1) This dream consisted of only two short pictures: *His uncle was smoking a cigarette although it was a Saturday. – A woman was caressing and fondling him* [the dreamer] *as though he were her child*. [186]

In regard to the first picture the dreamer (a Jew) remarked that his uncle was a pious man who never had done and never could do anything sinful like that. In regard to the woman in the second picture nothing occurred to him except his mother. These two pictures or thoughts must obviously be seen in connection with each other. But how? Since he

1 [The main instances of these are the two dreams in the analysis of 'Dora' (1905*e*), *RSE*, 7, and the childhood dream of the 'Wolf Man' (1918*b*), *RSE*, 17. The latter case history was not actually published until after the delivery of this lecture, though it had already been written.]

2 [Only two of the dreams quoted here (Nos. 6 and 7) are to be found elsewhere. Very large numbers of other examples, mainly of Freud's own dreams, are reported and analysed in *I. of D.*]

expressly disputed the reality of his uncle's action, it is plausible to insert an 'if': 'If my uncle, that pious man, were to smoke a cigarette on a Saturday, then I might let myself, too, be cuddled by my mother.' This clearly means that cuddling with his mother was something impermissible, like smoking on a Saturday to a pious Jew. You will recall that I told you [p. 154 above] that in the course of the dream-work all the relations between the dream thoughts drop out; these are resolved into their raw material and it is the task of the interpretation to reinsert the omitted relations.

(2) As a result of my publications on dreams I have in a sense become a public consultant on matters relating to them, and for many years I have been receiving communications from the most various sources in which dreams are reported to me or submitted to my judgement. I am of course grateful to anyone who adds enough material to the dream to make an interpretation possible or who gives an interpretation himself. The following dream, dreamt by a medical student in Munich and dating from the year 1910, falls into this category. I am bringing it up in order to show you how impossible it is in general to understand a dream till the dreamer has given us his information about it. For I suspect that at bottom you consider that the ideal method of dream interpretation is by filling in the meaning of the symbols and that you would like to discard the technique of obtaining associations to the dream; and I am anxious to disabuse you of this damaging mistake.

'July 13, 1910. Towards morning I had this dream: *I was bicycling down the street in Tübingen when a brown dachshund rushed up behind me and seized me by the heel. After a little I got off, sat down on a step, and began*
[187] *to hit at the beast, which had bitten firm hold of me.* (I had no disagreeable feelings either from the bite or from the scene as a whole.) *Some elderly ladies were sitting opposite me and grinning at me. Then I woke up and, as has often happened before, at the moment of transition to waking, the whole dream was clear to me.*'

Symbols are of little help here. But the dreamer reported: 'I have recently fallen in love with a girl, but only from seeing her in the street, and I have had no means of getting in contact with her. The dachshund might have been the pleasantest way of doing so, especially as I am a great animal lover and I liked this same characteristic in the girl.' He added that he had repeatedly intervened in furious dog fights with great skill and often to the astonishment of the onlookers. We learn then that the girl he was attracted to was always to be seen in the company of this

particular dog. As far as the manifest dream was concerned, however, the girl was omitted and only the dog associated with her was left. The elderly ladies who grinned at him may perhaps have taken the girl's place. His further remarks threw no adequate light on this point. The fact that he was bicycling in the dream is a direct repetition of the remembered situation. He never met the girl with the dog except when he was on his bicycle.

(3) When anyone has lost someone near and dear to him, he produces dreams of a special sort for some time afterwards, in which knowledge of the death arrives at the strangest compromises with the need to bring the dead person to life again. In some of these dreams the person who has died is dead and at the same time still alive, because he does not know he is dead; only if he did know would he die completely. In others, he is half dead and half alive, and each of these states is indicated in a particular way. We must not describe these dreams as simply nonsensical; for being brought to life again is no more inconceivable in dreams than it is, for instance, in fairy tales, in which it occurs as a very usual event. So far as I have been able to analyse such dreams, it has turned out that they are capable of a reasonable solution, but that the pious wish to bring the dead person back to life has been able to operate by the strangest means. I will now put before you a dream of this kind which sounds sufficiently peculiar and senseless and the analysis of which will show you much for which our theoretical discussions will have prepared you. It is the dream [188] of a man who had lost his father several years before:

His father was dead but had been exhumed and looked bad. He had been living since then and the dreamer was doing all he could to prevent him noticing it. (The dream then went on to other and apparently very remote matters.)

His father was dead; we know that. His having been exhumed did not correspond to reality; and there was no question of reality in anything that followed. But the dreamer reported that, after he had come away from his father's funeral, one of his teeth began to ache. He wanted to treat the tooth according to the precept of Jewish doctrine: 'If thy tooth offend thee, pluck it out!' And he went off to the dentist. But the dentist said: 'One doesn't pluck out a tooth. One must have patience with it. I'll put something into it to kill it; come back in three days and I'll take it out.'

'That "take out",' said the dreamer suddenly, 'that's the exhuming!'

Was the dreamer right about this? It only fits more or less, not

completely; for the *tooth* was not taken out, but only something in it that had died. But inaccuracies of this kind can, on the evidence of other experiences, well be attributed to the dream-work. If so, the dreamer had condensed his dead father and the tooth that had been killed but retained; he had fused them into a unity. No wonder, then, that something senseless emerged in the manifest dream, for, after all, not everything that was said about the tooth could fit his father. Where could there possibly be a *tertium comparationis* [p. 133 above] between the tooth and his father, to make the condensation possible?

But no doubt he must have been right, for he went on to say that he knew that if one dreams of a tooth falling out it means that one is going to lose a member of one's family.

This popular interpretation, as we know,[1] is incorrect or at least is correct only in a scurrilous sense. We shall be all the more surprised to find the topic thus touched upon reappearing behind other portions of the dream's content.

The dreamer now began, without any further encouragement, to talk
[189] about his father's illness and death as well as about his own relations with him. His father was ill for a long time, and the nursing and treatment had cost him (the son) a lot of money. Yet it was never too much, he was never impatient, he never wished that after all it might soon come to an end. He was proud of his truly Jewish filial piety towards his father, of his strict obedience to Jewish Law. And here we are struck by a contradiction in the thoughts belonging to the dream. He had identified the tooth and his father. He wanted to proceed with the tooth in accordance with Jewish Law, which commanded him to pluck it out if it caused him pain or offence. He also wanted to proceed with his father, too, in accordance with the precepts of the Law, but in this case it commanded him to spare no expense or trouble, to take every burden on himself and to allow no hostile intention to emerge against the object that was causing him pain. Would not the two attitudes have agreed much more convincingly if he had really developed feelings towards his sick father similar to those towards his sick tooth – that is, if he had wished that an early death would put an end to his unnecessary, painful and costly existence?

I do not doubt that this was really his attitude towards his father during the tedious illness and that his boastful assurances of his filial piety were meant to distract him from these memories. Under such conditions the death wish against a father is apt to become active and to hide itself under the mask of such sympathetic reflections as that 'it would be a happy

1 [See pp. 137 and 143 f. above.]

release for him'. But please observe that here we have passed a barrier in the latent dream thoughts themselves. No doubt the first portion of them was unconscious only temporarily – that is, during the construction of the dream; but his hostile impulses against his father must have been permanently unconscious.[1] They may have originated from scenes in his childhood and have occasionally slipped into consciousness, timidly and disguised, during his father's illness. We can assert this with greater certainty of other latent thoughts which have made unmistakable contributions to the content of the dream. Nothing, indeed, is to be discovered in the dream of his hostile impulses [*Regungen*] towards his father. But if we look for the roots of such hostility to a father in childhood, we shall recall that fear of a father is set up because, in the very earliest years, he [190]
opposes a boy's sexual activities, just as he is bound to do once more from social motives after the age of puberty. This relation to his father applies to our dreamer as well: his love for him included a fair admixture of awe and anxiety [*Angst*][T], which had their source in his having been early deterred by threats from sexual activity.

The remaining phrases in the manifest dream can be explained now in relation to the masturbation complex. '*He looked bad*' is indeed an allusion to another remark of the dentist's to the effect that it looks bad if one has lost a tooth in that part of the mouth; but it relates at the same time to the 'looking bad' by which a young man at puberty betrays, or is afraid he betrays, his excessive sexual activity. It was not without relief to his own feelings that in the manifest content the dreamer displaced the 'looking bad' from himself on to his father – one of the kinds of reversal by the dream-work which is familiar to you [p. 156 above]. '*He had been living since then*' coincides with the wish to bring back to life as well as with the dentist's promise that the tooth would survive. The sentence 'the dreamer was doing all he could *to prevent him* (*his father*) *noticing it*' is very subtly devised to mislead us into thinking that it should be completed by the words 'that he was dead'. The only completion, however, that makes sense comes once more from the masturbation complex; in that connection it is self-evident that the young man did all he could to conceal his sexual life from his father. And finally, remember that we must always interpret what are called 'dreams with a dental stimulus' as relating to masturbation and the dreaded punishment for it. [Cf. footnote, p. 164 above.]

You can see now how this incomprehensible dream came about. It was done by producing a strange and misleading condensation, by

1 [This is carried further at the end of Lecture XIII, p. 184 below.]

disregarding all the thoughts that were in the centre of the latent thought process and by creating ambiguous substitutes for the deepest and chronologically most remote of those thoughts.[1]

[191] (4) We have already tried repeatedly to come to understand the matter-of-fact and commonplace dreams which have nothing senseless or strange about them but which raise the question of why one should dream about such indifferent stuff. [Cf. pp. 85 and 102 f. above.] I will therefore offer you another example of this kind – three interconnected dreams dreamt by a young lady in one night.

(*a*) *She was walking across the hall of her house and struck her head against a low-hanging chandelier and drew blood.*

No reminiscence, nothing that had really happened. The information she produced in response to it led in quite other directions. 'You know how badly my hair's falling out. "My child," my mother said to me yesterday, "if this goes any further you'll have a head as smooth as a bottom."' So here the head stands for the other end of the body. We can understand the chandelier, without any help, as a symbol: all objects capable of being lengthened are symbols of the male organ [p. 135 above]. It was therefore a matter of bleeding at the lower end of the body, which had arisen from contact with a penis. This might still be ambiguous. Her further associations showed that what was in question concerned a belief that menstrual bleeding arises from sexual intercourse with a man – a piece of sexual theory which counts many faithful believers among immature girls.

(*b*) *She saw a deep pit in the vineyard, which she knew had been caused by a tree being torn out*. She added a remark that the tree *was missing*. She meant that she had not seen the tree in her dream; but the same wording served to express another thought which made the symbolic interpretation quite certain. The dream referred to another piece of infantile sexual theory – to the belief that girls originally had the same genitals as boys and that their later shape was the result of castration (the tearing out of a tree).

(*c*) *She was standing in front of the drawer of her writing table which she was so familiar with that she could tell at once if anyone had been into it*. Like all drawers, chests and cases, the writing-table drawer stood for the female genitals [p. 136 above]. She knew that indications of sexual

1 [A fragment of a dream very similar, if not identical, to this one is discussed in *I. of D.*, **5**, 384, as well as in 'Formulations on the Two Principles of Mental Functioning' (1911*b*), *RSE*, **12**, 221.]

intercourse (and, as she thought, of touching) could be observed on the genitals and had long feared such a discovery. In all these three dreams, I think, the accent is to be placed on *knowledge*. She was recalling the period of her sexual researches when she was a child, of whose outcome she had been quite proud at the time.[1] [192]

(5) Here is a little more symbolism. But this time I must start with a short preamble on the psychical situation. A gentleman who had passed a night in intercourse with a lady described her as one of those motherly characters in whom the wish for a child breaks irresistibly through in intercourse with a man. The circumstances of this meeting, however, called for a precaution which prevented the fertilizing semen from reaching the woman's uterus. On waking up after this night the woman reported the following dream:

An officer in a red cap was running after her in the street. She fled from him, and ran up the stairs with him still after her. Breathless, she reached her flat, slammed the door behind her and locked it. He stayed outside, and when she looked through the peep-hole, he was sitting on a bench outside and weeping.

You will no doubt recognize the pursuit by the officer in the red cap and the breathless climbing upstairs as representing the sexual act [p. 138 above]. The fact that it was the dreamer who locked herself up against her pursuer will serve as an example of the reversals that are used so commonly in dreams [p. 156 f.], for it was the man who had avoided the consummation of the sexual act. In the same way, her grief was displaced on to the man, for it was he who wept in the dream – and this was simultaneously a representation of the emission of semen.

I feel sure that you have heard some time or other that it is asserted by psychoanalysis that every dream has a sexual meaning. Well, you yourselves are in a position to form a judgement of the incorrectness of this reproach. You have become acquainted with wishful dreams dealing with the satisfaction of the most obvious needs – hunger and thirst and the longing for freedom – with dreams of convenience and of impatience, and also with purely covetous and egoistic dreams. But at the same time you should bear in mind, as one of the results of psychoanalytic research, that greatly distorted dreams give expression mainly (though, again, not exclusively) to sexual wishes.

1 [The sexual researches and sexual theories of children are discussed in Lecture XX, Vol. 16, p. 279 below.]

[193] (6) I have a particular reason [*Motiv*] for piling up instances of the use of symbols in dreams. At our first meeting [p. 16 ff. above] I lamented the difficulty of providing demonstrations and so of carrying conviction in giving instruction in psychoanalysis. And I have no doubt that you have since come to agree with me. But the different theses of psychoanalysis are so intimately connected that conviction can easily be carried over from a single point to a larger part of the whole. It might be said of psychoanalysis that if anyone holds out a little finger to it it quickly grasps his whole hand. No-one, even, who has accepted the explanation of parapraxes can logically withhold his belief in all the rest. A second, equally accessible position is offered by dream symbolism. Here is the dream of an uneducated woman whose husband was a policeman and who had certainly never heard anything about dream symbolism or psychoanalysis. Then judge for yourselves whether its explanation by the help of sexual symbols can be called arbitrary and forced:

'. . . *Then someone broke into the house and she was frightened and called out for a policeman. But he had gone into a church, to which a number of steps led up, accompanied amicably by two tramps. Behind the church there was a hill and above it a thick wood. The policeman was dressed in a helmet, gorget and cloak. He had a brown beard. The two tramps, who went along peaceably with the policeman, had sack-like aprons tied round their middles. In front of the church a path led up to the hill; on both sides of it there grew grass and brushwood, which became thicker and thicker and, at the top of the hill, turned into a regular wood.*'[1]

You will have no trouble in recognizing the symbols used. The male genitals are represented by a triad of figures, and the female ones by a landscape with a chapel, hill and wood. Once again you find steps as a symbol for the sexual act. What is called a hill in the dream is also called one in anatomy – the Mons Veneris [the hill of Venus].

(7) And here is yet another dream that must be solved by the insertion of symbols. It is notable and convincing from the fact that the dreamer himself translated all the symbols, though he had no sort of previous
[194] theoretical knowledge of dream interpretation. Such an attitude is quite unusual and its determinants are not precisely understood:[2]

'*He was going for a walk with his father in a place which must certainly*

1 [This dream, originally reported by B. Dattner, appears in *I. of D.*, **5**, 327, in a very slightly different version.]

2 [Cf. some remarks on this in *I. of D.*, **5**, 313 f.]

have been the Prater,[1] *since he saw the Rotunda, with a small annex in front of it to which a captive balloon was attached, though it looked rather limp. His father asked him what all this was for; he was surprised at his asking, but explained it to him. Then they came into a courtyard which had a large sheet of tin laid out in it. His father wanted to pull off a large piece of it, but first looked around to see if anyone was watching. He told him that he need only tell the foreman and he could take some without any bother. A staircase led down from this yard into a shaft, whose walls were cushioned in some soft material, rather like a leather armchair. At the end of the shaft was a longish platform and then another shaft started. . . .*'

The dreamer himself interpreted: 'The Rotunda was my genitals and the captive balloon in front of it was my penis, whose limpness I have reason to complain of.' Going into greater detail, then, we may translate the Rotunda as the bottom (habitually regarded by children as part of the genitals) and the small annex in front of it as the scrotum. His father asked him in the dream what all this was – that is, what was the purpose and function of the genitals. It seemed plausible to reverse this situation and turn the dreamer into the questioner. Since he had in fact never questioned his father in this way, we had to look upon the dream thought as a wish, or take it as a conditional clause, such as: 'If I had asked my father for sexual enlightenment. . . .' We shall presently find the continuation of this thought in another part of the dream.

The courtyard in which the sheet of tin was spread out is not to be taken symbolically in the first instance. It was derived from the business premises of the dreamer's father. For reasons of discretion I have substituted 'tin' for another material in which his father actually dealt: but I have made no other change in the wording of the dream. The dreamer had entered his father's business and had taken violent objection to the somewhat dubious practices on which the firm's earnings in part depended. Consequently the dream thought I have just interpreted may have continued in this way: '(If I had asked him), he would have [195] deceived me just as he deceives his customers.' As regards the 'pulling off' which served to represent his father's dishonesty in business, the dreamer himself produced a second explanation – namely that it stood for masturbating. Not only have we long been familiar with this interpretation [p. 143 above], but there was something to confirm it in the fact that the secret nature of masturbation was represented by its reverse: it might be done openly. Just as we should expect, the

1 [The 'Bois de Boulogne' of Vienna. It includes an amusement park.]

masturbatory activity was once again displaced on to the dreamer's father, like the questioning in the first scene of the dream. He promptly interpreted the shaft as a vagina, having regard to the soft cushioning of its walls. I added on my own authority [p. 138 above] that climbing down, like climbing up in other cases, described sexual intercourse in the vagina.

The dreamer himself gave a biographical explanation of the further details – that the first shaft was followed by a longish platform and then by another shaft. He had practised intercourse for a time but had then given it up on account of inhibitions, and he now hoped to be able to resume it by the help of the treatment.[1]

(8) The two following dreams were dreamt by a foreigner of a highly polygamous disposition. I repeat them to you as evidence for my assertion [p. 124 f. above] that the dreamer's own ego appears in every dream even if it is concealed in the manifest content. The trunks in the dreams were symbols of women:

(*a*) *He was starting on a journey; his luggage was taken to the station on a carriage, a number of trunks piled up on it, and among them two big black ones, like boxes of samples. He said to someone consolingly: 'Well, they're only going with me as far as the station.'*

He did in fact travel with a great deal of luggage; but he also brought a great many stories about women into the treatment. The two black trunks corresponded to two dark[2] women who were at the time playing the main part in his life. One of them had wanted to follow him to Vienna; and on my advice he had telegraphed to put her off.

[196] (*b*) A scene at the customs house: *Another traveller opened his box and, coolly smoking a cigarette, said: 'There's nothing in it.' The customs officer seemed to believe him, but felt about once more inside it, and found something quite particularly prohibited. The traveller said in a resigned voice: 'There's nothing to be done about it.'*

He himself was the traveller: I was the customs officer. As a rule he was very straightforward in making admissions; but he had intended to keep silent to me about a new connection he had formed with a lady, because he rightly supposed that she was not unknown to me. He displaced the distressing situation of being detected on to a stranger, so that he himself did not seem to appear in the dream.

1 [This dream and its analysis are reprinted almost exactly from *I. of D.*, **5**, 325–7.]

2 [In German, '*schwarz*' ('black').]

(9) Here is an example of a symbol which I have not yet mentioned:

He met his sister in the company of two women friends who were themselves sisters. He shook hands with both of them but not with his sister.

No connection with any real occurrence. But his thoughts took him back, rather, to a period in which his observations led him to reflect on how late girls' breasts developed. So the two sisters were breasts; he would have liked to take hold of them with his hand – if only it were not his sister.

(10) Here is an example of death symbolism in a dream:

He was walking, with two people whose names he knew but had forgotten when he woke up, across a very high, steep iron bridge. Suddenly they had both gone, and he saw a ghost-like man in a cap and linen clothes. He asked him if he was the telegraph boy. No. Was he the driver? No. Then he walked on further. . . . While he was still dreaming he felt acute anxiety, and after he had woken up he continued the dream with a phantasy that the iron bridge suddenly broke and he fell into the abyss.

People of whom one insists that they are unknown or that one has forgotten their names are mostly people very near to one. The dreamer had a brother and sister; and if he had wished that these two were dead, it would be only fair that in return *he* should be victimized by a fear of death. Of the telegraph boy he remarked that such people always bring bad news. By his uniform he might equally have been the lamp lighter; but he puts out the lamps as well, just as the Spirit of Death puts out the [197]
torch. The driver made him think of Uhland's poem about King Charles's Voyage, and reminded him of a dangerous sea voyage with two companions during which he had played the part of the King in the poem.[1] The iron bridge made him think of a recent accident and of the foolish saying: 'Life is a suspension bridge'.[2]

(11) The following dream may count as another representation of death:

An unknown gentleman left a black-edged visiting card on him.

1 [In Uhland's poem, 'König Karls Meerfahrt', King Charles and his twelve knights are overtaken by a storm on a voyage to the Holy Land. The twelve knights express their uneasiness in turn – but the King sits silently at the helm and steers the ship to safety.]

2 [This is quoted as an example of a bad joke in a footnote added in 1912 to Freud's book on *Jokes* (1905*c*), *RSE*, **8**, 121 *n.*]

(12) You will be interested in the following dream in a number of ways, though a neurotic state in the dreamer was one of its preconditions:

He was travelling on a railway train. The train came to a stop in open country. He thought there was going to be an accident and that he must think of getting away. He went through all the coaches on the train and killed everyone he met – the guard, the engine driver, and so on.

In connection with this he thought of a story told him by a friend. A lunatic was being conveyed in a compartment on an Italian line, but through carelessness a traveller was allowed in with him. The madman killed the other traveller. Thus he was identifying himself with the madman, and based his right to do so on an obsession [*Zwangsvorstellung*] by which he was tormented from time to time that he must 'get rid of all accessory witnesses'. But then he himself found a better reason, and this led to the precipitating cause of the dream. At the theatre the night before he had once more seen the girl whom he had wanted to marry but had withdrawn from because she had given him ground for being jealous. In view of the intensity reached by his jealousy he would, he thought, really be mad to want to marry her. This meant that he regarded her as so untrustworthy that, in his jealousy, he would have to kill everyone who came his way. We have already come across
[198] walking through a series of rooms (here, railway coaches) as a symbol of marriage (a reversal of 'monogamy').[1]

In connection with the train coming to a stop in open country and his being afraid of an accident, he said that once when he was on a railway journey there had been a sudden stop of this kind when they were not in a station. A young lady who was travelling with him had said that there might be going to be a collision and that the safest thing to do was to lift one's legs up high. But this 'lifting the legs high' had also played a part in the many walks and excursions in the country which he had taken with the other girl in the happy early days of their love. This was a fresh argument for thinking he would be mad to marry her now. But my knowledge of the situation made me feel certain that he nevertheless wished he were mad enough to do it.

1 [This symbol had not been mentioned earlier in these lectures. But in *I. of D.*, **5**, 316 f., it is stated that a suite of rooms can stand for a brothel or a harem, or alternatively (by reversal) for a monogamous marriage.]

LECTURE XIII

THE ARCHAIC FEATURES AND INFANTILISM OF DREAMS

Ladies and Gentlemen, let us start out once more from the conclusion we [199]
arrived at that the dream-work, under the influence of the dream censorship, transposes the latent dream thoughts into a different mode of expression. The latent thoughts do not differ from our familiar conscious thoughts of waking life. The new mode of expression is incomprehensible to us owing to many of its features. We have said that it harks back to states of our intellectual development which have long since been superseded – to picture language, to symbolic connections, to conditions, perhaps, which existed before our thought language had developed. We have on that account described the mode of expression of the dream-work as *archaic* or *regressive* [p. 156 f. above].

You may conclude from this that if we study the dream-work further we must succeed in gaining valuable light on the little-known beginnings of our intellectual development. I hope it will be so; but this work has not so far been started upon. The prehistory into which the dream-work leads us back is of two kinds – on the one hand, into the individual's prehistory, his childhood, and on the other, insofar as each individual somehow recapitulates in an abbreviated form the entire development of the human race, into phylogenetic prehistory too. Shall we succeed in distinguishing which portion of the latent mental processes is derived from the individual prehistoric period and which portion from the phylogenetic one? It is not, I believe, impossible that we shall. It seems to me, for instance, that symbolic connections, which the individual has never acquired by learning, may justly claim to be regarded as a phylogenetic heritage.

This, however, is not the only archaic characteristic of dreams. You are all familiar, of course, from your own experience, with the remarkable amnesia of childhood. I mean the fact that the earliest years of life, up to the age of five, six or eight, have not left behind them traces in our [200]
memory like later experiences. Here and there, it is true, we come upon people who can boast of a continuous memory from the first beginnings

to the present day; but the other alternative, of gaps in the memory, is by far the more frequent. There has not, in my opinion, been enough astonishment over this fact. By the time a child is two he can speak well, and soon shows that he is at home in complicated mental situations; and he makes remarks which, if they are reported to him many years later, he himself will have forgotten. Moreover, the memory is more efficient at an early age, since it is less overburdened than it is later. Nor is there any reason for regarding the function of memory as a particularly high or difficult mental activity; on the contrary, we can find a good memory in people of very low intellectual standing.[1]

A second remarkable fact to which I must draw your attention, and which comes on top of the first one, is that out of the void of memories that covers the earliest years of childhood there stand out a few well-preserved recollections, mostly perceived in plastic form, which cannot justify their survival. Our memory deals with the material of the impressions which impinge on us in later life by making a selection among them. It retains what is of any importance and drops what is unimportant. But this is not true of the childhood memories that have been retained. They do not necessarily correspond to the important experiences of childhood years, nor even to those which must have seemed important from the child's point of view. They are often so commonplace and insignificant that we can only ask ourselves in astonishment why this particular detail has escaped oblivion. I attempted long ago, with the help of analysis, to attack the enigma of childhood amnesia and of the residual memories which interrupt it, and I arrived at the conclusion that even in the case of children it is true in spite of everything that only what is important remains in the memory. But through the processes, already familiar to you, of condensation and more especially of displacement, what is important is replaced in memory by something else which appears unimportant. For this reason I have called these childhood
[201] memories 'screen memories' [*Deckerinnerungen*][T], and with a thorough analysis everything that has been forgotten can be extracted from them.[2]

In psychoanalytic treatments we are invariably faced with the task of filling in these gaps in the memory of childhood; and insofar as the treatment is to any extent successful – that is to say, extremely frequently – we also succeed in bringing to light the content of these forgotten years of childhood. Those impressions had never been really forgotten,

1 [A longer discussion of infantile amnesia can be found in the second of the *Three Essays* (1905*d*), *RSE*, **7**, 155 f.]

2 [Screen memories had been discussed by Freud in Chapter IV of *PEL*, 38 ff., as well as in a separate paper on the subject published earlier (1899*a*), *RSE*, **3**, 301.]

they were only inaccessible, latent, and had formed part of the unconscious. But it can come about that they emerge from the unconscious spontaneously, and this happens in connection with dreams. It appears that dream life knows how to find access to these latent, infantile experiences. Excellent examples of this have been reported in the literature and I myself have been able to provide a contribution of the kind. I once dreamt in a certain connection of a person who must have done me a service and whom I saw clearly before me. He was a one-eyed man of small stature, stout, and with his head sunk deep in his shoulders. I concluded from the context that he was a doctor. Luckily I was able to enquire from my mother, who was still alive, what the doctor at my birthplace (which I had left when I was three) had looked like; and I learnt from her that he was one-eyed, short, stout and with his head sunk deep in his shoulders; and I also learnt what the accident was for which he had come to my help and which I myself had forgotten.[1] This fact of dreams having at their disposal the forgotten material of the first years of childhood is thus a further archaic feature.[2]

This same piece of information can be further applied to another of the riddles we have come up against. You recall the amazement which was caused by our discovery that what instigates dreams are actively evil and extravagantly sexual wishes, which have made the censorship and distortion of dreams necessary [p. 124 ff. above]. When we have interpreted a dream of this sort to the dreamer and if, to take the most favourable case, [202]
he does not actually attack the interpretation, he nevertheless regularly raises the question of where these wishes come from, since they feel alien to him and their opposite is what he is conscious of. We need have no hesitation in pointing out their origin. These evil wishful impulses arise from the past, and often from a past that is not very remote. It can be shown that there was a time when they were familiar and conscious, even if they are no longer so today. A woman, whose dream meant that she would like to see her only daughter, now seventeen years old, dead before her eyes,[3] found under our guidance that she had indeed at one time harboured this death wish. The child was the fruit of an unhappy

1 [The dream is described in *I. of D.*, **4**, 15, where further references can be found. The accident itself is described in ibid., **5**, 501.]

2 [This fact had been noted by Freud in a letter to Fliess of March 10, 1898 (Freud, 1950*a*, Letter 84).]

3 [This dream is described at greater length in *I. of D.*, **4**, 136–7, and referred to again in ibid., 221. In these passages the girl's age is given three times (in letters) as 'fifteen'. The '17' (in figures) in all the German editions of the present work is perhaps due to a misprint.]

marriage which was soon dissolved. Once, while she still bore her daughter in her womb, in a fit of rage after a violent scene with her husband she had beaten with her fists on her body in order to kill the child inside it. How many mothers, who love their children tenderly, perhaps overtenderly, today, conceived them unwillingly and wished at that time that the living thing within them might not develop further! They may even have expressed that wish in various, fortunately harmless, actions. Thus their death wish against someone they love, which is later so mysterious, originates from the earliest days of their relationship to that person.

In the same way, a father had a dream which justified the interpretation that he wished for the death of his favourite eldest child. He too was led to remember that there had been a time when this wish was not strange to him. When the child was still an infant in arms, the father, discontented with his choice of a wife, often thought that, if the little creature, who meant nothing to him, were to die, he would be free once more and would make better use of his freedom.[1] The same origin can be shown in
[203] the case of a great number of similar impulses of hatred; they are recollections of something belonging to the past, which was once conscious and played its part in mental life. You will be inclined to conclude from this that such wishes and such dreams ought not to arise in cases where transformations of this kind in one's relation to someone never occurred, where the relation was of the same kind from the first. I am prepared to admit this; but I must remind you that what you must take into consideration is not the *wording* of the dream but its sense after it has been interpreted. It is possible that a manifest dream of the death of someone loved has merely assumed a horrifying mask and may mean something quite different, or that the loved person is intended as a misleading substitute for someone else.

But the same subject will suggest another and far more serious question. 'Even if', you will say, 'this death wish was present at one time and is confirmed by recollection, that is still no explanation. After all, it was superseded long ago, and can only be present today in the unconscious as no more than an unemotional memory, not as a powerful impulse. Nothing speaks in favour of this last possibility. Why, then, was it recollected at all in the dream?' This question may justly be raised. An attempt to answer it would lead us too far and would necessitate our taking up a position on one of the most important points in the theory of dreams. But I am obliged to keep within the framework of our

1 [What appears to be the same story as this is told in much greater detail in connection not with a dream but with a 'bungled action' near the end of Chapter VIII of *PEL*, 161–2.]

discussions and to exercise restraint. So prepare yourselves for a provisional renunciation.[1] Let us content ourselves with the factual evidence that this superseded wish can be shown to be the instigator of the dream, and let us pursue our enquiry whether other evil wishes can be similarly traced back to the past.

We will keep to wishes for getting rid of someone, which may for the most part be attributed to the dreamer's unrestricted egoism [*Egoismus*]. A wish of this kind can very often be pointed to as the constructor of a dream. Whenever anyone in the course of one's life gets in one's way – and how often this must happen in view of the complication of one's relationships in life! – a dream is promptly ready to kill that person, even if it be father or mother, brother or sister, husband or wife. This [204]
wickedness of human nature came as a great surprise to us and we were decidedly disinclined to accept this outcome of dream interpretation without question. But as soon as we were led to look for the origin of these wishes in the past, we discovered the period of the individual's past in which there was no longer anything strange in such egoism and such wishful impulses, directed even against his closest relatives. It is children, and precisely in those earliest years which are later veiled by amnesia, who often exhibit this egoism to an extremely marked degree and who invariably show clear rudiments or, more correctly speaking, residues of it. Children love themselves first, and it is only later that they learn to love others and to sacrifice something of their own ego [*Ich*] to others. Even those people whom a child seems to love from the beginning are loved by him at first because he needs them and cannot do without them – once again from egoistic motives. Not until later does the impulse to love make itself independent of egoism. It is literally true that *his egoism has taught him to love*.

In this connection it will be interesting to compare the child's attitude to his brothers and sisters with that towards his parents. A small child does not necessarily love his brothers and sisters; often he obviously does not. There is no doubt that he hates them as his competitors, and it is a familiar fact that this attitude often persists for long years, till maturity is reached or even later, without interruption. Quite often, it is true, it is succeeded, or let us rather say overlaid, by a more affectionate attitude; but the hostile one seems very generally to be the earlier. This hostile attitude can be observed most easily in children between two and a half and four or five, when a new baby brother or sister appears. It usually

1 [Freud returns to this problem at the end of the present lecture (p. 184 f. below).]

meets with a very unfriendly reception. Such remarks as 'I don't like him; the stork can take him away again!' are quite common. After this, every opportunity is taken of disparaging the new arrival and attempts to injure him and even murderous assaults are not unknown. If the difference in age is less, by the time the child's mental activity has awakened to some degree of intensity he finds his competitor already there and adjusts himself to him. If the difference is greater, the new baby may from the first arouse a certain sympathy as an interesting object, a sort of live doll;
[205] and where the difference in age is of eight or more years, solicitous, maternal impulses may already come into play, especially in girls. But, honestly speaking, if one comes upon a wish for the death of a brother or sister behind a dream, there is seldom need to find it puzzling and one can trace its prototype without any trouble in early childhood and often enough in later years of companionship as well.[1]

There is probably no nursery without violent conflicts between its inmates. The motives [*Motive*] for these are rivalry for parental love, for common possessions, for living space. The hostile impulses are directed against older as well as against younger members of the family. It was, I believe, Bernard Shaw who remarked: 'As a rule there is only one person an English girl hates more than she hates her mother; and that's her eldest sister.'[2] But there is something in this remark that strikes us as strange. We might at a pinch find hatred and competition with brothers and sisters intelligible. But how can we suppose that feelings of hatred can make their way into the relation between daughter and mother, between parents and children?

This relation is undoubtedly a more favourable one, from the children's point of view as well. That is what our expectations demand; we find an absence of love far more repellent between parents and children than between brothers and sisters. In the former case we have, as it were, made something sacred which in the latter we have left profane. Yet daily observation can show us how frequently the emotional relations between parents and their grown-up children fall behind the ideal set up by society, how much hostility is ready to hand and would be expressed if it were not held back by admixtures of filial piety and affectionate impulses. The motives for this hostility are generally known and their tendency is to divide those of the same sex – the daughter from the mother and the father from the son. The daughter finds in her mother

1 [The relations between brothers and sisters are discussed with examples in Section D of Chapter V of *I. of D.*, **4**, 222–7.]

2 [John Tanner in *Man and Superman*, Act II.]

the authority which restricts her will and which is entrusted with the task of imposing on her the renunciation of sexual freedom which society demands; in a few instances she even finds in her a competitor who struggles against being supplanted. The same thing is repeated between [206] the son and his father still more glaringly. In the son's eyes his father embodies every unwillingly tolerated social restraint; his father prevents him from exercising his will, from early sexual pleasure and, where there is common property in the family, from enjoying it. In the case of an heir to the throne this waiting for a father's death reaches an almost tragic height. There seems less danger to the relation between father and daughter or mother and son. This last provides the purest examples of an unchangeable affection, unimpaired by any egoistic considerations.[1]

Why am I speaking of these things, which are after all commonplaces and universally known? Because there is an unmistakable inclination to disavow their importance in life and to make out that the ideal demanded by society is fulfilled far more often than it really is. It is better, however, that the truth should be told by psychologists rather than that the task should be left to cynics. And, incidentally, this disavowal applies only to real life. Narrative and dramatic works of the imagination may freely make play with the themes that arise from a disturbance of this ideal.

There is no need to feel surprised, therefore, if, in a large number of people, dreams disclose their wish to get rid of their parents and especially of the parent of their own sex. We may assume that this wish is also present in waking life and is even conscious sometimes, if it can be masked by some other motive, as was the case with our dreamer in Example 3 [p. 164 f. above], where it was replaced with pity for his father's useless sufferings. It is rarely that the hostility alone dominates the relationship; far oftener it is in the background of more affectionate impulses by which it is suppressed, and it must wait until a dream isolates it, as it were. What seems to us of enormous size in a dream, on account of this isolation, shrinks up once more when our interpretation has given it its place in the context of real life (Hanns Sachs).[2] But we come upon this dream wish, too, where it has no relevance in real life, and where the [207] adult need never confess to it in his waking life. The reason for this is that the deepest and most invariable motive for estrangement, especially

1 [This point is discussed at greater length in Lecture XXXIII of the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 117 f.]

2 [The actual words used by Sachs (1912, 569) were quoted by Freud in a passage which he inserted in 1914 on almost the last page of *I. of D.*, **5**, 554.]

between two people of the same sex, has already made itself felt in early childhood.

What I have in mind is rivalry in love, with a clear emphasis on the subject's sex. While he is still a small child, a son will already begin to develop a special affection for his mother, whom he regards as belonging to him; he begins to feel his father as a rival who disputes his sole possession. And in the same way a little girl looks on her mother as a person who interferes with her affectionate relation to her father and who occupies a position which she herself could very well fill. Observation shows us to what early years these attitudes go back. We refer to them as the 'Oedipus complex', because the legend of Oedipus realizes, with only a slight softening, the two extreme wishes that arise from the son's situation – to kill his father and take his mother to wife. I do not wish to assert that the Oedipus complex exhausts the relation of children to their parents: it can easily be far more complicated. The Oedipus complex can, moreover, be developed to a greater or lesser strength, it can even be reversed; but it is a regular and very important factor in a child's mental life, and there is more danger of our underestimating rather than overestimating its influence and that of the developments which proceed from it. Incidentally, children often react in their Oedipus attitude to a stimulus coming from their parents, who are frequently led in their preferences by difference of sex, so that the father will choose his daughter and the mother her son as a favourite, or, in case of a cooling off in the marriage, as a substitute for a love object that has lost its value.[1]

It cannot be said that the world has shown much gratitude to psychoanalytic research for its revelation of the Oedipus complex. On the contrary, the discovery has provoked the most violent opposition among adults; and those who had neglected to take part in the repudiation of this proscribed and tabooed emotional relationship made up for their fault later by depriving the complex of its value through twisted reinterpretations.[2] It is my unaltered conviction that there is nothing in this to [208] be disavowed or glossed over. We must reconcile ourselves to the fact which was recognized by the Greek legend itself as an inevitable fate. It is once again an interesting fact that the Oedipus complex, which has been rejected from real life, has been left to imaginative writing [*Dichtung*], has been placed freely, as it were, at its disposal. Otto Rank [1912*c*] has shown in a careful study how the Oedipus complex has provided

1 [Freud discusses the Oedipus complex at much greater length in Lecture XXI, Vol. 16, p. 290 ff. below.]

2 [This is of course an allusion to the secession of Adler and Jung. Cf. Vol. 16, footnote 2, p. 305 below.]

dramatic authors with a wealth of themes in endless modifications, softenings and disguises – in distortions, that is to say, of the kind which we are already familiar with as the work of a censorship. We may therefore also ascribe this Oedipus complex to dreamers who have been fortunate enough to escape conflicts with their parents in later life. And, intimately linked with it, we find what we call the 'castration complex',[1] the reaction to the threats against the child aimed at putting a stop to his early sexual activities and attributed to his father.

What we have already learnt from our study of the mental life of children will lead us to expect to find a similar explanation of the other group of forbidden dream wishes – the excessive sexual impulses. We are thus encouraged to make a study of the development of children's sexual life and from many sources we arrive at what follows.

First and foremost, it is an untenable error to deny that children have a sexual life and to suppose that sexuality only begins at puberty with the maturation of the genitals. On the contrary, from the very first children have a copious sexual life, which differs at many points from what is later regarded as normal. What in adult life is described as 'perverse' differs from the normal in these respects: first, by disregarding the barrier of species (the gulf between men and animals), secondly, by overstepping the barrier against disgust, thirdly that against incest (the prohibition against seeking sexual satisfaction from near blood relations), fourthly that against members of one's own sex, and fifthly the transferring [*Übertragung*] of the part played by the genitals to other organs and areas of the body. None of these barriers existed from the beginning; they were [209] only gradually erected in the course of development and education. Small children are free from them. They recognize no frightful gulf between human beings and animals; the arrogance with which men separate themselves from animals does not emerge until later.[2] To begin with, children exhibit no disgust at excreta but acquire this slowly under the pressure of education; they attach no special importance to the distinction between the sexes, but attribute the same conformation of the genitals to both; they direct their first sexual lusts [*Gelüste*] and their curiosity to those who are nearest and for other reasons dearest to them – parents, brothers and sisters, or nurses; and finally, they show (what later on breaks through once again at the climax of a love relation) that

1 [This is further explained in Lecture XX, Vol. 16, p. 279 f. below.]

2 [Freud enlarged on this in a contemporary paper, 'A Difficulty in the Path of Psychoanalysis' (1917*a*), *RSE*, **17**, 130.]

they expect to derive pleasure [*Lust*] not only from their sexual organs, but that many other parts of the body lay claim to the same sensitivity, afford them analogous feelings of pleasure and can accordingly play the part of genitals. Children may thus be described as 'polymorphously perverse', and if these impulses show only *traces* of activity, that is because on the one hand they are of less intensity compared with those in later life and on the other hand all a child's sexual manifestations are at once energetically suppressed by education. This suppression is, as it were, extended into theory; for adults endeavour to overlook one portion of the sexual manifestations of children and to disguise another portion by misinterpreting its sexual nature, so that they can then disavow the whole of them. It is often the very same people who in the nursery are furious with any sexual naughtinesses of children and afterwards at their writing tables defend the sexual purity of the same children. When children are left to themselves, or under the influence of seduction, they often bring about quite considerable achievements in the way of perverse sexual activity. Adults are of course right not to take this too seriously and to regard it as 'childishness', or 'playfulness', for children are not to be condemned as fully capable or fully responsible either before the judgement seat of morals or before the law; but nonetheless these things exist. They have their importance both as indications of a child's innate constitution and as causes and encouragements of later
[210] developments in him; they give us information on the sexual life of children and so on human sexual life in general. If, therefore, we once more find all these perverse wishful impulses behind our distorted dreams, that only means that in this field too dreams have taken a step backwards into the state of infancy.

Among these forbidden wishes special emphasis deserves to be further laid on the incestuous ones – that is, on those aiming at sexual intercourse with parents and brothers and sisters. You know what horror is felt, or at least professed, in human society at such intercourse, and what stress is laid on the prohibitions directed against it. Tremendous efforts have been made to explain this horror of incest. Some people have supposed that breeding considerations on the part of Nature have found psychical representation in this prohibition, since inbreeding would impair racial characters. Others have maintained that, as a result of living together from early childhood onwards, sexual desire has been diverted from the people in question. In both these cases, it may be remarked, an avoidance of incest would be secured automatically, and it would not be clear why such severe prohibitions were called for, which would point

rather to the presence of a strong desire for it. Psychoanalytic researches have shown unmistakably that the choice of an incestuous love object is, on the contrary, the first and invariable one, and that it is not until later that resistance to it sets in; it is no doubt impossible to trace back this resistance to *individual* psychology.[1]

Let us now bring together what our researches into child psychology have contributed to our understanding of dreams. We have not only found that the material of the forgotten experiences of childhood is accessible to dreams, but we have also seen that the mental life of children with all its characteristics, its egoism, its incestuous choice of love objects, and so on, still persists in dreams – that is, in the unconscious, and that dreams carry us back every night to this infantile level. The fact is thus confirmed that *what is unconscious in mental life is also what is infantile*. The strange impression of there being so much evil in people begins to diminish. This frightful evil is simply the initial, primitive, [211]
infantile part of mental life, which we can find in actual operation in children, but which, in part, we overlook in them on account of their small size, and which in part we do not take seriously since we do not expect any high ethical standard from children. Since dreams regress to this level, they give the appearance of having brought to light the evil in us. But this is a deceptive appearance, by which we have allowed ourselves to be scared. We are not so evil as we were inclined to suppose from the interpretation of dreams.

If these evil impulses in dreams are merely infantile phenomena, a return to the beginnings of our ethical development (since dreams simply make us into children once more in our thoughts and feelings), we need not, if we are reasonable, be ashamed of these evil dreams.[2] But what is reasonable is only a *part* of mental life, a number of other things take place in the mind which are not sensible; and so it happens that we *are* ashamed of these dreams in an unreasonable way. We subject them to the dream censorship, we are ashamed and angry if, as an exception, one of these wishes succeeds in making its way into consciousness in such an undistorted form that we are obliged to recognize it; indeed we are occasionally as ashamed of a *distorted* dream as if we understood it. Only think of the indignant judgement which the excellent elderly lady passed on her uninterpreted dream of the 'love services' [p. 120 above]. So the

1 [The whole subject of infantile sexuality is treated again at greater length in Lectures XX and XXI, Vol. 16.]

2 [The moral responsibility for the content of dreams was the subject of a special discussion by Freud (Section B of 1925*i*), *RSE*, **19**, 119 ff. Cf. also Vol. 16, p. 291 f. below.]

problem is not yet cleared up, and it is still possible that further consideration of the evil in dreams may lead us to form another judgement and arrive at another estimate of human nature. [Cf. Vol. 16, p. 298 below.]

As the outcome of our whole enquiry, let us grasp two discoveries, though they only signify the beginning of fresh enigmas and fresh doubts. First, the regression of the dream-work is not only a formal but also a material one. It not only translates our thoughts into a primitive form of expression; but it also revives the characteristics of our primitive mental life – the old dominance of the ego, the initial impulses of our sexual life, and even, indeed, our old intellectual endowment, if symbolic connections may be regarded as such. And secondly, all this, which is old and [212] infantile and was once dominant and alone dominant, must today be ascribed to the unconscious, our ideas of which are now becoming altered and extended. 'Unconscious' is no longer the name of what is latent at the moment; the unconscious is a particular realm of the mind with its own wishful impulses, its own mode of expression and its peculiar mental mechanisms which are not in force elsewhere. But the latent dream thoughts which we have discovered by interpreting dreams do not belong to this realm; they are on the contrary thoughts just as we might have thought them in waking life. Nevertheless, they are unconscious. How, then, is this contradiction to be solved? We begin to suspect that a distinction is to be drawn here. Something which is derived from our conscious life and shares its characteristics – we call it 'the day's residues' – combines with something else coming from the realm of the unconscious in order to construct a dream. The dream-work is accomplished between these two components. The influence exercised upon the day's residues by the addition of the unconscious is no doubt among the determinants of regression. This is the deepest insight that we can reach here into the essential nature of dreams – until we have investigated further regions of the mind. But the time will soon have come to provide another name for the unconscious character of the latent dream thoughts in order to distinguish it from the unconscious which comes from the realm of the infantile.[1]

We can, of course, raise another question besides: 'What is it that forces psychical activity during sleep to make this regression? Why does it not dispose of the mental stimuli that disturb sleep without doing this? And if, for the purposes of the dream censorship, it has to make use of disguise by means of the old and now unintelligible mode of expression, what is the point of reviving as well the old mental impulses, wishes and

1 [This question is taken up again at the end of Lecture XIV, p. 198 below.]

character traits, which are superseded today – of making use of material regression in addition to the formal kind?' The only answer that could satisfy us would be that in this way alone can a dream be constructed [*gebildet*], that it is not otherwise dynamically possible to get rid of the stimulus to the dream. But so far we have no right to give such an answer.

LECTURE XIV

WISH FULFILMENT

[213] Ladies and Gentlemen, shall I remind you once more of the ground we have covered so far? Of how, when we began applying our technique, we came up against the distortion in dreams, of how we thought we would begin by evading it and obtained our first decisive information on the essential nature of dreams from the dreams of children? Of how, after that, armed with what we had learnt from that enquiry, we made a direct assault on dream distortion and, as I hope, overcame it step by step? We are bound to admit, however, that the things we have discovered by the one path and by the other do not entirely correspond. It will be our task to piece the two sets of findings together and reconcile them with each other.

We found from both sources that the dream-work consists essentially in the transformation of thoughts into a hallucinatory experience. How this can happen is sufficiently mysterious; but it is a problem of general psychology with which we are not properly concerned here. We learnt from children's dreams that it is the intention of the dream-work to get rid of a mental stimulus, which is disturbing sleep, by means of the fulfilment of a wish. We were unable to say anything similar of distorted dreams till we found out how to interpret them. But it was from the first our expectation that we should be able to regard distorted dreams in the same light as those of children. The first confirmation of this expectation was brought to us by the discovery that in point of fact *all* dreams are children's dreams, that they work with the same infantile material, with the mental impulses and mechanisms of childhood. Now that we believe we have overcome dream distortion, we must go on to enquire whether the view of dreams as the fulfilment of wishes is also valid of distorted dreams.

A short time ago we submitted a series of dreams to interpretation, but we left wish fulfilment completely out of account. I feel sure that you must have repeatedly been driven to ask yourselves: 'But where is the
[214] wish fulfilment, which is supposed to be the aim of the dream-work?'

The question is an important one, for it has become the question raised by our lay critics. Human beings, as you know, have an instinctive [*instinktives*] tendency to fend off intellectual novelties. One of the ways in which this tendency is manifested is by immediately reducing the novelty to the smallest proportions, by compressing it if possible into a single catchword. 'Wish fulfilment' has become the catchword for the new theory of dreams. The layman asks: 'Where is the wish fulfilment?' And instantly, having heard that dreams are supposed to be wish fulfilments, and in the very act of asking the question, he answers it with a rejection. He immediately thinks of countless experiences of his own with dreams, in which the dream has been accompanied by feelings ranging from the unpleasurable to severe anxiety, so that the assertion made by the psychoanalytic theory of dreams seems to him most improbable. We have no difficulty in replying that in distorted dreams the wish fulfilment cannot be obvious but must be looked for, so that it cannot be pointed out until the dream has been interpreted. We know too that the wishes in these distorted dreams are forbidden ones – rejected by the censorship – whose existence was precisely the cause of the dream's distortion, the reason for the intervention of the dream censorship. But it is difficult to make the lay critic understand that before a dream has been interpreted one cannot enquire about the fulfilment of its wish. He will keep on forgetting this. His rejection of the theory of wish fulfilment is actually nothing other than a consequence of the dream censorship, a substitute for the rejection of the censored dream wishes and an effluence from it.

We too, of course, feel the need to explain to ourselves why there are so many dreams with a distressing content and, especially, why there are anxiety dreams. Here for the first time we come upon the problem of affects in dreams; it would deserve a monograph of its own, but unfortunately we cannot enter into it. If dreams are the fulfilment of wishes, distressing feelings should be impossible in them: the lay critics would appear to be right there. But three kinds of complications must be taken into account which they have not thought of.

[1] Firstly, it may be that the dream-work has not completely succeeded [215]
in creating a wish fulfilment; so that a portion of the distressing affect in the dream thoughts has been left over in the manifest dream. In that case analysis would have to show that these dream thoughts were far more distressing than the dream constructed out of them. That much can always be proved. If so, we must admit that the dream-work has not

achieved its aim any more than the dream of drinking, formed in response to the stimulus of thirst, succeeded in quenching the thirst [p. 117 above]. The dreamer remains thirsty and has to wake up in order to drink. Nevertheless it was a genuine dream, and had lost nothing of a dream's essential nature. We can only say: 'Ut desint vires, tamen est laudanda voluntas'.[1] The intention, at least, which can clearly be recognized, remains praiseworthy. Such instances of failure are no rare event. This is helped by the fact that it is so much harder for the dream-work to alter the sense of a dream's *affects* than of its *content*; affects are sometimes highly resistant. What then happens is that the dream-work transforms the distressing content of the dream thoughts into the fulfilment of a wish, while the distressing affect persists unaltered. In dreams of this kind the affect is quite inappropriate to the content, and our critics can say that dreams are so far from being wish fulfilments that even one with a harmless content can be felt as distressing. We can answer this foolish remark by pointing out that it is precisely in dreams like this that the wish-fulfilling purpose of the dream-work appears most clearly, because in isolation. The error arises because those who are unfamiliar with the neuroses picture the link between content and affect as too intimate and therefore cannot imagine the content being altered without a simultaneous alteration of the expression of affect attached to it.[2]

[2] A second factor, which is much more important and far-reaching, but which is equally overlooked by laymen, is the following. No doubt a
[216] wish fulfilment must bring pleasure; but the question then arises 'To whom?' To the person who has the wish, of course. But, as we know, a dreamer's relation to his wishes is a quite peculiar one. He repudiates them and censors them – he has no liking for them, in short. So that their fulfilment will give him no pleasure, but just the opposite; and experience shows that this opposite appears in the form of anxiety, a fact which has still to be explained. Thus a dreamer in his relation to his dream wishes can only be compared to an amalgamation of two separate people who are linked by some strong element in common. Instead of enlarging on this, I will remind you of a familiar fairy tale in which you will find the same situation repeated. A good fairy promised a poor married couple to grant them the fulfilment of their first three wishes. They were delighted, and made up their minds to choose their three wishes

1 ['Though the strength is lacking, the will deserves to be praised' (Ovid, *Ep. ex Pont.*, **3**, 4, 79).]

2 [The looseness of the connection between ideas and their accompanying affects had been insisted on by Freud from very early times. See, for instance, his first paper on 'The Neuropsychoses of Defence' (1894*a*), *RSE*, **3**, 48–9.]

carefully. But a smell of sausages being fried in the cottage next door tempted the woman to wish for a couple of them. They were there in a flash; and this was the first wish fulfilment. But the man was furious, and in his rage wished that the sausages were hanging on his wife's nose. This happened too; and the sausages were not to be dislodged from their new position. This was the second wish fulfilment; but the wish was the man's, and its fulfilment was most disagreeable for his wife. You know the rest of the story. Since after all they were in fact one – man and wife – the third wish was bound to be that the sausages should come away from the woman's nose. This fairy tale might be used in many other connections; but here it serves only to illustrate the possibility that if two people are not at one with each other the fulfilment of a wish of one of them may bring nothing but unpleasure to the other.[1]

It will not be difficult for us now to reach a still better understanding of anxiety dreams. We will bring up one more observation and then make up our minds to adopt a hypothesis in favour of which there is much to be said. The observation is that anxiety dreams often have a content entirely devoid of distortion, a content which has, so to speak, evaded the censorship. An anxiety dream is often the undisguised fulfilment of a wish – not, of course, of an acceptable wish, but of a repudiated [217]
one. The generation of anxiety has taken the place of the censorship. Whereas we can say of an infantile dream that it is the open fulfilment of a permitted wish, and of an ordinary distorted dream that it is the disguised fulfilment of a repressed wish, the only formula which fits an anxiety dream is that it is the open fulfilment of a repressed wish. The anxiety is a sign that the repressed wish has shown itself stronger than the censorship, that it has put through, or is on the point of putting through, its wish fulfilment in spite of the censorship. We perceive that what is for it a wish fulfilment can only be for us, who are on the side of the censorship, an occasion for distressing feelings and for fending off the wish. The anxiety that emerges in the dream is, if you like, anxiety at the strength of these wishes which are normally held down. Why this fending off [*Abwehr*] appears in the form of anxiety cannot be discovered from the study of dreams alone; anxiety must clearly be studied elsewhere.[2]

We may suppose that what is true of undistorted anxiety dreams applies also to those which are partly distorted as well as to other

1 [The whole of this paragraph was later included by Freud as a footnote in the 1919 edition of *I. of D.*, **5**, 519–20 *n.* The same fairy tale is also quoted, but in quite a different connection, in Freud's paper on 'The "Uncanny"' (1919*h*), *RSE*, **17**, 239.]

2 [It is the subject of Lecture XXV, Vol. 16, p. 346 ff. below.]

unpleasurable dreams, in which the distressing feelings probably correspond to an approach to anxiety. Anxiety dreams are as a rule also arousal dreams; we usually interrupt our sleep before the repressed wish in the dream has put its fulfilment through completely in spite of the censorship. In that case the function of the dream has failed, but its essential nature is not altered by this. We have compared dreams to the night-watchman or guardian of sleep, who tries to protect our sleep from disturbance [p. 112 f. above]. The night-watchman, too, may reach the point of waking the sleeper if he feels he is too weak alone to drive off the disturbance or the danger. Nevertheless we sometimes succeed in holding on to our sleep even when the dream begins to be precarious and to be turning into anxiety. We say to ourselves in our sleep 'after all it's only a dream', and sleep on.

When does it happen that a dream wish is in a position to overpower the censorship? The condition necessary for this may be fulfilled equally well by the dream wish or by the dream censorship. The wish may for an unknown reason be excessively strong on some occasion; but one gets an
[218] impression that it is more often the behaviour of the dream censorship that is responsible for this displacement of their relative strengths. We have already seen [p. 125 above] that the censorship acts with varying intensity in each particular case, that it treats each element of a dream with a different degree of severity. We can now add a further hypothesis to the effect that it is in general very variable and does not always employ equal severity to the same objectionable element. If things turn out so that on some occasion it feels itself powerless against a dream wish which threatens to take it by surprise, instead of distortion, it makes use of its last remaining expedient and abandons the state of sleep, at the same time generating anxiety.

In this connection it strikes us that we are still quite ignorant of why it is that these evil, repudiated wishes become active precisely at night and disturb us during our sleep. The answer is almost bound to lie in some hypothesis going back to the nature of the state of sleep. In daytime the heavy weight of censorship rests on them and as a rule makes it impossible for them to manifest themselves in any activity. At night this censorship, like all the other interests of mental life, is probably withdrawn, or at least greatly reduced, in favour of the single wish to sleep. It is this lowering of the censorship at night that the forbidden wishes have to thank for being able to become active once more. There are some neurotic patients who are unable to sleep and who admit to us that their insomnia was originally intentional. They did not dare to sleep because

they were afraid of their dreams – afraid, that is, of the results of the weakening of the censorship. You will easily see, however, that in spite of this the withdrawal of the censorship implies no gross carelessness. The state of sleep paralyses our powers of movement. If our evil intentions begin to stir, they can, after all, do nothing more than precisely cause a dream, which is harmless from the practical point of view. It is this soothing consideration that is the basis of the highly sensible remark made by the sleeper – made at night, it is true, but not forming part of dream life: 'After all it's only a dream. So let us leave it to take its course, and let us sleep on.'

[3] If, in the third place, you will recall our idea [*Auffassung*] that the dreamer fighting against his own wishes is to be compared with a summation of two separate, though in some way intimately connected, people, you will understand another possibility. For there is a possibility that the fulfilment of a wish may bring about something very far from pleasant – namely, a punishment. Here we can once more use the fairy tale of the three wishes as an illustration. The fried sausages on a plate were the direct fulfilment of the wish of the first person, the woman. The sausages on her nose were the fulfilment of the wish of the second person, the man, but were at the same time a punishment for the woman's foolish wish. (We shall discover in neuroses the motive for the third wish, the last remaining one in the fairy tale.)[1] There are many such punitive trends in the mental life of human beings; they are very powerful, and we may hold them responsible for some of the distressing dreams.[2] Perhaps you will now say that this leaves very little over of the famous wish fulfilment. But if you look more closely you will admit that you are wrong. Compared with the multiplicity (which I shall mention later) of the things that dreams might be and according to many authorities actually are, our solution – wish fulfilment, anxiety fulfilment, punishment fulfilment – is a very restricted one. We may add that the anxiety is the direct opposite of the wish, that opposites are especially close to one another in associations and that in the unconscious they coalesce [p. 155 ff. above]; and further, that the punishment is also the fulfilment of a wish – of the wish of the other, censoring person. [219]

On the whole, therefore, I have made no concession to your objection to the theory of wish fulfilment. It is our duty, however, to be able to indicate

1 [It is not clear what is intended here.]

2 [Punishment dreams are discussed in *I. of D.*, **5**, 423–6 and 498–9.]

the wish fulfilment in any distorted dream we may come across, and we shall certainly not evade the task. Let us go back to the dream we have already interpreted of the three bad theatre tickets for 1 florin 50 [pp. 107 and 122 above], from which we have already learnt so much. I hope you still recollect it. A lady, whose husband had told her during the day that her friend Elise, who was only three months her junior, had become engaged, dreamt that she was at the theatre with her husband. One side of the stalls was almost empty. Her husband said to her that Elise and her
[220] fiancé had wanted to go to the theatre too but had not been able to, since they had only got bad seats – three for 1 florin 50. She thought it would not really have done any harm if they had. We found that the dream thoughts related to her anger at having married so early and to her dissatisfaction with her husband. We may be curious to discover how these gloomy thoughts were transformed into the fulfilment of a wish and where any trace of it is to be found in the manifest content of the dream. We already know that the element 'too early, in a hurry' was eliminated from the dream by the censorship [p. 122 above]. The empty stalls were an allusion to it. The mysterious 'three for 1 florin 50' now becomes more intelligible to us with the help of the symbolism with which we have meanwhile become acquainted. The '3'[1] really means a man [or husband] and the manifest element is easy to translate: buying a husband with her dowry. ('I could have got one ten[2] times better with my dowry.') 'Marrying' is clearly replaced with 'going to the theatre'. 'Taking the theatre tickets too early' is, indeed, an immediate substitute for 'marrying too early'. This substitution is, however, the work of a wish fulfilment. Our dreamer was not always so dissatisfied with her early marriage as she was on the day when she received the news of her friend's engagement. She had been proud of it at one time and regarded herself as at an advantage over her friend. Simple-minded girls, after becoming engaged, are reputed often to express their joy that they will soon be able to go to the theatre, to all the plays which have hitherto been prohibited, and will be allowed to see everything. The pleasure in looking [*Schaulust*][T], or curiosity, which is revealed in this was no doubt originally a sexual desire to look [*sexuelle Schaulust*], directed towards sexual happenings and especially on to the girls' parents, and hence it became a powerful motive for urging them to an early marriage. In this way a visit to the theatre became an obvious substitute, by way of allusion, for being married. Thus the dreamer, in her present anger at her early marriage, harked back to the time at which early marriage was the fulfilment of a wish because it

1 I have not mentioned another plausible interpretation of this '3' in a childless woman, since this analysis brought up no material in support of it. [Cf. p. 143 above.]

2 [This is presumably a slip for 'a hundred'. Cf. p. 108 above.]

satisfied her scopophilia [*Schaulust*], and, under the lead of this old wishful impulse, she replaced marriage with going to the theatre. [221]

I cannot be accused of having specially chosen the most convenient example as evidence of a concealed wish fulfilment. The procedure would have had to be the same in the case of other distorted dreams. I cannot demonstrate this to you now, and I will only express my conviction that it could always be successfully accomplished. I will, however, dwell a little longer on this theoretical point. Experience has taught me that it is one of those most exposed to attack in the whole theory of dreams, and that many contradictions and misunderstandings arise from it. Apart from this, you may perhaps still be under the impression that I have already withdrawn part of my assertion in saying that a dream is a fulfilled wish or the opposite of one, or a realized anxiety or punishment; and you may think this is an opportunity of forcing further qualifications out of me. I have also been reproached for putting forward things that seem to me obvious in a manner that is too concise and consequently unconvincing.

When someone has accompanied us so far in the interpretation of dreams and has accepted everything that has been brought forward up to this point, it often happens that he comes to a halt at wish fulfilment and says: 'Granted that dreams always have a sense, and that that sense can be discovered by the technique of psychoanalysis, why must that sense, all evidence to the contrary, be invariably pushed into the formula of wish fulfilment? Why should not the sense of this nightly thinking be of as many kinds as that of daytime thinking? Why, that is, should not a dream correspond sometimes to a fulfilled wish, sometimes, as you yourself say, to the opposite of that or to a realized fear, but sometimes express an intention, a warning, a reflection with its "pros" and "cons", or a reproach, a scruple of conscience, an attempt at preparing for a coming task, and so on? Why must it always be only a wish, or at most its opposite?'

It might be thought that a difference of opinion on this point is unimportant, if one is agreed on the rest. It is enough, it might be said, that we have discovered the sense of dreams and the way of recognizing it; it is of less importance if we seem to have defined that sense too narrowly. But that is not so. A misunderstanding on this point affects the essence of our discoveries about dreams and endangers their value for the understanding of the neuroses. Moreover, a compromise of this sort – what is highly thought of in commercial life as being [222]

'accommodating' – is not in place, but detrimental rather, in scientific affairs.

My first answer to the question why dreams should not have a variety of meanings in the sense indicated is as usual in such cases: 'I don't know why they shouldn't. I should have no objection. As far as I'm concerned it could be so. There's only one detail in the way of this broader and more convenient view of dreams – that it isn't so in reality.' My second answer would be that the hypothesis that dreams correspond to a variety of forms of thinking and intellectual operations is not unfamiliar to me myself. I once reported a dream in one of my case histories which appeared on three nights in succession and then no more, and I explained this behaviour by the fact that the dream corresponded to an *intention*, and did not need to be repeated after the intention had been carried out.[1] Later on I published a dream which corresponded to an *admission*.[2] How, then, can I contradict myself and assert that dreams are never anything but a fulfilled wish?

I do it because I will not allow a foolish misunderstanding to pass which may rob us of the fruit of our efforts with dreams – a misunderstanding which confuses the dream with the latent dream thoughts, and asserts of the former something that applies solely to the latter. For it is quite correct to say that a dream can represent and be replaced by everything you have just enumerated – an intention, a warning, a reflection, a preparation, an attempt at solving a problem, and so on. But if you look properly, you will see that all this applies only to the latent dream thoughts, which have been transformed into the dream. You learn from interpretations of dreams that people's unconscious thinking is concerned with these intentions, preparations, reflections, and so on, out of which the dream-work then makes the dreams. If at the moment you are not interested in the dream-work, but are greatly interested in people's unconscious thought activity, you then eliminate the dream-work and say of the dream what is in practice quite correct – that it corresponds to a warning, an intention, and so on. What often happens in psychoanalytic activity is that our efforts are chiefly directed only to doing away with the dream form and inserting in the context instead of it the latent thoughts out of which the dream was made.

[223]

Thus, quite incidentally, we learn from our examination of the latent dream thoughts that all these highly complicated mental acts that we have named can take place unconsciously – a discovery as imposing as it is perplexing!

1 [This was the first dream in the analysis of 'Dora' (1905*e*), *RSE*, **7**, 57–60.]

2 [Cf. 'An Evidential Dream' (1913*a*), ibid., **12**, 267.]

But to go back, you are only correct so long as you are clearly aware that you have used an abbreviated form of expression and so long as you do not believe that the multiplicity you have been describing is to be related to the essential nature of dreams. When you speak of a 'dream', you must mean either the manifest dream – that is, the product of the dream-work – or, at most, the dream-work itself as well – that is, the psychical process which forms the manifest dream out of the latent dream thoughts. Any other use of the word is a confusion of ideas and can only lead to mischief.[1] If you are making statements about the latent thoughts behind the dream, do so directly and do not obscure the problem of dreams by the loose manner in which you speak. The latent dream thoughts are the material which the dream-work transforms into the manifest dream. Why should you want to confuse the material with the activity which forms it? If you do, what advantage have you over those who only knew the product of the activity and could not explain where it came from or how it was made?

The only essential thing about dreams is the dream-work that has influenced the thought material. We have no right to ignore it in our theory, even though we may disregard it in certain practical situations. Analytic observation shows further that the dream-work never restricts itself to translating these thoughts into the archaic or regressive mode of expression that is familiar to you. In addition, it regularly takes possession of something else, which is not part of the latent thoughts of the previous day, but which is the true motive force [*Motor*] for the construction of the dream. This indispensable addition is the equally unconscious wish for the fulfilment of which the content of the dream is given its new form. A dream may thus be any sort of thing insofar as you are only taking into account the thoughts it represents – a warning, an intention, a preparation, and so on; but it is always also the fulfilment of an unconscious wish and, if you are considering it as a product of the dream-work, it is only that. A dream is therefore never simply an intention, or a warning, but always an intention, etc., translated into the archaic mode of thought by the help of an unconscious wish and transformed to fulfil that wish.[2] The one characteristic, the wish fulfilment, is the invariable one; [224]

1 [Further discussions on the proper use of the term 'dream' can be found in two footnotes added in 1925 and 1914 respectively to *I. of D.*, **5**, 453 *n.* 2 and 518–19 *n.*, and also at the end of Section I of 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 198–9.]

2 [At the end of this sentence all the German editions have the plural, '*dieser Wünsche* (those wishes)', which would seem to obscure the meaning. An examination of the original manuscript (which is not very clear) appears to show that Freud in fact wrote, or intended to write, the singular, '*dieses Wunsches*'. A shorter, though essentially similar, account of the whole process is given in 'An Evidential Dream' (1913*a*), ibid., **12**, 270 ff.]

the other may vary. It may for its part once more be a wish, in which case the dream will, with the help of an unconscious wish, represent as fulfilled a latent wish of the previous day.

I can understand all this very clearly; but I cannot tell whether I have succeeded in making it intelligible to you as well. And I also have difficulty in proving it to you. That cannot be done without carefully analysing a great many dreams, and on the other hand this most critical and important point in our view of dreams cannot be convincingly represented without referring to what is coming later. It is impossible to suppose that, since everything is intimately interrelated, one can penetrate deeply into the nature of one thing without having concerned oneself with other things of a similar nature. Since we still know nothing of the dream's nearest relatives, neurotic symptoms, we must once more rest content at this point with what we have achieved. I will give you only one more illustrative example and lay before you one fresh consideration.

Let us once again take up the dream we have already so often returned to: the dream of the three theatre tickets for 1 florin 50. (I can assure you that I originally chose this example without any special purpose in view.) You know the latent dream thoughts: anger at having been in such a hurry to get married which arose when she heard the news that her friend had only just become engaged, putting a low value on her husband
[225] and the idea that she might have got a better one if only she had waited. We already know the wish which made a dream out of these thoughts: it was the desire to look, to be able to go to the theatre, most probably an offshoot of her old curiosity to discover at long last what really happens when one is married. This curiosity is, as we know, regularly directed by children towards their parents' sexual life; it is an infantile curiosity, and, so far as it still persists later, a drive impulse [*Triebregung*] with roots reaching back into infancy. But the news the dreamer had received during the day gave no occasion for awakening this desire to look [*Schaulust*], but only for awakening anger and regret. This wishful impulse [*Wunschregung*] was not in the first instance connected with the latent dream thoughts; and we were able to include the outcome of the dream interpretation in the analysis without taking any account of that impulse. But the anger in itself was not capable of creating a dream. A dream could not arise out of the thoughts that 'it was absurd to marry so early' until they had awakened the old wish to see at long last what happens in marriage. This wish then gave the dream content its form by

replacing marriage with going to the theatre, and the form was that of an earlier wish fulfilment: 'There! now I may go to the theatre and look at everything that's forbidden, and you mayn't! I'm married and you must wait!' In this way the dreamer's present situation was transformed into its opposite, an old triumph was put in the place of her recent defeat. And, incidentally, a satisfaction of her scopophilia [*Schaulust*] was mixed with a satisfaction of her egoistic competitive sense. This satisfaction then determined the manifest content of the dream, in which the position actually was that she was sitting in the theatre while her friend could not gain admission to it. The portions of the content of the dream behind which the latent dream thoughts still lay concealed were superimposed on this situation of satisfaction as a misplaced and unintelligible modification of it. The dream's interpretation had to disregard everything that served to represent the wish fulfilment and to re-establish the distressing latent dream thoughts from these obscure remaining hints.

The fresh consideration I wish to bring before you is to draw your attention to the latent dream thoughts which have now been put in the [226]
foreground. I beg you not to forget that in the first place they are unconscious[1] to the dreamer, and secondly that they are completely rational and coherent so that they can be understood as natural reactions to the precipitating cause of the dream, and thirdly that they can be the equivalent of any mental impulse or intellectual operation. I shall now describe these thoughts more strictly than before as the 'day's residues', whether or not the dreamer confesses to them. I shall now distinguish between the day's residues and the latent dream thoughts, and, in conformity with our earlier usage, I shall designate as latent dream thoughts everything we learn in interpreting the dream, whereas the day's residues are only a portion of the latent dream thoughts. Our view is then that something is added to the day's residues, something that was also part of the unconscious, a powerful but repressed wishful impulse; and it is this alone that makes the construction of the dream possible. The influence of this wishful impulse on the day's residues creates the further portion of the latent dream thoughts – that which need no longer appear rational and intelligible as being derived from waking life.

I have made use of an analogy for the relation of the day's residues to the unconscious wish, and I can only repeat it here. In every undertaking there must be a capitalist who covers the required outlay and an entrepreneur who has the idea and knows how to carry it out. In the

1 [See footnote, p. 20 above.]

construction of dreams, the part of the capitalist is always played by the unconscious wish alone; it provides the psychical energy for the construction of the dream. The entrepreneur is the day's residues, which decide how this outlay is to be employed. It is possible, of course, for the capitalist himself to have the idea and the expert knowledge or for the entrepreneur himself to possess capital. This simplifies the practical situation but makes its theoretical understanding more difficult. In economics the same person is constantly divided into his two aspects of capitalist and entrepreneur and this restores the fundamental situation on which our analogy was based. In dream construction the same variations occur and I will leave them for you to follow.[1]

[227] We cannot advance any further here, for you have probably long been disturbed by a doubt which deserves to be given a hearing. 'Are the day's residues', you will ask, 'really unconscious in the same sense as the unconscious wish which must be added to them in order to make them capable of producing a dream?' Your suspicion is correct. This is the salient point of the whole business. They are *not* unconscious in the same sense. The dream wish belongs to a different unconscious – to the one which we have already recognized as being of infantile origin and equipped with peculiar mechanisms [p. 183 above]. It would be highly opportune to distinguish these two kinds of unconscious by different names. But we would prefer to wait till we have become familiar with the field of phenomena of the neuroses. People consider a single unconscious as something fantastic. What will they say when we confess that we cannot make shift without two of them?[2]

Let us break off here. Once again you have only heard something incomplete. But is it not hopeful to reflect that this knowledge has a continuation, which either we ourselves or other people will bring to light? And have not we ourselves learnt enough that is new and surprising?

1 [This analogy appeared originally in Section C of Chapter VII of *I. of D.*, **5**, 501–3, where it is illustrated at greater length.]

2 [The question of the uses of the term 'unconscious' was a crucial one for Freud's theories. He touched on it at several points in the course of these lectures (particularly on pp. 99, 164 f. and 184 above, and Vol. 16, p. 260 ff. and – a last brief mention – on p. 386 below). But he was evidently already feeling uncomfortable about it and in fact revised his views on the whole subject some years later in *The Ego and the Id* (1923*b*). A full account of the problem and its history can be found in the Editors' Introduction to that work, *RSE*, **19**, 4 ff. The new solution is also explained in Lecture XXXI of the *New Introductory Lectures* (1933*a*), ibid., **22**, 51 ff.]

LECTURE XV

UNCERTAINTIES AND CRITICISMS

Ladies and Gentlemen, we will nevertheless not leave the field of dreams [228]
without dealing with the commonest doubts and uncertainties which our novelties and our theories have given rise to so far. Attentive listeners among you will themselves have collected some of the relevant material.

(1) You may have formed an impression that, even though the technique is correctly carried out, the findings of our interpretative work on dreams admit of so many uncertainties as to defeat any secure translation of the manifest dream into the latent dream thoughts. You will argue in support of this that in the first place one never knows whether a particular element of the dream is to be understood in its actual sense or as a symbol, since the things employed as symbols do not cease on that account to be themselves. If, however, one has no objective clue for deciding this, the interpretation must at that point be left to the arbitrary choice of the interpreter. Furthermore, as a result of the fact that in the dream-work contraries coalesce, it is always left undetermined whether a particular element is to be understood in a positive or negative sense – as itself or as its contrary [p. 155 above]. Here is a fresh opportunity for the interpreter to exercise an arbitrary choice. Thirdly, in consequence of the reversals of every kind of which dreams are so fond [p. 156 f.], it is open to the interpreter to carry out a reversal like this in connection with any passage in the dream he chooses. And lastly, you will mention having heard that one is never certain whether the interpretation one has found for a dream is the only possible one. We run the risk of overlooking a perfectly admissible 'overinterpretation' of the same dream [p. 150 f.]. In these circumstances, you will conclude, so much room is left to the interpreter's arbitrary decision as to be incompatible with objective certainty in the findings. Or alternatively you may suppose that the fault does not lie with dreams but that the inadequacies of our dream interpretation are to be attributed to errors [229]
in our views and premises.

All your material is unimpeachable, but it does not, I think, justify your conclusions, and in two respects: namely that the interpretation of dreams is, as you insist, at the mercy of arbitrary choice and that the lack of results throws doubts on the correctness of our procedure. If instead of the interpreter's arbitrary choice you would speak of his skill, his experience and his understanding, I should agree with you. We cannot, of course, do without a personal factor of that kind, especially in the more difficult problems of dream interpretation. But the position is no different in other scientific occupations. There is no means of preventing one person from handling a particular technique worse than another, or one person from making better use of it than another. What in other ways gives an impression of arbitrariness – in, for instance, the interpretation of symbols – is done away with by the fact that as a rule the interconnection between the dream thoughts, or the connection between the dream and the dreamer's life, or the whole psychical situation in which the dream occurs, selects a single one from among the possible determinations presented and dismisses the rest as unserviceable. The conclusion that because of the imperfections of dream interpretation our hypotheses are incorrect is invalidated by pointing out that on the contrary ambiguity or indefiniteness is a characteristic of dreams which was necessarily to be anticipated.

Let us recall that we have said that the dream-work makes a translation of the dream thoughts into a primitive mode of expression similar to picture-writing [p. 152 ff. above]. All such primitive systems of expression, however, are characterized by indefiniteness and ambiguity of this sort, without justifying us in casting doubts on their serviceability. The coalescence of contraries in the dream-work is, as you know, analogous to the so-called 'antithetical meaning of primal words' in the most ancient languages. Indeed, Abel (1884), the philologist to whom we owe this line of thought, implores us not to suppose that communications made by one person to another with the help of such ambivalent words were on that account ambiguous. On the contrary, intonation and gesture must have made it quite certain in the context of the speech which
[230] of the two contraries the speaker intended to convey. In writing, where gesture is absent, its place was taken by an additional pictograph which was not intended to be spoken – for instance by a picture of a little man, limply squatting or stiffly erect, according to whether the ambiguous hieroglyph '*ken*' was to mean 'weak' or 'strong'. In this way, in spite of the ambiguity of the sounds and signs, misunderstanding was avoided. [Cf. above, p. 156.]

The old systems of expression – for instance, the scripts of the most ancient languages – betray vagueness in a variety of ways which we would not tolerate in our writing today. Thus in some Semitic scripts only the consonants in the words are indicated. The reader has to insert the omitted vowels according to his knowledge and the context. The hieroglyphic script behaves very similarly, though not precisely in the same way; and for that reason the pronunciation of ancient Egyptian remains unknown to us. The sacred script of the Egyptians is indefinite in yet other ways. For instance, it is left to the arbitrary decision of the scribe whether he arranges the pictures from right to left or from left to right. In order to be able to read it one must obey the rule of reading towards the faces of the figures, birds, and so on. But the scribe might also arrange the pictographs in *vertical* columns, and in making inscriptions on comparatively small objects he allowed considerations of decorativeness and space to influence him in altering the sequence of the signs in yet other ways. The most disturbing thing about the hieroglyphic script is, no doubt, that it makes no separation between words. The pictures are placed across the page at equal distances apart; and in general it is impossible to tell whether a sign is still part of the preceding word or forms the beginning of a new word. In Persian cuneiform script, on the other hand, an oblique wedge serves to separate words.

An extremely ancient language and script, which however is still used by four hundred million people, is the Chinese. You must not suppose that I at all understand it; I only obtained some information about it because I hoped to find analogies in it to the indefiniteness of dreams. Nor has my expectation been disappointed. The Chinese language is full of instances of indefiniteness which might fill us with alarm. As is well known, it consists of a number of syllabic sounds, which are spoken either singly or combined into pairs. One of the principal dialects has some four hundred such sounds. Since, however, the vocabulary of this [231] dialect is reckoned at about four thousand words, it follows that each sound has on an average ten different meanings – some fewer but some correspondingly more. There are quite a number of methods of avoiding ambiguity, since one cannot infer from the context alone which of the ten meanings of the syllabic sound the speaker intends to evoke in the hearer. Among these methods are those of combining two sounds into a compound word and of using four different 'tones' in the pronunciation of the syllables. It is even more interesting from the point of view of our comparison to learn that this language has practically no grammar. It is impossible to tell of any of the monosyllabic words whether it is a noun

or a verb or an adjective; and there are no verbal inflections by which one could recognize gender, number, termination, tense or mood. Thus the language consists, one might say, solely of the raw material, just as our thought language is resolved by the dream-work into its raw material, and any expression of relations is omitted. In Chinese the decision in all cases of indefiniteness is left to the hearer's understanding and this is guided by the context. I have made a note of an example of a Chinese proverb which, literally translated, runs:

'Little what see much what wonderful.'

This is not hard to understand. It may mean: 'The less someone has seen, the more he finds to wonder at'; or: 'There is much to wonder at for him who has seen little.' There is, of course, no question of distinguishing between these two translations, which differ only grammatically. In spite of this indefiniteness, we have been assured that the Chinese language is a quite excellent vehicle for the expression of thought. So indefiniteness need not necessarily lead to ambiguity.

It must, of course, be admitted that the system of expression by dreams occupies a far more unfavourable position than any of these ancient languages and scripts. For after all they are fundamentally intended for communication: that is to say, they are always, by whatever method and with whatever assistance, meant to be understood. But precisely this characteristic is absent in dreams. A dream does not want to say anything to anyone. It is not a vehicle for communication; on the contrary, it is
[232] meant to remain ununderstood. For that reason we must not be surprised or at a loss if it turns out that a number of ambiguities and obscurities in dreams remain undecided. The one certain gain we have derived from our comparison is the discovery that these points of uncertainty which people have tried to use as objections to the soundness of our dream interpretations are on the contrary regular characteristics of all primitive systems of expression.

The question of how far the intelligibility of dreams in fact extends can only be answered by practice and experience.[1] Very far, I believe; and my view is confirmed if we compare the results produced by correctly trained analysts. The lay public, including the scientific lay public, are well known to enjoy making a parade of scepticism when faced with the difficulties and uncertainties of a scientific achievement. I think they are wrong in this. You are perhaps not all aware that a similar situation arose

1 [Cf. a later paper on 'The Limits to the Possibility of Interpretation', Section A of 'Some Additional Notes on Dream Interpretation as a Whole' (1925*i*), *RSE*, **19**, 115 ff.]

in the history of the deciphering of the Babylonian–Assyrian inscriptions. There was a time when public opinion was very much inclined to regard the decipherers of cuneiform as visionaries and the whole of their researches as a 'swindle'. But in 1857 the Royal Asiatic Society made a decisive experiment. It requested four of the most highly respected experts in cuneiform, Rawlinson, Hincks, Fox Talbot and Oppert, to send it, in sealed envelopes, independent translations of a newly discovered inscription; and, after a comparison between the four productions, it was able to announce that the agreement between these experts went far enough to justify a belief in what had so far been achieved and confidence in further advances. The derision on the part of the learned lay world gradually diminished after this, and since then certainty in reading cuneiform documents has increased enormously.

(2) A second group of doubts is closely connected with the impression, which no doubt you yourselves have not escaped, that a number of the solutions to which we find ourselves driven in interpreting dreams seem to be forced, artificial, dragged in by the hair of their head – arbitrary, that is, or even comic and facetious. Remarks to this effect are so frequent that I will choose at random the last that has been reported to me. [233]
So listen to this. In free Switzerland the head of a training college was recently removed from his post on account of his interest in psychoanalysis. He entered a protest, and a Bern newspaper published the report of the school authorities on his appeal. I will select a few sentences dealing with psychoanalysis from this document: 'Moreover, we are surprised at the far-fetched and artificial character of many of the examples, which are also to be found in the volume by Dr Pfister of Zürich which is quoted. . . . It is really surprising, therefore, that the head of a training college should accept all these assertions and pretended proofs without criticism.' These sentences are represented as a decision reached by someone 'making a calm judgement'. It is rather this calmness, I think, which is 'artificial'. Let us examine these remarks more closely, in the expectation that a little reflection and a little expert knowledge can be of no disadvantage even to a calm judgement.

It is truly refreshing to see how swiftly and unerringly a person can arrive at a judgement on some delicate problem of depth psychology after his first impression of it. The interpretations seem to him far-fetched and forced and he does not like them; so they are false and all this business of interpretation is worthless. Not even a fleeting thought is given to the other possibility – that there are good reasons why these

interpretations are bound to have this appearance; after which the further question would follow of what these good reasons are.

The matter under consideration relates in essence to the results of displacement, which you have become acquainted with as the most powerful instrument of the dream censorship. With the help of displacement the dream censorship creates substitutive structures which we have described as allusions. But they are allusions which are not easily recognizable as such, from which the path back to the genuine thing is not easily traced, and which are connected with the genuine thing by the strangest, most unusual, external associations.[1] In all these cases it is a question, however, of things which are *meant* to be hidden, which are condemned to concealment, for that is what the dream censorship is
[234] aiming at. But we must not expect that a thing which has been hidden will be found in its own place, in its proper position. The frontier-control commissions which are operating today are more cunning in this respect than the Swiss school authorities. In their search for documents and plans they are not content with examining briefcases and portfolios, but they consider the possibility that spies and smugglers may have these forbidden things in the most secret portions of their clothing where they decidedly do not belong – for instance, between the double soles of their boots. If the hidden things are there, it will certainly be possible to call them 'far-fetched', but it is also true that a great deal will have been found.[2]

If we recognize that the links between a latent dream element and its manifest substitute can be of the most out-of-the-way and peculiar nature, sometimes appearing comic and sometimes resembling a joke, we are basing ourselves on copious experience of examples which, as a rule, we have not solved ourselves. It is often impossible to give such interpretations on our own account: no sensible person could guess at the connection. The dreamer gives us the translation either all at once by a direct association – *he* is able to, since it was he who produced the substitute – or else he brings up so much material that the solution no longer calls for any particular acumen, but presents itself, so to speak, as a matter of course. If the dreamer fails to assist in one or other of these two ways, the manifest element in question will for ever remain unintelligible to us. I will, if I may, give you an example which occurred to me recently. One of my women patients lost her father in the course of the treatment. Since then she has taken every opportunity of bringing

1 [See footnote 3, p. 151 above.]

2 [There is some untranslatable punning here in the original.]

him to life in her dreams. In one of these her father appeared (in a particular connection of no further relevance) and said: '*It's a quarter-past eleven, it's half-past eleven, it's a quarter to twelve*.' By way of interpretation of this oddity all that occurred to her was that her father liked his grown-up children to appear punctually at the family meals. No doubt this was connected with the dream element, but it threw no light on its origin. There was a suspicion, based on the immediate situation in the treatment, that a carefully suppressed critical revolt against her beloved and honoured father played some part in the dream. In the further course of her associations, apparently remote from the dream, she told how the [235]
day before there had been a lot of talk about psychology in her presence, and a relative of hers had remarked: 'The *Urmensch* [primal man] survives in all of us.' This seemed to provide us with the explanation. It had given her an excellent opportunity of bringing her dead father to life once again. She made him in the dream into an '*Uhrmensch*' ['clock man'] by making him announce the quarter-hours at midday.

You will not be able to escape the resemblance of this example to a joke; and it has in fact often happened that a joke of the dreamer's has been regarded as a joke of the interpreter's. There are other instances in which it has been far from easy to decide whether what we are dealing with is a joke or a dream. But you will recall that the same doubt arose in the case of some parapraxes – slips of the tongue [p. 39 above]. A man reported as a dream of his that his uncle had given him a kiss while they were sitting in his *auto*(mobile).[1] He himself very quickly added the interpretation: it meant '*auto-erotism*' (a term from the theory of the libido, indicating satisfaction obtained without any outside object). Had the man set out, then, to have some fun with us and was he passing off a joke that had occurred to him as a dream? I think not; I believe he really dreamt it. But what is the origin of this puzzling similarity? This question once led me temporarily aside from my path by compelling me to make jokes themselves the subject of a detailed investigation.[2] It was there shown how jokes originate: a preconscious[3] train of thought is abandoned for a moment to be worked over in the unconscious, and from this it emerges as a joke. Under the influence of the unconscious it is subjected to the effects of the mechanisms that hold sway

1 [This dream is reported in *I. of D.*, **5**, 365.]

2 [*Jokes and their Relation to the Unconscious* (1905*c*). Freud relates in *I. of D.*, **4**, 265 *n.*, how he was led into writing that work by a critic (Wilhelm Fliess) who complained that the dreams he reported were too full of jokes. See also a passage on this point in the book on *Jokes* itself (*RSE*, **8**, 150).]

3 [This term is explained in Lecture XIX, Vol. 16, p. 261 below.]

there – condensation and displacement – the same processes that we have found concerned in the dream-work; and it is to this common feature that is to be ascribed the similarity, when it occurs, between jokes
[236] and dreams. But the unintended 'dream joke' brings none of the yield of pleasure of a true joke. You can learn why if you go more deeply into the study of jokes. A 'dream joke' strikes us as a bad joke; it does not make us laugh, it leaves us cold.[1]

In this, however, we are treading in the footsteps of the dream interpretation of antiquity, which, along with much that is unserviceable, has left us some good examples of dream interpretation, which we ourselves could not better. I will repeat to you a dream which was of historic importance and which is reported of Alexander the Great, with slight variations, by Plutarch and Artemidorus of Daldis [cf. p. 75 above]. When the king was laying siege to the obstinately defended city of Tyre (322 B.C.), he once dreamt that he saw a dancing satyr. Aristander, the dream interpreter, who was present with the army, interpreted the dream by dividing the word '*Satyros*' into *σὰ Τύρος* [sa Turos] (thine is Tyre), and therefore promised that he would triumph over the city. Alexander was led by this interpretation to continue the siege and eventually captured Tyre. The interpretation, which has a sufficiently artificial appearance, was undoubtedly the right one.[2]

(3) I can well imagine that you will be especially impressed when you hear that objections to our view of dreams have even been made by people who have themselves, as psychoanalysts, been engaged for a considerable time in interpreting dreams. It would have been too much to expect that such an abundant encouragement to fresh errors as this theory offers should have been neglected; and so, as a result of conceptual confusions and unjustified generalizations, assertions have been made which are not far behind the medical view of dreams in their incorrectness. You know one of them already. It tells us that dreams are concerned with attempts at adaptation to present conditions and with attempts at solving future problems – that they have a 'prospective purpose' (Maeder [1912]). We have already shown [p. 194 above] that this assertion is based on a confusion between the dream and the latent dream thoughts and is therefore
[237] based on disregarding the dream-work. As a characterization of the unconscious intellectual activity of which the latent dream thoughts

1 [See Chapter VI of the book on *Jokes*, and in particular *RSE*, **8**, 150 and 155–6. The point has already been mentioned above on p. 152.]

2 [This is also reported in *I. of D.*, **4**, 88–9 *n.* 2.]

form part, it is on the one hand no novelty and on the other not exhaustive, since unconscious intellectual activity is occupied with many other things besides preparing for the future.[1] A far worse confusion seems to underlie the assurance that the idea of death will be found behind every dream [Stekel, 1911*a*, 34]. I am not clear exactly what is meant by this formula. But I suspect that it conceals a confusion between the dream and the dreamer's whole personality. [Cf. *I. of D.*, **5**, 355.]

An unjustifiable generalization, based on a few good examples, is involved in the statement that every dream allows of two interpretations – one which agrees with our account, a 'psychoanalytic' one, and another, an 'anagogic' one, which disregards the drive impulses and aims at representing the higher functions of the mind (Silberer [1914]).[2] There are dreams of this kind, but you will try in vain to extend this view even to a majority of dreams. Again, after all that I have said to you, you will find quite incomprehensible an assertion that all dreams are to be interpreted bisexually, as a confluence of two currents described as a masculine and a feminine one (Adler [1908]). [Cf. *I. of D.*, **5**, 355.] There are, of course, a few dreams of this kind too; and you may learn later that they are constructed like certain hysterical symptoms. The reason why I have mentioned all these discoveries of fresh universal characteristics of dreams is in order to warn you against them or at least to leave you in no doubt as to what I think of them.

(4) One day the objective value of research into dreams seemed to be put in question by an observation that patients under analytic treatment arrange the content of their dreams in accordance with the favourite theories of their physicians – some dreaming predominantly of sexual drive impulses, others of the struggle for power and yet others even of rebirth (Stekel). The weight of this observation was, however, diminished by the reflection that human beings had dreams before there was any psychoanalytic treatment which could give those dreams a direction, and that people who are now under treatment used also to dream during the period before the treatment started. What was true about this novelty could soon be seen to be self-evident and of no relevance to the theory of dreams. The day's residues which instigate dreams are left over from powerful interests in waking life. When the remarks made by the [238]

1 [This theory of Maeder's was dealt with at length by Freud in two footnotes to *I. of D.*, **5**, 453 *n.* 2 and 518–19 *n.*]

2 [This was fully discussed in *I. of D.*, **5**, 468–9, as well as in 'Dreams and Telepathy' (1922*a*), *RSE*, **18**, 206 f., and in a footnote to 'A Metapsychological Supplement to the Theory of Dreams' (1916–17*f* [1915]), ibid., **14**, 203 *n.* 1.]

physician and the hints he gives become of significance to the patient, they enter the circle of the day's residues and can provide psychical stimuli for the construction of dreams like any other emotionally coloured interests of the previous day which have not been dealt with, and they then operate like somatic stimuli which impinge on the sleeper during his sleep. The trains of thought set going by the physician can, like these other instigators of dreams, appear in the manifest content of a dream or be discovered in its latent content. Indeed, we know that a dream can be experimentally produced, or, to put it more correctly, a part of the dream material can be introduced into the dream. In producing these effects on his patients, an analyst is thus playing a part no different from an experimenter who, like Mourly Vold, gives particular postures to the limbs of the subjects of his experiments. [Cf. p. 76 above.]

It is often possible to influence dreamers as to what they shall dream *about*, but never as to *what* they shall dream. The mechanism of the dream-work and the unconscious dream wish are exempt from any outside influence. In considering dreams with a somatic stimulus, we have already found [p. 84 f. above] that the characteristic nature and independence of dream life are shown in the reaction with which dreams respond to the somatic or mental stimuli that are brought to bear. The thesis which we have been discussing, and which seeks to throw doubt on the objectivity of research into dreams, is thus once again based on a confusion – this time between the dream and the dream material.[1]

[239] This then, ladies and gentlemen, is what I wanted to tell you about the problems of dreams. As you will guess, there is much that I have had to pass over, and you will have been aware that on almost every point what I have said has necessarily been incomplete. That, however, is due to the connection between the phenomena of dreaming and those of the neuroses. We have studied dreams as an introduction to the theory of the neuroses, and this was certainly a more correct procedure than if we had done the opposite. But just as dreams prepare the way to an understanding of the neuroses, so, on the other hand, a true appreciation of dreams can only be achieved after a knowledge of neurotic phenomena.[2]

I cannot tell what you will think of it, but I must assure you that I do not regret having claimed so much of your interest and of the time available to us for the problems of dreams. There is nothing else from which one can so quickly arrive at a conviction of the correctness of the theses

1 [For a further discussion of this, see Section VII of 'Remarks on the Theory and Practice of Dream Interpretation' (1923*c*), *RSE*, **19**, 103 ff.]

2 [There is a reference back to dreams near the end of the last lecture of the present series, Vol. 16, p. 403 below.]

by which psychoanalysis stands or falls. Exacting work over many months and even years is called for to show that the symptoms of a case of neurotic illness have a sense, serve a purpose and arise out of the patient's experiences in life. On the other hand, only a few hours' effort may be enough to prove that the same thing is true of a dream which is, to start with, confused to the point of being unintelligible, and thus to confirm all the premises of psychoanalysis – the unconscious nature of mental processes, the peculiar mechanisms which they obey and the drive forces which are expressed in them. And when we bear in mind the sweeping analogy between the structure [*Aufbau*] of dreams and that of neurotic symptoms and at the same time consider the rapidity of the transformation which makes a dreamer into a waking and reasonable man, we arrive at a certainty that neuroses too are based only on an alteration in the play of forces between the powers of mental life.[1]

1 [Freud dealt with the subject of dreams again in the first of his *New Introductory Lectures* (1933*a*), Lecture XXIX; *RSE*, **22**, 7.]

Freud with sons Ernst and Martin, 1916

It is easy to forget that the *Introductory Lectures* were delivered during a World War. In a letter to Max Eitingon dated August 26, 1916, Freud wrote: 'I am glad to tell you that we had both our sons at once on leave with us in Salzburg, both in good health. Now they are off again, one north, the other south, and we haven't had any news from them yet.'

GENERAL THEORY OF THE NEUROSES
(1917 [1916–17])

LECTURE XVI

PSYCHOANALYSIS AND PSYCHIATRY

Ladies and Gentlemen, I am delighted to see you again, at the beginning [243]
of a new academic year, for a resumption of our discussions. Last year I spoke to you of the way in which psychoanalysis deals with parapraxes and dreams. This year I should like to introduce you to an understanding of the phenomena of neurosis, which, as you will soon learn, have a great deal in common with both of the others. But I must warn you in advance that I shall not be able to offer you the same position in relation to me this year as I did last year. At that time I set great store on never taking a step without remaining in agreement with your judgement; I discussed a great deal with you and gave way to your objections – in fact I recognized you and your 'common sense' as a deciding factor. But this is no longer possible and for a simple reason. Parapraxes and dreams were not unfamiliar to you as phenomena; we might say that you had as much experience or could easily obtain as much experience of them as I had. The region of the phenomena of neurosis is, however, strange to you; insofar as you are not doctors yourselves, you have no other access to them than through what I have to tell you; and of what help is the best judgement if it is not accompanied by familiarity with the material that is to be judged?

But you must not take this warning of mine to mean that I propose to give you dogmatic lectures and to insist on your unqualified belief. Such a misunderstanding would do me a grave injustice. I do not wish to arouse conviction; I wish to stimulate thought and to upset prejudices. If as a result of lack of knowledge of the material you are not in a position to form a judgement, you should neither believe nor reject. You should listen and allow what I tell you to work on you. It is not so easy to arrive at convictions, or, if they are reached easily, they soon turn out to be worthless and incapable of resistance. The only person who has a right to a conviction is someone who, like me, has worked for many years at the same material and who, in doing so, has himself had the same new [244]
and surprising experiences. What is the good, then, in the sphere of the

intellect, of these sudden convictions, these lightning-like conversions, these instantaneous rejections? Is it not clear that the '*coup de foudre*', love at first sight, is derived from quite another sphere, from that of the emotions? We do not even require of our *patients* that they should bring a conviction of the truth of psychoanalysis into the treatment or be adherents of it. Such an attitude often raises our suspicions. The attitude that we find the most desirable in them is a benevolent scepticism. So you too should endeavour to allow the psychoanalytic view to grow up quietly in you alongside of the popular or psychiatric one, till opportunities arise for the two to influence each other, to compete with each other and to unite in leading to a conclusion.

On the other hand, you should not for a moment suppose that what I put before you as the psychoanalytic view [*Auffassung*] is a speculative system. It is on the contrary empirical – either a direct expression of observations or the outcome of a process of working them over. Whether this working over has been carried out in an adequate and justifiable manner will appear in the course of the further advance of the science, and indeed I may assert without boasting, after a lapse of nearly twenty-five years, and having reached a fairly advanced age,[1] that these observations are the result of particularly hard, concentrated and deep-going work. I have often had an impression that our opponents were unwilling to take any account of this origin of our theses, as though they thought what was in question were merely subjectively determined notions to which someone else might oppose others of his own choice. This behaviour of our opponents is not entirely intelligible to me. It may perhaps be due to the fact that, as a doctor, one usually makes so little contact with neurotic patients and pays so little attention to what they say that one cannot imagine the possibility that anything valuable could be derived from their communications – the possibility, that is, of carrying out any thorough observations upon them. I take this opportunity of assuring you that in the course of these lectures I shall indulge in very little controversy, especially with individuals. I have never
[245] been able to convince myself of the truth of the maxim that strife is the father of all things. I believe it is derived from the Greek sophists and is at fault, like them, through overvaluing dialectics. It seems to me, on the contrary, that what is known as scientific controversy is on the whole quite unproductive, apart from the fact that it is almost always conducted on highly personal lines. Up to a few years ago I was able to boast that I had only once engaged in a regular scientific dispute – with one single

1 [Freud was about sixty at this time.]

worker (Löwenfeld of Munich).[1] It ended in our becoming friends and we have remained so to this day. But I did not repeat the experiment for a long time, as I did not feel sure that the outcome would be the same.[2]

Now you will no doubt conclude that a rejection such as this of all written discussion shows a high degree of inaccessibility to objections, of obstinacy, or, to use the polite colloquial scientific term, of pigheadedness [*Verranntheit*]. I should like to say in reply that when once, after such hard work, one has arrived at a conviction, one has at the same time acquired a certain right to retain that conviction with some tenacity. I may also urge that in the course of my work I have modified my views on a few important points, changed them and replaced them with fresh ones – and in each case, of course, I have made this publicly known. And the outcome of this frankness? Some people have taken no notice whatever of my self-corrections and continue to this day to criticize me for hypotheses which have long ceased to have the same meaning for me. Others reproach me precisely for these changes and regard me as untrustworthy on their account. Of course! a person who has occasionally changed his opinions is deserving of no belief at all, since he has made it all too likely that his latest assertions may also be mistaken; but a person who has unflinchingly maintained what he once asserted, or who cannot be quickly enough persuaded to give it up, must naturally be pigheaded or stubborn! What can one do, in the face of these contradictory objections by the critics, but [246]
remain as one is and behave in accordance with one's own judgement? I am resolved to do that, and I shall not be deterred from modifying or withdrawing any of my theories, as my advancing experience may require. In regard to *fundamental* discoveries I have hitherto found nothing to alter, and I hope this will remain true in the future.[3]

1 [This was on the subject of Freud's early theories on anxiety. His second paper on the question (1895*f*) was entirely concerned with Löwenfeld's criticisms. Löwenfeld himself, though never an adherent of Freud's views, ultimately became much more favourable to them. Cf. the Editors' Note to that paper, *RSE*, **3**, 107.]

2 [There is an allusion in this to Freud's much more recent controversies with Adler and Jung, especially in his 'History of the Psychoanalytic Movement' (1914*d*), ibid., **14**, 44 ff. and 51 ff.]

3 [Perhaps the chief change in Freud's views up to the time of this lecture had been his abandonment of the purely traumatic causation of the neuroses and his insistence instead on the importance of the innate drive forces and on the great part played by phantasies. On this see his paper on the part played by sexuality in the neuroses (1906*a*), ibid., **7**, 283–8. Later on there were, of course, to be further important changes in his views – for instance on the nature of anxiety (cf. *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 139 ff.) and on the sexual development of women (cf. the Editors' Note to 'Some Psychical Consequences of the Anatomical Distinction between the Sexes' (1925*j*), ibid., **19**, 245 ff.). But what lay ahead above all were a revision of the theory of the drives in *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 7 ff., and a new structural picture of the mind in *The Ego and the Id* (1923*b*), ibid., **19**, 11 ff. All these changes were to be discussed fifteen years later in the *New Introductory Lectures* (1933*a*), ibid., **22**, 5 ff.]

I am to put before you, then, the psychoanalytic view of the phenomena of neurosis. In doing so, the best plan would seem to be to make a start in connection with the phenomena we have already dealt with, for the sake both of analogy and contrast; and I will begin with a symptomatic action [Vol. 15, p. 54 above] which I have seen many people perform during my consulting hours. We analysts cannot do much for the people who come to us in our consulting room to lay before us in a quarter of an hour the miseries of a long lifetime. Our deeper knowledge makes it difficult for us to give the kind of opinion another doctor would – 'There's nothing wrong with you' – with the added advice: 'You should arrange for a mild hydropathic treatment.' One of my colleagues who was asked what he did with his consultation patients shrugged his shoulders and replied: 'I fine them so-and-so many Kronen for a frivolous waste of time.' So you will not be surprised to hear that even in the case of busy psychoanalysts their consulting hours are not apt to be very lively. I have had the ordinary door between my waiting room and my consulting and
[247] treatment room doubled and given a baize lining. There can be no doubt about the purpose of this arrangement. Now it constantly happens that a person whom I have brought in from the waiting room omits to shut the door behind him and almost always he leaves *both* doors open. As soon as I notice this I insist in a rather unfriendly tone on his or her going back and making good the omission – even if the person concerned is a well-dressed gentleman or a fashionable lady. This makes an impression of uncalled-for pedantry. Occasionally, too, I have put myself in a foolish position by making this request when it has turned out to be a person who cannot touch a door handle himself and is glad if someone with him spares him the necessity. But in the majority of cases I have been right; for anyone who behaves like this and leaves the door open between a doctor's waiting room and consulting room is ill-mannered and deserves an unfriendly reception. But do not take sides over this till you have heard the sequel. For this carelessness on the part of the patient occurs only when he has been alone in the waiting room and has therefore left an empty room behind him; it never happens if other people, strangers to him, have been waiting with him. In this latter case he knows quite well that it is in his interest not to be overheard while he is talking to the doctor, and he never fails to shut both the doors carefully.

Thus the patient's omission is neither accidentally nor senselessly determined; and indeed it is not unimportant, for, as we shall see, it throws light on the newcomer's attitude to the doctor. The patient is one of the great multitude who have a craving for mundane authority, who

wish to be dazzled and intimidated. He may have enquired on the telephone as to the hour at which he could most easily get an appointment; he had formed a picture of a crowd of people seeking help, like the crowd outside one of Julius Meinl's branches.[1] He now comes into an empty, and moreover extremely modestly furnished, waiting room, and is shocked. He has to make the doctor pay for the superfluous respect which he had intended to offer him: so – he omits to shut the door between the waiting room and the consulting room. What he means to say to the doctor by his conduct is: 'Ah, so there's no-one here and no-one's likely to come while I'm here.' He would behave equally [248]
impolitely and disrespectfully during the consultation if his arrogance were not given a sharp reprimand at the very beginning.

The analysis of this small symptomatic action tells you nothing you did not know before: the thesis that it was not a matter of chance but had a motive, a sense and an intention, that it had a place in an assignable mental context and that it provided information, by a small indication, of a more important mental process. But, more than anything else, it tells you that the process thus indicated was unknown to the consciousness of the person who carried out the action, since none of the patients who left the two doors open would have been able to admit that by this omission he wanted to give evidence of his contempt. Some of them would probably have been aware of a sense of disappointment when they entered the empty waiting room; but the connection between this impression and the symptomatic action which followed certainly remained unknown to their consciousness.

Beside this small analysis of a symptomatic action we will now place an observation on a patient. I choose this one because it is fresh in my memory, but also because it can be reported comparatively briefly. A certain amount of detail is indispensable in any such account.

A young officer, home on short leave, asked me to undertake the treatment of his mother-in-law, who, though in the happiest circumstances, was embittering her own life and the lives of her relatives through an absurd idea. In this way I made the acquaintance of a well-preserved lady of fifty-three, friendly and simple in her nature, who told me the following story without any reluctance. She lived in the country, most happily married, with her husband, who was at the head of a large factory. She could not give enough praise to her husband's affectionate solicitude. It had been a love match thirty years ago, and since then there

1 [The wartime queue outside one of the popular Austrian grocery chain-stores.]

had never been any trouble, discord or cause for jealousy. Her two children were happily married; her husband (and their father), out of a sense of duty, was not yet willing to retire. A year before, she had received an anonymous letter accusing her excellent husband of a love affair with a young girl; and the incredible – and to herself
[249] unintelligible – result was that she immediately believed it, and since then her happiness had been destroyed. The course of events, in greater detail, was something like this. She had a housemaid with whom she used, perhaps too often, to have intimate talks. This girl pursued another one with a positively malicious hostility because she had done so much better for herself in life, though she was of no higher origin. Instead of going into service, this other girl had managed to get a commercial training, had entered the factory and, as a result of shortage of personnel, owing to members of the staff being called up for military service, she was promoted to a good position. She now lived in the factory itself, had social relations with all the gentlemen and was actually addressed as 'Fräulein'. The girl who had made less of a success in life was of course ready to repeat all kinds of bad things of her former schoolmate. One day our lady had a conversation with the housemaid about a gentleman who had been staying with them, who was well known not to be living with his wife but to be having an affair with another woman. She did not know how it happened, but she suddenly said: 'The most dreadful thing that could happen to me would be if I were to learn that my dear husband was having an affair too.' The next day she received an anonymous letter by post which, as though by magic, gave her this very information, written in a disguised hand. She decided, probably rightly, that the letter was the work of the malicious housemaid, since it specified as her husband's mistress the girl whom the servant pursued with her hatred. But although she at once saw through the intrigue and had seen enough instances where she lived of how little credence such cowardly denunciations deserved, what happened was that the letter instantly prostrated her. She became terribly excited, sent for her husband at once and reproached him violently. Her husband laughed the accusation off and did the best possible thing. He brought in the family doctor (who was also the factory doctor) who made efforts to soothe the unfortunate lady. The further conduct of both of them was also entirely sensible. The housemaid was dismissed, but the alleged rival was not. Since then the patient had repeatedly been pacified to the point of no longer believing the content of the anonymous letter, but never thoroughly and never for long. It was enough for her to hear the young

lady's name mentioned or to meet her in the street and a fresh attack of distrust, pain and reproaches would burst out in her. [250]

This, then, is the case history of this excellent woman. Not much psychiatric experience was needed to understand that, in contrast to other neurotics, she was giving too mild an account of her case – that she was, as we say, dissimulating – and that she had never really got over her belief in the accusation contained in the anonymous letter.

What attitude, then, will a psychiatrist adopt in a case of illness like this? We know already how he would behave to the symptomatic action of the patient who fails to shut the consulting-room door. He pronounces it to be a chance event of no psychological interest with which he has no further concern. But this procedure cannot be carried over to the illness of the jealous woman. The symptomatic action seems to be a matter of indifference; but the symptom forces itself on our attention as a matter of importance. It is accompanied by intense subjective suffering and, as an objective fact, it threatens the communal life of a family; it is thus an undeniable subject of psychiatric interest. The psychiatrist will start by endeavouring to characterize the symptom by some essential feature. The idea with which the woman torments herself cannot in itself be called absurd; it does, indeed, happen that elderly married men have love affairs with young girls. But there is something else about it which *is* absurd and hard to understand. The patient had no other reason at all for believing that her affectionate and loyal husband belonged to this otherwise not so rare class of husbands except what was asserted in the anonymous letter. She knew that this document had no evidential value and she was able to give a satisfying explanation of its origin. She ought therefore to have been able to tell herself that she had no ground whatever for her jealousy, and she did tell herself so. But in spite of this she suffered as much as if she regarded this jealousy as completely justified. Ideas of this kind, which are inaccessible to logical arguments based on reality, are by general agreement described as *delusions*. The good lady, then, was suffering from *delusions of jealousy*. This is no doubt the essential feature of this case of illness.

After this first point has been established our psychiatric interest will become even livelier. If a delusion is not to be got rid of by a reference to reality, no doubt it did not originate from reality either. Where else did it originate? There are delusions of the most varied content: why in our case is the content of the delusion jealousy in particular? In what kind of people do delusions, and especially delusions of jealousy, come about? We should like to hear what the psychiatrist has to say about this; but at [251]

this point he leaves us in the lurch. He enters into only a single one of our enquiries. He will investigate the woman's family history and will *perhaps* give us this reply: 'Delusions come about in people in whose families similar and other psychical disorders have repeatedly occurred.' In other words, if this woman developed a delusion she was predisposed to it by hereditary transmission [*Übertragung*]. No doubt that is something; but is it all we want to know? Was this the only thing that contributed to the causation of the illness? Must we be content to suppose that it is a matter of indifference or caprice or is inexplicable whether a delusion of jealousy arises rather than any other sort? And ought we to understand the assertion of the predominance of the hereditary influence in a negative sense as well – that no matter what experiences this woman's mind encountered she was destined some time or other to produce a delusion? You will want to know why it is that scientific psychiatry will give us no further information. But my reply to you is: 'he is a rogue who gives more than he has.' The psychiatrist knows no way of throwing more light on a case like this one. He must content himself with a diagnosis and a prognosis – uncertain in spite of a wealth of experience – of its future course.

But can psychoanalysis do more here? Yes, it actually can. I hope to be able to show you that, even in a case so hard to access as this, it can discover something which makes a first understanding possible. And to begin with I would draw your attention to the inconspicuous detail that the patient herself positively provoked the anonymous letter, which now gave support to her delusion, by informing the scheming housemaid on the previous day that it would cause her the greatest unhappiness if her husband had a love affair with a young girl. In this way she first put the notion of sending the anonymous letter into the housemaid's head. Thus the delusion acquires a certain independence of the letter; it had been present already in the patient as a fear – or was
[252] it as a wish? Let us now add to this the small further indications yielded by only two analytic sessions. The patient, indeed, behaved in a very uncooperative way when, after telling me her story, she was asked for her further thoughts, ideas [*Einfälle*] and memories. She said that nothing occurred to her, that she had told me everything already, and after two sessions the experiment with me had in fact to be broken off because she announced that she already felt well and that she was sure the pathological idea would not come back. She only said this, of course, from resistance and from dread of the continuation of the analysis. Nevertheless, during these two sessions she let fall a few remarks which

allowed of, and indeed necessitated, a particular interpretation; and this interpretation threw a clear light on the genesis of her delusion of jealousy. She herself was intensely in love with a young man, with the same son-in-law who had persuaded her to come to me as a patient. She herself knew nothing, or perhaps only a very little, of this love; in the family relationship that existed between them it was easy for this passionate liking to disguise itself as innocent affection. After all our experiences elsewhere, it is not hard for us to feel our way into [*einzufühlen*][T] the mental life of this upright wife and worthy mother, of *Einfühlung* the age of fifty-three. Being in love like this, a monstrous and impossible thing, could not become conscious; but it remained in existence and, even though it was unconscious, it exercised a severe pressure. Something had to become of it, some relief had to be looked for; and the easiest mitigation was offered, no doubt, by the mechanism of displacement which plays a part so regularly in the generating of delusional jealousy. If not only were she, the old woman, in love with a young man, but if also her old husband were having a love affair with a young girl, then her conscience would be relieved of the weight of her unfaithfulness. The phantasy of her husband's unfaithfulness thus acted as a cooling compress on her burning wound. Her own love had not become conscious to her, but its mirror reflection, which brought her such an advantage, now became conscious as an obsession [*zwangsartig*] and delusion. No arguments against it could, of course, have any effect, for they were directed only against the mirror image and not against the original which gave the other its strength and which lay hidden, inviolable, in the unconscious.

Let us now bring together what this effort at a psychoanalysis, short [253] and impeded as it was, has brought to light for an understanding of this case – assuming, of course, that our enquiries were correctly carried out, which I cannot here submit to your judgement. Firstly, the delusion has ceased to be absurd or unintelligible; it had a sense, it had good motives and it fitted into the context of an emotional experience of the patient's. Secondly, the delusion was necessary, as a reaction to an unconscious mental process which we have inferred from other indications, and it was precisely to this connection that it owed its delusional character and its resistance to every logical and realistic attack. It itself was something desired, a kind of consolation. Thirdly, the fact that the delusion turned out to be precisely a jealous one and not one of another kind was unambiguously determined by the experience that lay behind the illness.[1] You

1 [This sentence occurs in a less clear form in some of the earlier German editions.]

recall of course that, the day before, she had told the scheming maid that the most dreadful thing that could happen to her would be her husband's unfaithfulness. Nor will you have overlooked the two important analogies between this case and the symptomatic action which we analysed – the explanation of its sense or intention and its relation to something unconscious that was involved in the situation.

Naturally this does not answer all the questions that we might ask in connection with this case. On the contrary, the case bristles with further problems – some that have in general not yet become soluble and others which could not be solved owing to the particular circumstances being unfavourable. For instance, why did this lady who was happily married fall in love with her son-in-law? and why did the relief, which might have been possible in other ways, take the form of this mirror image, this projection of her state on to her husband? You must not think it is otiose or frivolous to raise such questions. We already have some material at our disposal which might possibly serve to answer them. The lady was at a critical age, at which sexual needs in women suffer a sudden and undesired increase; that alone might account for the event. Or it may further have been that her excellent and faithful husband had for some years no longer enjoyed the sexual capacity which the well-preserved
[254] woman required for her satisfaction. Experience has shown us that it is precisely men in this position, whose faithfulness can consequently be taken for granted, who are distinguished by treating their wives with unusual tenderness, and by showing particular forbearance for their nervous troubles. Or, again, it may not be without significance that the object of this pathogenic love was precisely the young husband of one of her daughters. A powerful erotic tie with a daughter, which goes back in the last resort to the mother's sexual constitution, often finds a way of persisting in a transformation of this sort. In this connection I may perhaps remind you that the relation between mother-in-law and son-in-law has been regarded from the earliest times of the human race as a particularly awkward one and that among primitive people it has given rise to very powerful taboo regulations and 'avoidances'.[1] The relation is frequently excessive by civilized standards both in a positive and negative direction. Which of these three factors became operative in our case, or whether two of them or perhaps all three came together, I cannot, it is true, tell you; but that is only because I was not permitted to continue the analysis of the case for more than two sessions.

1 See my *Totem and Taboo* (1912–13*a*) [Essay I, *RSE*, **13**, 20 ff.].

I notice now, gentlemen, that I have been talking to you about a number of things which you are not yet prepared to understand. I did so in order to carry out the comparison between psychiatry and psychoanalysis. But there is one thing that I can ask you now. Have you observed any sign of a contradiction between them? Psychiatry does not employ the technical methods of psychoanalysis; it omits to make any inferences from the *content* of the delusion, and, in pointing to heredity, it gives us a very general and remote aetiology instead of indicating first the more special and proximate causes. But is there a contradiction, an opposition in this? Is it not rather a case of one supplementing the other? Does the hereditary factor contradict the importance of experience? Do not the two things rather combine in the most effective manner? You will grant that there is nothing in the nature of psychiatric work which could be opposed to psychoanalytic research. What is opposed to psychoanalysis is not psychiatry but psychiatrists. Psychoanalysis is related to psychiatry [255] approximately as histology is to anatomy: the one studies the external forms of the organs, the other studies their construction out of tissues and cells. It is not easy to imagine a contradiction between these two species of study, of which one is a continuation of the other. Today, as you know, anatomy is regarded by us as the foundation of scientific medicine. But there was a time when it was as much forbidden to dissect the human cadaver in order to discover the internal structure of the body as it now seems to be to practise psychoanalysis in order to learn about the internal mechanism of the mind. It is to be expected that in the not too distant future it will be realized that a scientifically based psychiatry is not possible without a sound knowledge of the deeper-lying unconscious processes in mental life.

Perhaps, however, the much-abused psychoanalysis has friends among you who will be pleased if it can be justified from another direction – from the therapeutic side. As you know, our psychiatric therapy is not hitherto able to influence delusions. Is it possible, perhaps, that psychoanalysis can do so, thanks to its insight into the mechanism of these symptoms? No, gentlemen, it cannot. It is as powerless (for the time being at least) against these ailments as any other form of therapy. *We* can understand, indeed, what has happened in the patient, but we have no means of making the patient himself understand it. You have heard how I was unable to pursue the analysis of this delusion beyond a first beginning. Will you be inclined to maintain on that account that an analysis of such cases is to be rejected because it is fruitless? I think not. We have a right, or rather a duty, to carry on our research without consideration

of any immediate beneficial effect. In the end – we cannot tell where or when – every little fragment of knowledge will be transformed into power [*Können*], and into therapeutic power as well. Even if psychoanalysis showed itself as unsuccessful in every other form of nervous and psychical disease as it does in delusions, it would still remain completely justified as an irreplaceable instrument of scientific research. It is true that in that case we should not be in a position to practise it. The human material on which we seek to learn, which lives, has its own will and needs its motives for cooperating in our work, would hold back from us.
[256] Let me therefore end my remarks today by informing you that there are extensive groups of nervous disorders in which the transformation of our better understanding into therapeutic power has actually taken place, and that in these illnesses, which are difficult to access by other means, we achieve, under favourable conditions, successes which are second to no others in the field of internal medicine.[1]

1 [Psychoanalysis as a method of psychotherapy is the subject of the last lecture of the series (XXVIII), p. 396 ff. below.]

LECTURE XVII

THE SENSE OF SYMPTOMS

Ladies and Gentlemen, in the last lecture I explained to you that clinical [257]
psychiatry takes little notice of the outward form or content of individual symptoms, but that psychoanalysis takes matters up at precisely that point and has established in the first place the fact that symptoms have a sense and are related to the patient's experiences. The sense of neurotic symptoms was first discovered by Josef Breuer from his study and successful cure (between 1880 and 1882) of a case of hysteria which has since become famous. It is true that Pierre Janet brought forward the same evidence independently; indeed, the French worker can claim priority of publication, for it was only a decade later (in 1893 and 1895), while he was collaborating with me, that Breuer published his observation. In any case it may seem a matter of some indifference who made the discovery, for, as you know, every discovery is made more than once and none is made all at once. And, apart from this, success does not always go along with merit: America is not named after Columbus. The great psychiatrist Leuret[1] gave it as his opinion, before Breuer and Janet, that even the delusional ideas of the insane would certainly be found to have a sense if only we understood how to translate them. I must admit that for a long time I was prepared to give Janet very great credit for throwing light on neurotic symptoms, because he regarded them as expressions of *idées inconscientes* which dominated the patients.[2] But since then he has expressed himself with exaggerated reserve, as if he wanted to admit that the unconscious had been nothing more to him than a form of words, a makeshift, *une façon de parler* – that he had meant nothing real by it.[3] Since then I have ceased to understand Janet's writings; but I think he has unnecessarily forfeited much credit.

Thus neurotic symptoms have a sense, like parapraxes and dreams, [258]
and, like them, have a connection with the life of those who produce

1 [François Leuret (1797–1851). (Leuret, 1834, 131.)]

2 [See, for example, Janet, 1888.]

3 [For the gist of this see Janet, 1913, 39.]

them. I should now like to make this important discovery plainer to you by a few examples. I can indeed only assert, I cannot prove, that it is always and in every instance so. Anyone who looks for experiences himself will find convincing evidence. But for certain reasons I shall choose these examples from cases not of hysteria but of another, highly remarkable neurosis which is fundamentally very much akin to it and about which I have a few introductory remarks to make.

This neurosis, known as 'obsessional neurosis' [*Zwangsneurose*], is not so popular as the universally familiar hysteria. It is not, if I may express myself thus, so obtrusively noisy, it behaves more like a private affair of the patient's, it dispenses almost entirely with somatic phenomena, and creates all its symptoms in the mental sphere. Obsessional neurosis and hysteria are the forms of neurotic illness upon the study of which psychoanalysis was first built, and in the treatment of which, too, our therapy celebrates its triumphs. But obsessional neurosis, in which the puzzling leap from the mental to the physical plays no part, has actually, through the efforts of psychoanalysis, become more perspicuous and familiar to us than hysteria, and we have learnt that it displays certain extreme characteristics of the nature of neurosis far more glaringly.

Obsessional neurosis is shown in the patient's being occupied with thoughts in which he is in fact not interested, in his being aware of impulses [*Impulse*] in himself which appear very strange to him and in his being led to actions the performance of which give him no enjoyment, but which it is quite impossible for him to omit. The thoughts (obsessions [*Zwangsvorstellungen*]) may be senseless in themselves, or merely a matter of indifference to the subject; often they are completely silly, and invariably they are the starting point of a strenuous mental activity, which exhausts the patient and to which he only surrenders himself most unwillingly. He is obliged against his will to brood and speculate as though it were a question of his most important vital problems. The impulsions which the patient is aware of in himself may also make a childish and senseless impression; but as a rule they have a content of the most frightful kind, tempting him, for instance, to commit
[259] serious crimes, so that he not merely disavows them as alien to himself, but flies from them in horror and protects himself from carrying them out by prohibitions, renunciations and restrictions upon his freedom. At the same time, these impulses never – literally never – force their way through to performance; the outcome lies always in victory for the flight and the precautions. What the patient actually carries out – his so-called

obsessional actions [*Zwangshandlungen*] – are very harmless and certainly trivial things, for the most part repetitions or ceremonial elaborations of the activities of ordinary life. But these necessary activities (such as going to bed, washing, dressing or going for a walk) become extremely tedious and almost insoluble tasks. In different forms and cases of obsessional neurosis the pathological ideas, impulsions and actions are not combined in equal proportions; it is the rule, rather, that one or other of these factors dominates the picture and gives its name to the illness, but the common element in all these forms is sufficiently unmistakable.

Certainly this is a crazy illness. The most extravagant psychiatric imagination would not, I think, have succeeded in constructing anything like it; and if one did not see it before one every day one would never bring oneself to believe in it. Do not suppose, however, that you will help the patient in the least by calling on him to take a new line, to cease to occupy himself with such foolish thoughts and to do something sensible instead of his childish pranks. He would like to do so himself, for he is completely clear in his head, shares your opinion of his obsessional symptoms and even puts it forward to you spontaneously. Only he cannot help himself. What is carried into action in an obsessional neurosis is sustained by an energy to which we probably know nothing comparable in normal mental life. There is only one thing he can do: he can make displacements, and exchanges, he can replace one foolish idea with another somewhat milder, he can proceed from one precaution or prohibition to another, instead of one ceremonial he can perform another. He can displace the obsession [*Zwang*] but not remove it. The ability to displace any symptom into something far removed from its original conformation is a main characteristic of his illness. Moreover, it is a striking fact that in his condition the contradictions (polarities) with which mental life is interlaced [cf. p. 266 below] emerge especially sharply differentiated. Alongside of obsessions with a positive and negative content, *doubt* makes itself felt in the intellectual field and little by little [260]
it begins to gnaw even at what is usually most certain. The whole position ends up in an ever-increasing degree of indecision, loss of energy and restriction of freedom. At the same time, the obsessional neurotic starts off with a very energetic disposition, he is often extraordinarily self-willed and as a rule he has intellectual gifts above the average. He has usually reached a satisfactorily high level of ethical development; he exhibits over-conscientiousness, and is more than ordinarily correct in his behaviour. You can imagine that no small amount of work is needed

before one can make one's way any distance into this contradictory hotch-potch of character traits and symptoms. And to begin with we aim at nothing whatever else than understanding a few of the symptoms and being able to interpret them.

Perhaps you would like to know in advance, having in mind our earlier talks, what attitude contemporary psychiatry adopts towards the problems of obsessional neurosis. But it is a meagre chapter. Psychiatry gives names to the different obsessions but says nothing further about them. On the other hand, it insists that those who suffer from these symptoms are 'degenerates'. This gives small satisfaction; in fact it is a judgement of value – a condemnation instead of an explanation. We are supposed to think that every possible sort of eccentricity may arise in degenerates. Well, it is true that we must regard those who develop such symptoms as somewhat different in their nature from other people. But we may ask: are they more 'degenerate' than other neurotics – than hysterical patients, for instance, or those who fall ill of psychoses? Once again, the characterization is evidently too general. Indeed, we may doubt whether there is any justification for it at all, when we learn that such symptoms occur too in distinguished people of particularly high capacities, capacities important for the world at large. It is true that, thanks to their own discretion and to the untruthfulness of their biographers, we learn little that is intimate about the great men who are our models; but it may nevertheless happen that one of them, like Émile Zola, may be a fanatic for the truth, and we then learn from him of the many strange obsessional habits to which he was a lifelong victim.[1]

[261] Psychiatry has found a way out by speaking of '*dégénérés supérieurs*'. Very nice. But we have found from psychoanalysis that it is possible to get permanently rid of these strange obsessional symptoms, just as of other complaints and just as in people who are not degenerate. I myself have succeeded repeatedly in this.[2]

I shall give you only two examples of the analysis of an obsessional symptom: one an old observation which I cannot find a better one to replace, and another recently met with. I limit myself to this small number, because it is impossible in such reports to avoid being very diffuse and entering into every detail.

1 E. Toulouse, *Émile Zola: enquête médico-psychologique*, Paris, 1896.

2 [Freud probably discussed obsessional neurosis more often than any other disorder – from the beginning of his career almost to the end of it. A list of some of the more important references can be found in an Appendix to his 'Notes upon a Case of Obsessional Neurosis' (1909*d*), *RSE*, **10**, 241.]

A lady, nearly thirty years of age, who suffered from the most severe obsessional manifestations and whom I might perhaps have helped if a malicious chance had not brought my work to nothing – I may be able to tell you more about this later on – performed (among others) the following remarkable obsessional action many times a day. She ran from her room into another neighbouring one, took up a particular position there beside a table that stood in the middle, rang the bell for her housemaid, sent her on some indifferent errand or let her go without one, and then ran back into her own room. This was certainly not a very distressing symptom, but was nevertheless calculated to excite curiosity. The explanation was reached in the most unequivocal and unobjectionable manner, free from any possible contribution on the doctor's part. I cannot see how I could possibly have formed any suspicion of the sense of this obsessional action or could have offered any suggestion on how it was to be interpreted. Whenever I asked the patient 'Why do you do that? What sense has it?' she answered: 'I don't know.' But one day, after I had succeeded in defeating a major, fundamental doubt of hers, she suddenly knew the answer and told me what it was that was connected with the obsessional action. More than ten years before, she had married a man very much older than herself, and on the wedding night he was impotent. Many times during the night he had come running from his room into [262] hers to try once more, but every time without success. Next morning he had said angrily: 'I should feel ashamed in front of the housemaid when she makes the bed,' took up a bottle of red ink that happened to be in the room and poured its contents over the sheet, but not on the exact place where a stain would have been appropriate. I could not understand at first what this recollection had to do with the obsessional action in question; the only resemblance I could find was in the repeated running from one room into the other, and perhaps also in the entrance of the housemaid. My patient then led me up to the table in the second room and showed me a big stain on the tablecloth. She further explained that she took up her position in relation to the table in such a way that the maid who had been sent for could not fail to see the stain. There could no longer be any doubt of the intimate connection between the scene on her wedding night and her present obsessional action, though all kinds of other things remained to be learnt.

It was clear, in the first place, that the patient was identifying herself with her husband; she was playing his part by imitating his running from one room into the other. Further, to carry on the analogy, we must agree that the bed and the sheet were replaced by the table and the

tablecloth. This might seem arbitrary, but surely we have not studied dream symbolism to no purpose. In dreams too we often find a table which has to be interpreted as a bed. Table and bed[1] together stand for marriage, so that the one can easily take the place of the other.

It already seems proved that the obsessional action had a sense; it appears to have been a representation, a repetition, of the significant scene. But we are not obliged to come to a halt here. If we examine the relation between the two more closely, we shall probably obtain information about something that goes further – about the intention of the obsessional action. Its kernel was obviously the summoning of the housemaid, before whose eyes the patient displayed the stain, in contrast to her husband's remark that he would feel ashamed in front of the maid. Thus he, whose part she was playing, did not feel ashamed in front of the
[263] maid; accordingly the stain was in the right place. We see, therefore, that she was not simply repeating the scene, she was continuing and at the same time correcting it; she was putting it right. But by this she was also correcting the other thing, which had been so distressing that night and had made the expedient with the red ink necessary – his impotence. So the obsessional action was saying: 'No, it's not true. He had no need to feel ashamed in front of the housemaid; he was not impotent.' It represented this wish, in the manner of a dream, as fulfilled in a present-day action; it served the purpose of making her husband superior to his past mishap.

Everything I could tell you about this woman fits in with this. Or, more correctly speaking, everything else we know about her points the way to this interpretation of what was in itself an unintelligible obsessional action. The woman had been living apart from her husband for years and was struggling with an intention to obtain a legal divorce. But there was no question of her being free of him; she was forced to remain faithful to him; she withdrew from the world so as not to be tempted; she exculpated and magnified his nature in her imagination. Indeed, the deepest secret of her illness was that by means of it she protected her husband from malicious gossip, justified her separation from him and enabled him to lead a comfortable separate life. Thus the analysis of a harmless obsessional action led directly to the inmost core of an illness, but at the same time betrayed to us no small part of the secret of obsessional neurosis in general. I am glad to let you dwell a little on this example because it combines conditions which we could not fairly

1 [The English phrase is 'bed and board', which is itself a translation of a law-Latin term for marriage.]

expect to find in every case. Here the interpretation of the symptom was discovered by the patient herself at a single blow, without any prompting or intervention on the analyst's part; and it resulted from a connection with an event which did not (as is usually the case) belong to a forgotten period of childhood, but which had happened in the patient's adult life and had remained undimmed in her memory. All the objections which criticism is normally in the habit of raising against our interpretation of symptoms fall to the ground in this particular case. We cannot hope always to have such good luck.[1]

And one thing more. Were you not struck by the way in which this [264]
unobtrusive obsessional action has led us into the intimacies of the patient's life? A woman cannot have anything much more intimate to tell than the story of her wedding night. Is it a matter of chance and of no further significance that we have arrived precisely at the intimacies of sexual life? No doubt it might be the result of the choice I have made on this occasion. Do not let us be too hasty in forming our judgement, and let us turn to my second example, which is of quite a different kind – a sample of a very common species, a sleep ceremonial.

A nineteen-year-old girl, well developed and gifted, was the only child of parents to whom she was superior in education and intellectual liveliness. As a child she had been wild and high spirited, and in the course of the last few years had changed, without any visible cause, into a neurotic. She was very irritable, particularly towards her mother, always dissatisfied and depressed, and inclined to indecisiveness and doubt; finally she admitted that she was no longer able to walk by herself across squares or along comparatively wide streets. We will not concern ourselves much with her complicated illness, which called for at least two diagnoses – agoraphobia and obsessional neurosis – but will dwell only on the fact that she also developed a sleep ceremonial, with which she tormented her parents. In a certain sense it may be said that every normal person has his sleep ceremonial or that he has established certain necessary conditions the non-fulfilment of which interferes with his going to sleep; he has imposed certain forms on the transition from the waking to the sleeping state and repeats them in the same manner every evening. But everything that a healthy person requires as a necessary condition for sleep can be understood rationally, and if external circumstances call for a change he will comply easily and without waste

1 [Freud had given a shorter account of this case, though with some further details, in his paper on 'Obsessive Actions and Religious Practices' (1907*b*), *RSE*, **9**, 100–1.]

of time. A pathological ceremonial, however, is unyielding and insists on being carried through, even at the cost of great sacrifices; it too is screened by having a rational basis and at a superficial glance seems to diverge from the normal only by a certain exaggerated meticulousness. On closer examination, nevertheless, we can see that the screen is insufficient, that the ceremonial comprises some stipulations which go far beyond its
[265] rational basis and others which positively run counter to it. Our present patient put forward as a pretext for her nightly precautions that she needed quiet in order to sleep and must exclude every source of noise. With that end in view she did two kinds of things. The big clock in her room was stopped, all the other clocks or watches in the room were removed, and her tiny wrist-watch was not allowed even to be inside her bedside table. Flower pots and vases were collected on the writing table so that they might not fall over in the night and break, and disturb her in her sleep. She was aware that these measures could find only an *ostensible* justification in the rule in favour of quiet: the ticking of the little watch would not have been audible even if it had been left lying on the top of the bedside table, and we have all had experience of the fact that the regular ticking of a pendulum clock never disturbs sleep but acts, rather, as a soporific. She admitted too that her fear that flower pots and vases, if they were left in their places, might fall over and break of their own accord lacked all plausibility. In the case of other stipulations made by the ceremonial the need for quiet was dropped as a basis. Indeed, the requirement that the door between her room and her parents' bedroom should stay half open – the fulfilment of which she ensured by placing various objects in the open doorway – seemed on the contrary to act as a source of disturbing noises. But the most important stipulations related to the bed itself. The pillow at the top end of the bed must not touch the wooden back of the bedstead. The small top pillow must lie on this large pillow in one specific way only – namely, so as to form a diamond shape. Her head had then to lie exactly along the long diameter of the diamond. The eiderdown (or '*Duchent*' as we call it in Austria[1]) had to be shaken before being laid on the bed so that its bottom end became very thick; afterwards, however, she never failed to even out this accumulation of feathers by pressing them apart.

With your leave I will pass over the remaining, often very trivial, details of the ceremonial; they would teach us nothing new, and would
[266] lead us too far afield from our aims. But you must not overlook the fact

1 [In Germany the French word '*duvet*' is usual. This object is normally an undivided bag of feathers, not, as in England, quilted into a number of separate compartments.]

that all this was not carried out smoothly. There was always an apprehension that things might not have been done properly. Everything must be checked and repeated, doubts assailed first one and then another of the safety measures, and the result was that one or two hours were spent, during which the girl herself could not sleep and would not allow her intimidated parents to sleep either.

The analysis of these torments did not proceed so simply as that of our earlier patient's obsessional action. I was obliged to give the girl hints and propose interpretations, which were always rejected with a decided 'no' or accepted with contemptuous doubt. But after this first reaction of rejection there followed a time during which she occupied herself with the possibilities put before her, collected associations to them, produced recollections and made connections, until by her own work she had accepted all the interpretations. In proportion as this happened, she relaxed the performance of her obsessional measures, and even before the end of the treatment she had given up the whole ceremonial. You must understand, too, that the work of analysis as we carry it out today quite excludes the systematic treatment of any individual symptom till it has been entirely cleared up. We are, on the contrary, obliged to keep on leaving any particular topic, in the certain expectation of coming back to it again in other connections. The interpretation of her symptoms which I am about to give you is accordingly a synthesis of findings which were arrived at, interrupted by other work, over a period of weeks and months.

Our patient gradually came to learn that it was as symbols of the female genitals that clocks were banished from her equipment for the night. Clocks and watches – though elsewhere we have found other symbolic interpretations for them[1] – have arrived at a genital role owing to their relation to periodic processes and equal intervals of time. A woman may boast that her menstruation behaves with the regularity of clockwork. Our patient's anxiety, however, was directed in particular against being disturbed in her sleep by the ticking of a clock. The ticking of a clock may be compared with the knocking or throbbing in the [267]
clitoris during sexual excitement[2] [*Erregung*][T]. She had in fact been repeatedly woken from her sleep by this sensation, which had now become distressing to her; and she gave expression to this fear of an erection in the rule that all clocks and watches that were going should be

1 [Another reason for the dislike of clocks and watches felt by obsessional neurotics is mentioned in the 'Rat Man' analysis (1909*d*), *RSE*, **10**, 176.]

2 [Freud had reported a similar connection in his paper on a case of paranoia (1915*f*), ibid., **14**, 267 f.]

removed from her neighbourhood at night. Flower pots and vases, like all vessels [Vol. 15, p. 136 above], are also female symbols. Taking precautions against their falling and being broken at night was thus not without its good sense. We know the widespread custom of breaking a vessel or plate at betrothal ceremonies. Each man present gets hold of a fragment, and we may regard this as a sign of his resigning the claims he had upon the bride by virtue of a marriage regulation dating from before the establishment of monogamy.[1] In connection with this part of her ceremonial the girl produced a recollection and several associations. Once when she was a child she had fallen down while she was carrying a glass or china vase and had cut her finger and bled profusely. When she grew up and came to know the facts about sexual intercourse she formed an anxious idea that on her wedding night she would not bleed and would thus fail to show that she was a virgin. Her precautions against vases being broken thus meant a repudiation of the whole complex concerned with virginity and bleeding at the first intercourse – a repudiation equally of the fear of bleeding and of the contrary fear of not bleeding. These precautions, which she subsumed under her avoidance of noise, had only a remote connection with it.

She found out the central meaning of her ceremonial one day when she suddenly understood the meaning of the rule that the pillow must not touch the back of the bedstead. The pillow, she said, had always been a woman to her and the upright wooden back a man. Thus she wanted – by magic, we must interpolate – to keep the man and woman apart – that is, to separate her parents from each other, not to allow them to have sexual intercourse. In earlier years, before she had established the ceremonial,
[268] she had tried to achieve the same aim in a more direct way. She had simulated fear (or had exploited a tendency to fear which was already present) in order that the connecting doors between her parents' bedroom and the nursery should not be shut. This rule had, indeed, been retained in her present ceremonial. In that way she gave herself the opportunity of listening to her parents, but in making use of it she brought on an insomnia which lasted for months. Not satisfied with disturbing her parents by this means, she contrived to be allowed from time to time to sleep in her parents' bed between them. The 'pillow' and the 'wooden back' were thus really unable to come together. Finally, when she was so big that it became physically uncomfortable for her to find room in the bed between her parents, she managed, by a conscious simulation of anxiety, to arrange for her mother to exchange places with

1 [Cf. a reference to 'group marriage' in *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 16, and a discussion in 'The Taboo of Virginity' (1918*a*), ibid., **11**, 184 ff. and 186 *n*. 2.]

her for the night and to leave her own place so that the patient could sleep beside her father. This situation no doubt became the starting point of phantasies whose after-effect was to be seen in the ceremonial.

If a pillow was a woman, then the shaking of the eiderdown till all the feathers were at the bottom and caused a swelling there had a sense as well. It meant making a woman pregnant; but she never failed to smooth away the pregnancy again, for she had for years been afraid that her parents' intercourse would result in another child and so present her with a competitor. On the other hand, if the big pillow was a woman, the mother, then the small top pillow could only stand for the daughter. Why did this pillow have to be placed diamond-wise and her head precisely along its centre line? It was easy to recall to her that this diamond shape is the inscription scribbled on every wall to represent the open female genitals. If so, she herself was playing the man and replacing the male organ with her head. (Cf. the symbolism of beheading for castrating.)[1]

Wild thoughts, you will say, to be running through an unmarried girl's head. I admit that this is so. But you must not forget that I did not make these things but only interpreted them. A sleep ceremonial like this is a strange thing too,[2] and you will not fail to see how the ceremonial [269] corresponds to the phantasies which are revealed by the interpretation. But I attach more importance to your noticing that what was seen in the ceremonial was a precipitate not of a *single* phantasy but of a number of them, though they had a nodal point somewhere, and, further, that the rules laid down by the ceremonial reproduced the patient's sexual wishes at one point positively and at another negatively – in part they represented them, but in part they served as a defence against them.

More could be made, too, of the analysis of this ceremonial if it could be properly linked up with the patient's other symptoms. But our path does not lead in that direction. You must be content with a hint that the girl was in the grip of an erotic attachment to her father whose beginnings went back to her childhood. Perhaps that was why she behaved in such an unfriendly way to her mother [p. 233 above]. Nor can we overlook the fact that the analysis of this symptom has once again taken us back to a patient's sexual life. We shall perhaps be less surprised at this the more often we gain an insight into the sense and intention of neurotic symptoms.

1 [See Freud's paper on this subject (1916–17*c*), which includes a short reference to the present case, *RSE*, **14**, 341 ff.]

2 [An almost equally elaborate sleep ceremonial had been reported by Freud long before, in his second paper on the neuropsychoses of defence (1896*b*), ibid., **3**, 181–2 *n*.]

I have shown you, then, on the basis of two chosen examples, that neurotic symptoms have a sense, like parapraxes and dreams, and that they have an intimate connection with the patient's experiences. Can I expect you to believe this extremely important thesis on the evidence of two examples? No. But can you require me to go on giving you further examples till you declare yourselves convinced? No, once more. For, in view of the detailed fashion in which I deal with each single case, I should have to devote a five-hour course of lectures to settling this one point in the theory of the neuroses. So I must be content with having given you a trial proof of my assertion and, for the rest, I refer you to the reports given in the literature of the subject – to the classical interpretations of symptoms in Breuer's first case (of hysteria),[1] to the striking light thrown upon the most obscure symptoms of what is known as dementia praecox by C. G. Jung [1907], at a time when he was merely a psychoanalyst and had not yet aspired to be a prophet, and all the other papers that have
[270] since then filled our periodicals. There has been no lack of investigations precisely on these lines. The analysis, interpretation and translation of neurotic symptoms proved so attractive to psychoanalysts that for a time they neglected the other problems of neurosis.

If any of you undertakes exertions of this kind, he will certainly gain a powerful impression of the wealth of evidential material. But he will also come up against a difficulty. The sense of a symptom lies, as we have found, in some connection with the patient's experience. The more individual is the form of the symptom the more reason we shall have for expecting to be able to establish this connection. The task is then simply to discover, in respect to a senseless idea and a pointless action, the past situation in which the idea was justified and the action served a purpose. The obsessional action of our patient who ran to the table and rang for the housemaid is a perfect model of this kind of symptom. But there are – and they are very frequent – symptoms of quite another character. They must be described as 'typical' symptoms of an illness; they are approximately the same in all cases, individual distinctions disappear in them or at least shrink up to such an extent that it is difficult to bring them into connection with the patients' individual experience and to relate them to particular situations they have experienced. Let us look once more at obsessional neurosis. The sleep ceremonial of our second patient already has much that is typical about it, though at the same time it has enough individual traits to make what I might call a

1 [Included in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 19 ff.]

'historical' interpretation possible. But all these obsessional patients have a tendency to repeat, to make their performances rhythmical and to keep them isolated from other actions. The majority of them wash too much. Patients who suffer from agoraphobia (topophobia or fear of spaces), which we no longer regard as obsessional neurosis but describe as 'anxiety hysteria', often repeat the same features in their symptoms with wearisome monotony: they are afraid of enclosed spaces, of large open squares, of lengthy roads and streets. They feel protected if they are accompanied by an acquaintance or followed by a vehicle, and so on. On this similar background, however, different patients nevertheless display their individual requirements – whims, one is inclined to say – which in some cases contradict one another directly. One patient avoids only narrow streets and another only wide ones; one can go out only if there are few people in the street, [271]
another only if there are many. In the same way, hysteria, in spite of its wealth of individual traits, has a superfluity of common, typical symptoms, which seem to resist any easy historical derivation. And we must not forget that it is these typical symptoms, indeed, which give us our bearings when we make our diagnosis. Suppose, in a case of hysteria, we have really traced a typical symptom back to an experience or a chain of similar experiences – a case of hysterical vomiting, for instance, to a series of disgusting impressions – then we are at a loss when the analysis in a similar case of vomiting reveals a series of a quite different kind of ostensibly effective experiences. It looks, then, as though for unknown reasons hysterical patients are bound to produce vomiting and as though the historical precipitating causes revealed by analysis were only pretexts which, if they happen to be there, are exploited by this internal necessity.

So we are now faced with the depressing discovery that, though we can give a satisfactory explanation of the individual neurotic symptoms by their connection with experiences, our skill leaves us in the lurch when we come to the far more frequent typical symptoms. Furthermore, I am far from having made you acquainted with all the difficulties that arise when consistently pursuing the historical interpretation of symptoms. Nor do I intend to do so; for, though it is my intention not to gloss things over to you or conceal them, I cannot throw you into perplexity and confusion at the very beginning of our common studies. It is true that we have only made a beginning with our efforts at understanding the significance of symptoms; but we will hold fast to what we have achieved and pursue our way step by step to a

mastery of what we have not yet understood. I will try to console you, therefore, with the reflection that any fundamental distinction between one kind of symptom and the other is scarcely to be assumed. If the individual symptoms are so unmistakably dependent on the patient's experience, it remains possible that the typical symptoms may go back to an experience which is in itself typical – common to all human beings. Other features which recur regularly in neuroses may be general reactions which are imposed on the patients by the nature of their
[272] pathological change, like the repetitions or doubts in obsessional neurosis. In short, we have no grounds for premature despair; we shall see what remains to be seen.

A quite similar difficulty faces us in the theory of dreams. I could not deal with it in our earlier discussions on dreams. The manifest content of dreams is of the greatest diversity and individual variety, and we have shown in detail what one derives from this content by means of analysis. But alongside of these there are dreams which equally deserve to be called 'typical', which happen in everyone in the same way, dreams with a uniform content, which offer the same difficulties to interpretation. They are dreams of falling, flying, floating, swimming, of being inhibited [*Gehemmtsein*], of being naked and certain other anxiety dreams – which lead, in different people, now to this and now to that interpretation, without any light being thrown on their monotony and typical occurrence. But in these dreams too we observe that this common background is enlivened by additions that vary individually; and it is probable that, with a widening of our knowledge, it will be possible, without constraint, to include these dreams too in the understanding of dream life which we have acquired from other dreams.[1]

1 [See the section on 'typical' dreams in *I. of D.*, **4**, Chapter V (D).]

LECTURE XVIII

FIXATION TO TRAUMAS – THE UNCONSCIOUS

Ladies and Gentlemen, in my last lecture I expressed a desire that our work should go forward on the basis not of our doubts but of our discoveries. We have not yet had any discussion of two of the most interesting implications that follow from our two sample analyses. [273]

To take the first of these. Both patients give us an impression of having been 'fixated' to a particular portion of their past, as though they could not manage to free themselves from it and were for that reason alienated from the present and the future. They then remained lodged in their illness in the sort of way in which in earlier days people retreated into a monastery in order to bear the burden there of their ill-fated lives. What had brought this fate upon our first patient was the marriage which she had in real life abandoned. By means of her symptoms she continued to carry on her dealings with her husband. We learnt to understand the voices that pleaded for him, that excused him, that put him on a pedestal and that lamented his loss. Although she was young and desirable to other men, she had taken every precaution, real and imaginary (magical), to remain faithful to him. She did not show herself to strangers and she neglected her personal appearance; furthermore, once she had sat down in a chair she was unable to get out of it quickly,[1] she refused to sign her name, and she could not make any presents, on the ground that no-one ought to receive anything from her.

The same effect was produced on the life of our second patient, the young girl, by an erotic attachment to her father which had started during the years before her puberty. The conclusion she herself drew was that she could not marry as long as she was so ill. We, however, may suspect that she had become so ill in order not to have to marry and in order to remain with her father.

We cannot dismiss the question of why, in what way and for what [274]

1 [This symptom is further described and explained in Freud's other account of the case (1907*b*), *RSE*, **9**, 100.]

motive a person can arrive at such a remarkable attitude to life and one that is so inexpedient – assuming that this attitude is a general characteristic of neuroses and not a special peculiarity of these two patients. And in fact it is a general feature, of great practical importance, in every neurosis. Breuer's first hysterical patient [p. 227 above] was similarly fixated to the period when she was nursing her father in a serious illness. In spite of her recovery, in a certain respect she remained cut off from life; she remained healthy and efficient but avoided the normal course of a woman's life.[1] In every one of our patients, analysis shows us that they have been carried back to some particular period of their past by the symptoms of their illness or their consequences. In the majority of cases, indeed, a very early phase of life is chosen for the purpose – a period of their childhood or even, laughable as this may sound, of their existence as an infant at the breast.

The closest analogy to this behaviour of our neurotics is afforded by illnesses which are being produced with special frequency precisely at the present time by the war – what are described as traumatic neuroses. Similar cases, of course, appeared before the war as well, after railway collisions and other alarming accidents involving fatal risks. Traumatic neuroses are not in their essence the same thing as the spontaneous neuroses which we are in the habit of investigating and treating by analysis; nor have we yet succeeded in bringing them into harmony with our views, and I hope I shall be able at some time to explain to you the reason for this limitation.[2] But in one respect we may insist that there is a complete agreement between them. The traumatic neuroses give a clear indication that a fixation to the moment of the traumatic accident lies at their root. These patients regularly repeat the traumatic situation in their dreams;[3] where hysteriform attacks that admit of an
[275] analysis occur, we find that the attack corresponds to a complete transplanting of the patient into the traumatic situation.[4] It is as though these patients had not finished with the traumatic situation, as though they were still faced with it as an immediate task which has not been dealt with; and we take this view quite seriously. It shows us the way to what

1 [Anna O. was never married. See Jones, 1953, 247–8.]

2 [Traumatic neuroses are mentioned again on p. 336 below. Freud was later able to throw more light on the war neuroses (1919*d*), *RSE*, **17**, 203 ff.]

3 [This particular point played a part in Freud's first discussion of the 'compulsion to repeat' a few years later. See *Beyond the Pleasure Principle* (1920*g*), ibid., **18**, 13 and 22 f.]

4 [This was already recognized in Section IV of the Breuer & Freud 'Preliminary Communication' (1893*a*), ibid., **2**, 12.]

we may call an *economic* view of mental processes.[1] Indeed, the term 'traumatic' has no other sense than an economic one. We apply it to an experience which within a short period of time presents the mind with an increase of stimulus too powerful to be dealt with or worked off in the normal way, and this must result in permanent disturbances of the manner in which the energy operates.

This analogy is bound to tempt us to describe as traumatic those experiences too to which our neurotic patients seem to be fixated. This would promise to offer us a simple determinant for the onset of neurosis. Neurosis could then be equated with a traumatic illness and would come about owing to inability to deal with an experience whose affective colouring was excessively powerful. And this indeed was actually the first formula in which (in 1893 and 1895) Breuer and I accounted theoretically for our new observations.[2] A case like that of the first of the two patients in my last lecture – the young married woman separated from her husband – fits in very well with this view. She had not got over the failure of her marriage and remained attached to that trauma. But our second case – that of the girl with a fixation upon her father – shows us already that the formula is not sufficiently comprehensive. On the one hand, a little girl's being in love like this with her father is something so common and so frequently surmounted that the term 'traumatic' applied to it would lose all its meaning; and, on the other hand, the patient's history showed us that in the first instance her erotic fixation appeared to have passed off without doing any damage, and it was only several years later that it reappeared in the symptoms of the obsessional neurosis. Here, then, we foresee complications, a greater wealth of determinants [276]
for the onset of illness; but we may also suspect that there is no need to abandon the traumatic line of approach as being erroneous: it must be possible to fit it in and subsume it somewhere else.

Here once more, then, we must break off the course we have started on. For the moment it leads no further and we shall have to learn all kinds of other things before we can find its proper continuation.[3] But on the subject of fixation to a particular phase in the past we may add that such behaviour is far more widespread than neurosis. Every neurosis includes a fixation of that kind, but not every fixation leads to a neurosis, coincides with a neurosis or arises owing to a neurosis. A perfect model

1 [Freud returns to this later (p. 313 f. below).]

2 [See, for instance, Section II of the Breuer & Freud 'Preliminary Communication' (1893*a*), and in particular its last two paragraphs, *RSE*, **2**, 10.]

3 [The subject is taken up again in Lecture XXII, p. 299 ff. below.]

of an affective fixation to something that is past is provided by mourning, which actually involves the most complete alienation from the present and the future. But even the judgement of a layman will distinguish sharply between mourning and neurosis. There are, on the other hand, neuroses which may be described as a pathological form of mourning.[1]

It may happen, too, that a person is brought so completely to a stop by a traumatic event which shatters the foundations of his life that he abandons all interest in the present and future and remains permanently absorbed in mental concentration upon the past. But an unfortunate such as this need not on that account become a neurotic. We will not attach too much value to this one feature, therefore, in characterizing neurosis, however regularly present and however important it may usually be.

Let us turn now to the second of the discoveries which follow from our analyses; in its case we need not fear having to make a subsequent qualification of our views. I have described to you how our first patient carried out a senseless obsessional action and how she reported an intimate memory from her past life as having some connection with it: and how
[277] afterwards I examined the connection between the two and discovered the intention of the obsessional action from its relation to the memory. But there is one factor which I have entirely neglected, though it deserves our fullest attention. However often the patient repeated her obsessional action, she knew nothing of its being derived from the experience she had had. The connection between the two was hidden from her; she could only quite truthfully reply that she did not know what it was that was making her carry out her action. Then suddenly one day, under the influence of the treatment, she succeeded in discovering the connection and reported it to me. But she still knew nothing of the intention with which she was performing the obsessional action – the intention of correcting a distressing portion of the past and of putting her beloved husband in a better light. It took a fairly long time and called for much labour before she understood and admitted to me that such a motive alone could have been the driving force of her obsessional action.

The link with the scene after her unhappy wedding night and the patient's affectionate motive constituted, taken together, what we have called the 'sense' of the obsessional action. But while she was carrying

1 [See on this Freud's metapsychological paper 'Mourning and Melancholia' (1916–17*g* [1915]), *RSE*, **14**, actually published after the delivery of this lecture, though written two years earlier. A short reference to melancholia appears in Lecture XXVI, p. 377 below.]

out the obsessional action this sense had been unknown to her in both directions – both its 'whence' and its 'whither'. [Cf. p. 251 below.] Mental processes had therefore been at work in her and the obsessional action was the effect of them; she had been aware of this effect in a normal mental fashion, but none of the mental predeterminants of this effect came to the knowledge of her consciousness. She behaved in precisely the same way as a hypnotized subject whom Bernheim had ordered to open an umbrella in the hospital ward five minutes after he woke up. The man carried out this instruction when he was awake, but he could produce no motive for his action.[1] It is a state of affairs of this sort that we have before our eyes when we speak of the existence of *unconscious mental processes*. We can challenge anyone in the world to give a more correct scientific account of this state of affairs, and if he does we will gladly renounce our hypothesis of unconscious mental processes. Till that happens, however, we will hold fast to the hypothesis; and if [278] someone objects that here the unconscious is nothing real in a scientific sense, is a makeshift, *une façon de parler*, we can only shrug our shoulders resignedly and dismiss what he says as unintelligible. Something not real, which produces effects of such tangible reality as an obsessional action![2]

And we meet with what is in essence the same thing in our second patient. She had made a rule that the pillow must not touch the back of the bedstead, and she had to obey this rule though she did not know where it came from, what it meant or to what motives it owed its power [*Macht*][T]. Whether she herself regarded the rule as a matter of indifference, or whether she struggled against it or raged against it or decided to transgress it – none of this made any difference to her carrying it out. It had to be obeyed, and she asked herself vainly why. We must recognize, however, that these symptoms of obsessional neurosis, these ideas [*Vorstellungen*] and impulses [*Impulsen*] which emerge one knows not whence, which prove so resistant to every influence from an otherwise normal mind, which give the patient himself the impression of being all-powerful guests from an alien world, immortal beings intruding into the turmoil of mortal life – these symptoms offer the plainest indication of there being a special region of the mind, shut off from the rest. They lead, by a path that cannot be missed, to a conviction of the existence of the unconscious in the mind; and that is precisely why clinical psychiatry,

1 [Freud gave a much fuller account of this episode, at which he himself was present, in his last, unfinished, paper 'Some Elementary Lessons in Psycho-Analysis' (1940*b* [1938]), *RSE*, **23**, 267. See also above, Vol. 15, p. 90 f.]

2 [Cf. above, p. 227.]

which is acquainted only with a psychology of consciousness, can deal with these symptoms in no other way than by declaring them to be signs of a special sort of degeneracy. Obsessional ideas and obsessional impulses are not, of course, themselves unconscious, any more than the performance of obsessional actions escapes conscious perception. They would not have become symptoms if they had not forced their way into consciousness. But their psychical predeterminants which we infer by means of analysis, the connections into which we insert them by interpretation, are unconscious, at least until we have made them conscious to the patient by the work of analysis.

If, now, you consider further that the state of affairs which we have established in our two cases is confirmed for every symptom of every
[279] neurotic illness – that always and everywhere the sense of the symptoms is unknown to the patient and that analysis regularly shows that these symptoms are derivatives of unconscious processes but can, subject to a variety of favourable circumstances, be made conscious – if you consider this, you will understand that in psychoanalysis we cannot do without what is at the same time unconscious and mental, and are accustomed to operate with it as though it were something palpable to the senses. But you will understand as well, perhaps, how incapable of forming a judgement on this question are all those other people, who are only acquainted with the unconscious as a concept, who have never carried out an analysis and have never interpreted dreams or found a sense and intention in neurotic symptoms. To say it for our ends once again: the possibility of giving a sense to neurotic symptoms by analytic interpretation is an unshakeable proof of the existence – or, if you prefer it, of the necessity for the hypothesis – of unconscious mental processes.

But that is not all. Thanks to a second discovery of Breuer's, which seems to me even more significant than the other [p. 227 above] and which he shared with no-one, we learn still more of the connection between neurotic symptoms and the unconscious. Not only is the sense of the symptoms regularly unconscious, but there is an inseparable relation between this fact of the symptoms being unconscious and the possibility of their existing. You will understand me in a moment. I follow Breuer in asserting that every time we come upon a symptom we can infer that there are certain definite unconscious processes in the patient which contain the sense of the symptom. But it is also necessary for that sense to be unconscious in order that the symptom can come about. Symptoms are never constructed [*gebildet*] from conscious processes; as soon as the unconscious processes concerned have become conscious,

the symptom must disappear. Here you will at once perceive a means of approach to therapy, a way of making symptoms disappear. And in this way Breuer did, in fact, restore his hysterical patient – that is, freed her from her symptoms; he found a technique for bringing to her consciousness the unconscious processes which contained the sense of the symptoms, and the symptoms disappeared.

This discovery of Breuer's was not the result of speculation but of a fortunate observation made possible by the patient's cooperation.[1] Nor should you torment yourselves with attempts at understanding it by tracing it back to something already known; you should recognize in it a new fundamental fact, by whose help much else will become explicable. Allow me, therefore, to repeat the same thing to you in another way. [280]

The construction of a symptom [*Symptombildung*] is a substitute for something else that did not happen. Some particular mental processes should normally have developed to a point at which consciousness received information of them. This, however, did not take place, and instead – out of the interrupted processes, which had been somehow disturbed and were obliged to remain unconscious – the symptom emerged. Thus something in the nature of an exchange has taken place; if this can be reversed the therapy of the neurotic symptoms will have achieved its task.

This discovery of Breuer's is still the foundation of psychoanalytic therapy. The thesis that symptoms disappear when we have made their unconscious predeterminants conscious has been confirmed by all subsequent research, although we meet with the strangest and most unexpected complications when we attempt to carry it through in practice. Our therapy works by transforming what is unconscious into what is conscious, and it works only insofar as it is in a position to effect that transformation.

And now I must quickly make a short digression, to avoid the risk of your imagining that this therapeutic work is accomplished too easily. From what I have so far said a neurosis would seem to be the result of a kind of ignorance – a not knowing about mental events that one ought to know of. This would be a close approximation to some well-known Socratic doctrines, according to which even vices are based on ignorance. Now it would as a rule be very easy for a doctor experienced in analysis to guess what mental impulses [*Regungen*] had remained unconscious in a particular patient. So it ought not to be very difficult, either,

1 [Breuer's description of the occurrence can be found in his case history of Anna O. in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 31–3.]

for him to restore the patient by communicating his knowledge to him and so remedying his ignorance. One part at least of the symptom's unconscious sense could be easily dealt with in this way, though it is true that the doctor cannot guess much about the other part – the connection
[281] between the symptoms and the patient's experiences – since he himself does not know those experiences but must wait till the patient remembers them and tells them to him. But even for this a substitute can in some instances be found. One can make enquiries about these experiences from the patient's relatives and they will often be able to recognize which of them had a traumatic effect, and they can even sometimes report experiences of which the patient himself knows nothing because they occurred at a very early period of his life. Thus, by combining these two methods, we should have a prospect of relieving the patient of his pathogenic ignorance with little expense of time or trouble.

If only that was how things happened! We came upon discoveries in this connection for which we were at first unprepared. Knowledge is not always the same as knowledge: there are different sorts of knowledge, which are far from equivalent psychologically. 'Il y a fagots et fagots', as Molière has said.[1] The doctor's knowledge is not the same as the patient's and cannot produce the same effects. If the doctor transfers [*überträgt*] his knowledge to the patient as a piece of information, it has no result. No, it would be wrong to say that. It does not have the result of removing the symptoms, but it has another one – of setting the analysis in motion, of which the first signs are often expressions of denial [*Widersprüches*]. The patient knows after this what he did not know before – the sense of his symptom; yet he knows it just as little as he did. Thus we learn that there is more than one kind of ignorance. We shall need to have a somewhat deeper understanding of psychology to show us in what these differences consist.[2] But our thesis that the symptoms vanish when their sense is known remains true in spite of this. All we have to add is that the knowledge must rest on an internal change in the patient such as can only be brought about by a piece of psychical work with a particular aim. We are faced here with problems which will presently be brought together into the *dynamics* of the construction of symptoms.

I must ask now, gentlemen, whether what I am saying to you is not too obscure and complicated. Am I not confusing you by so often taking back what I have said or qualifying it – by starting up trains of thought and
[282] then dropping them? I should be sorry if that were so. But I have a strong

1 [*Le médecin malgré lui*, I, 5.]

2 [Freud returns to this question in Lecture XXVII, p. 385 f. below.]

dislike of simplifying things at the expense of truthfulness. I have no objection to your receiving the full impact of the manysidedness and complexity of our subject; and I think, too, that it does no harm if I tell you more on every point than you can at the moment make use of. I am aware, after all, that every listener or reader puts what is presented to him into shape in his mind, shortens it and simplifies it, and selects from it what he would like to retain. Up to a certain point it is no doubt true that the more there is at one's disposal the more one is left with. Permit me to hope that, in spite of all the trimmings, you have clearly grasped the essential part of what I have told you – about the sense of symptoms, about the unconscious and about the relation between them. No doubt you have also understood that our further efforts will lead in two directions: first towards discovering how people fall ill and how they can come to adopt the neurotic attitude to life – which is a clinical problem; and secondly towards learning how the pathological symptoms develop from the determinants of the neurosis – which remains a problem of mental dynamics. There must, moreover, be a point somewhere at which the two problems converge.

I will not go into this any further today. But since we still have some time to spare, I should like to direct your attention to another characteristic of our two analyses, which, once again, it will only be possible to appreciate fully later on – to the gaps in the patients' memories, their amnesias. As you have heard [p. 247 above], the task of a psychoanalytic treatment can be expressed in this formula: its task is to make conscious everything that is pathogenically unconscious. You will perhaps be surprised to learn, then, that this formula can be replaced with another one: its task is to fill in all the gaps in the patient's memory, to remove his amnesias [cf. Vol. 15, p. 174 above]. This would amount to the same thing. We are thus implying that the amnesias of neurotic patients have an important connection with the origin of their symptoms. If, however, you consider the case of our first analysis you will not find this view of amnesia justified. The patient had *not* forgotten the scene from which her obsessive action was derived; on the contrary, she had a vivid recollection of it; nor did [283]
anything else forgotten play a part in the origin of the symptom. The position with our second patient (the girl with the obsessional ceremonial), though less clear, was on the whole analogous. She had not really forgotten her behaviour in earlier years – the fact that she had insisted on the door between her parents' bedroom and her own being left open and that she had driven her mother out of her place in her

parents' bed; she remembered this very plainly, even though with hesitation and unwillingly. The only thing we can consider striking is that the first patient, in carrying out her obsessional action on countless occasions, had never *once* noticed its resemblance to her experience on her wedding night, and that the memory of it did not occur to her when she was directly asked to look for the motives of her obsessional action. And the same thing applies to the girl, whose ceremonial and its causes were moreover connected with a situation which was identically repeated every evening.[1] In both these cases there was no true amnesia, no missing memory; but a connection had been broken which ought to have led to the reproduction or re-emergence of the memory.

A disturbance of memory of this kind is enough for obsessional neurosis; but the case is different with hysteria. As a rule the latter neurosis is marked by amnesias on a really large scale. In analysing each separate hysterical symptom one is usually led to a whole chain of impressions of events, which, when they recur, are expressly described by the patient as having been till then forgotten. On the one hand, this chain reaches back to the earliest years of life, so that the hysterical amnesia can be recognized as an immediate continuation of the infantile amnesia which, for us normal people, conceals the beginnings of our mental life. [Cf. Vol. 15, p. 173 f. above.] On the other hand, we learn with astonishment that even the patient's most recent experiences can be subject to forgetting, and that the occasions which precipitated the outbreak of the illness or led to its intensification are in particular encroached upon, if not completely swallowed up, by amnesia. It regularly happens that important details have disappeared from the total picture of a recent recollection of this sort or that they have been replaced by falsifications
[284] of memory. Indeed it happens with almost equal regularity that certain memories of recent experiences emerge only shortly before the end of an analysis – memories which had been held back till that late moment and had left perceptible gaps in the continuity of the case.

Such restrictions upon the faculty of memory are, as I have said, characteristic of hysteria, in which, indeed, states also arise as symptoms – hysterical attacks – which need leave no trace behind them in the memory. If things are different in obsessional neurosis, you may conclude that what we are dealing with in these amnesias is a psychological characteristic of the change that occurs in hysteria and is not a universal feature of neuroses in general. The importance of this distinction is reduced by the following consideration. We have comprised two things

1 [I.e. her father and mother sleeping together.]

as the 'sense' of a symptom: its 'whence' and its 'whither' or 'what for' [p. 245 above] – that is, the impressions and experiences from which it arose and the intentions which it serves. Thus the 'whence' of a symptom resolves itself into impressions which came from outside, which were necessarily once conscious and may have since become unconscious through forgetting. The 'whither' of a symptom, its purpose [*Tendenz*], is invariably, however, an endopsychic process, which may possibly have been conscious at first but may equally well never have been conscious and may have remained in the unconscious from the very start. Thus it is not of great importance whether the amnesia has laid hold on the 'whence' as well – the experiences on which the symptom is supported – as happens in hysteria; it is on the 'whither', the purpose of the symptom, which may have been unconscious from the beginning, that its dependence on the unconscious is founded – and no less firmly in obsessional neurosis than in hysteria.

But in thus emphasizing the unconscious in mental life we have conjured up the most evil spirits of criticism against psychoanalysis. Do not be surprised at this, and do not suppose that the resistance to us rests only on the understandable difficulty of the unconscious or the relative inaccessibility of the experiences which provide evidence of it. Its source, I think, lies deeper. In the course of centuries the naive self-love of men has had to submit to two major blows at the hands of science. The first was when they learnt that our earth was not the centre of the [285]
universe but only a tiny fragment of a cosmic system of scarcely imaginable vastness. This is associated in our minds with the name of Copernicus, though something similar had already been asserted by Alexandrian science. The second blow fell when biological research destroyed man's supposedly privileged place in creation and proved his descent from the animal kingdom and his ineradicable animal nature. This revaluation has been accomplished in our own days by Darwin, Wallace and their predecessors, though not without the most violent contemporary opposition. But human megalomania will have suffered its third and most wounding blow from the psychological research of the present time which seeks to prove to the ego that it is not even master in its own house, but must content itself with scanty information of what is going on unconsciously in its mind. We psychoanalysts were not the first and not the only ones to utter this call to introspection; but it seems to be our fate to give it its most forcible expression and to support it with empirical material which affects every individual. Hence arises the

general revolt against our science, the disregard of all considerations of academic civility and the releasing of the opposition from every restraint of impartial logic.[1] And beyond all this we have yet to disturb the peace of this world in still another way, as you will shortly hear.

1 [Freud had developed this theme at greater length in a paper on 'A Difficulty in the Path of Psychoanalysis' (1917*a*), *RSE*, **17**, 129 ff.]

LECTURE XIX

RESISTANCE AND REPRESSION[1]

Ladies and Gentlemen, before we can make any further progress in our [286]
understanding of the neuroses, we stand in need of some fresh observations. Here we have two such, both of which are very remarkable and at the time when they were made were very surprising. Our discussions of last year will, it is true, have prepared you for both of them.[2]

In the first place, then, when we undertake to restore a patient to health, to relieve him of the symptoms of his illness, he meets us with a violent and tenacious resistance, which persists throughout the whole length of the treatment. This is such a strange fact that we cannot expect it to find much credence. It is best to say nothing about it to the patient's relatives, for they invariably regard it as an excuse on our part for the length or failure of our treatment. The patient, too, produces all the phenomena of this resistance without recognizing it as such, and if we can induce him to take our view of it and to reckon with its existence, that already counts as a great success. Only think of it! The patient, who is suffering so much from his symptoms and is causing those about him to share his sufferings, who is ready to undertake so many sacrifices in time, money, effort and self-discipline in order to be freed from those symptoms – we are to believe that this same patient puts up a struggle in the interest of his illness against the person who is helping him. How improbable such [287]
an assertion must sound! Yet it is true; and when its improbability is pointed out to us, we need only reply that it is not without analogies. A man who has gone to the dentist because of an unbearable toothache will

1 [The essence of Freud's views on repression is already given in his contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2**, 238–40. He gave a similar description of his discovery in his history of the psychoanalytic movement (1914*d*), ibid., **14**, 13. An account of the development of Freud's theory of repression can be found in the Editors' Note to his metapsychological paper on the subject (1915*d*), ibid., **14**, 127 ff. – a paper which, together with Section IV of the paper on 'The Unconscious' (1915*e*), ibid., **14**, 159 ff., contains Freud's deepest reflections on the question.]

2 [The concept of resistance had been introduced in Lecture VII, Vol. 15, p. 101 f. above. The second observation is described on p. 263 f. below.]

nevertheless try to hold the dentist back when he approaches the sick tooth with a pair of forceps.

The patient's resistance is of very many sorts, extremely subtle and often hard to detect; and it exhibits protean changes in the forms in which it manifests itself. The doctor must be distrustful and remain on his guard against it.

In psychoanalytic therapy we make use of the same technique that is familiar to you from dream interpretation. We instruct the patient to put himself into a state of quiet, unreflecting self-observation, and to report to us whatever internal perceptions he is able to make – feelings, thoughts, memories – in the order in which they occur to him. At the same time we warn him expressly against giving way to any motive which would lead him to make a selection among these associations [*Einfällen*] or to exclude any of them, whether on the ground that it is too *disagreeable* or too *indiscreet* to say, or that it is too *unimportant* or *irrelevant*, or that it is *nonsensical* and need not be said. We urge him always to follow only the surface of his consciousness and to leave aside any criticism of what he finds, whatever shape that criticism may take; and we assure him that the success of the treatment, and above all its duration, depends on the conscientiousness with which he obeys this fundamental technical rule of analysis.[1] We already know from the
[288] technique of dream interpretation that the associations giving rise to the doubts and objections I have just enumerated are precisely the ones that invariably contain the material which leads to the uncovering of the unconscious. [Cf. Lecture VII, Vol. 15, p. 101 above.]

The first thing we achieve by setting up this fundamental technical rule is that it becomes the target for the attacks of the resistance. The patient endeavours in every sort of way to extricate himself from its provisions. At one moment he declares that nothing occurs to him, at the next that so many things are crowding in on him that he cannot get hold of anything. Presently we observe with pained astonishment that

1 [Freud had already stated the rule in connection with the interpreting of dreams in Lecture VII, Vol. 15, p. 101 above. He first laid it down in Chapter II of *I. of D.*, **4**, 89–91, and again in his contribution to a book of Löwenfeld's (Freud, 1904*a* [1903]; *RSE*, **7**, 225). The actual term 'fundamental rule' was first used in the technical paper on 'The Dynamics of Transference' (1912*b*), ibid., **12**, 100, where an Editors' footnote gives some other early references. Perhaps the fullest account is in another technical paper, 'On Beginning the Treatment' (1913*c*), ibid., **12**, 131–3. Among later mentions may be noted a passage in Chapter IV of the *Autobiographical Study* (1925*d*), ibid., **20**, 35–6, and an interesting allusion to the deeper reasons for the obstacles to obeying the rule, in Chapter VI of *Inhibitions, Symptoms and Anxiety* (1926*d*), ibid., **20**, 107 f. In the latter passage, in the course of a discussion of the part played by the defensive process of 'isolation' in ordinary directed thinking, Freud mentions especially the difficulties felt by obsessional neurotics in this connection. See below, p. 255.]

he has given way first to one and then to another critical objection: he betrays this to us by the long pauses that he introduces into his remarks. He then admits that there is something he really cannot say – he would be ashamed to; and he allows this reason [*Motiv*] to prevail against his promise. Or he says that something has occurred [*eingefallen*] to him, but it concerns another person and not himself and is therefore exempt from being reported. Or, what has now occurred to him is really too unimportant, too silly and senseless: I cannot possibly have meant him to enter into thoughts like that. So it goes on in innumerable variations, and one can only reply that 'to say everything' really does mean 'to say everything'.

One hardly comes across a single patient who does not make an attempt at reserving some region or other for himself so as to prevent the treatment from having access to it. A man, whom I can only describe as of the highest intelligence, kept silence in this way for weeks on end about an intimate love affair, and, when he was called to account for having broken the sacred rule, defended himself with the argument that he thought this particular story was his private business. Analytic treatment does not, of course, recognize any such right of asylum. Suppose that in a town like Vienna the experiment was made of treating a square such as the Hohe Markt, or a church like St Stephen's, as places where no arrests might be made, and suppose we then wanted to catch a particular criminal. We could be quite sure of finding him in the sanctuary. I once decided to allow a man, on whose efficiency much depended in the external world, the right to make an exception of this [289] kind because he was bound under his oath of office not to make communications about certain things to another person. He, it is true, was satisfied with the outcome; but I was not. I determined not to repeat an attempt under such conditions.

Obsessional neurotics understand perfectly how to make the technical rule almost useless by applying their over-conscientiousness and doubts to it.[1] Patients suffering from anxiety hysteria occasionally succeed in carrying the rule *ad absurdum* by producing only associations which are so remote from what we are in search of that they contribute nothing to the analysis. But it is not my intention to induct you into the handling of these technical difficulties. It is enough to say that in the end, through resolution and perseverance, we succeed in extorting a certain amount of obedience to the fundamental technical rule from the resistance – which thereupon jumps over to another sphere.

1 [Cf. the end of footnote, p. 254 above.]

It now appears as an *intellectual* resistance, it fights by means of arguments and exploits all the difficulties and improbabilities which normal but uninstructed thinking finds in the theories of analysis. It is now our fate to hear from this single voice all the criticisms and objections which assail our ears in a chorus in the scientific literature of the subject. And for this reason none of the shouts that reach us from outside sounds unfamiliar. It is a regular storm in a teacup. But the patient is willing to be argued with; he is anxious to get us to instruct him, teach him, contradict him, introduce him to the literature, so that he can find further instruction. He is quite ready to become an adherent of psychoanalysis – on condition that analysis spares him personally. But we recognize this curiosity as a resistance, as a diversion from our particular tasks, and we repel it. In the case of an obsessional neurotic we have to expect special tactics of resistance. He will often allow the analysis to proceed on its way uninhibited, so that it is able to shed an ever-increasing light upon the riddle of his illness. We begin to wonder in the end, however, why this enlightenment is accompanied by no practical advance, no diminution of the symptoms. We are then able to realize that resistance has withdrawn on to the doubt belonging to the obsessional neurosis and from that position is successfully defying us. It is as
[290] though the patient were saying: 'Yes, that's all very nice and interesting, and I'll be very glad to go on with it further. It would change my illness a lot if it were true. But I don't in the least believe that it *is* true; and, so long as I don't believe it, it makes no difference to my illness.' Things can proceed like this for a long time, till finally one comes up against this uncommitted attitude itself, and the decisive struggle then breaks out.[1]

Intellectual resistances are not the worst: one always remains superior to them. But the patient also knows how to put up resistances, without going outside the framework of the analysis, the overcoming of which is among the most difficult of technical problems. Instead of remembering, he *repeats* attitudes and emotional impulses from his early life which can be used as a resistance against the doctor and the treatment by means of what is known as 'transference'[2] ['*Übertragung*'][T]. If the patient is a man, he usually extracts this material from his relation to his father, into whose place he fits the doctor, and in that way he makes resistances out of his efforts to become independent in himself and in his judgements, out of his ambition, the first aim of which was to do things as well as his

1 [The part played by doubt in cases of obsessional neurosis is referred to above in Lecture XVII, p. 229. The necessity for special technical methods in dealing with such cases was mentioned by Freud a little later in his Budapest Congress paper (1919*a*), *RSE*, **17**, 159.]

2 [Lecture XXVII, p. 381 ff. below, is devoted to a full discussion of this phenomenon.]

father or to get the better of him, or out of his unwillingness to burden himself for the second time in his life with a load of gratitude. Thus at times one has an impression that the patient has entirely replaced his better intention of making an end to his illness with the alternative one of putting the doctor in the wrong, of making him realize his impotence and of triumphing over him. Women have a masterly gift for exploiting an affectionate, erotically tinged transference to the doctor for the purposes of resistance. If this attachment reaches a certain height, all their interest in the immediate situation in the treatment and all the obligations they undertook at its commencement vanish; their jealousy, which is never absent, and their exasperation at their inevitable rejection, however considerately expressed, are bound to have a damaging effect on their personal understanding with the doctor and so [291] to put out of operation one of the most powerful driving forces [*Triebkräfte*][T] of the analysis.

Resistances of this kind should not be one-sidedly condemned. They include so much of the most important material from the patient's past and bring it back in so convincing a fashion that they become some of the best supports of the analysis if a skilful technique knows how to give them the right turn. Nevertheless, it remains a remarkable fact that this material is always in the service of the resistance to begin with and brings to the fore a façade that is hostile to the treatment. It may also be said that what is being mobilized for fighting against the alterations we are striving for are character traits, attitudes of the ego. In this connection we discover that these character traits were formed in relation to the determinants of the neurosis and in reaction against its demands, and we come upon traits which cannot normally emerge, or not to the same extent, and which may be described as latent. Nor must you get an impression that we regard the appearance of these resistances as an unforeseen risk to analytic influence. No, we are aware that these resistances are bound to come to light; in fact, we are dissatisfied if we cannot provoke them clearly enough and are unable to demonstrate them to the patient. Indeed we come finally to understand that the overcoming of these resistances is the essential function of analysis[1] and is the only part of our work which gives us an assurance that we have achieved something with the patient.

If you further consider that the patient makes all the chance events that occur during his analysis into interferences with it, that he uses as

1 [That this was a relatively late development in analytic technique is shown, for instance, by a paragraph in Freud's Nuremberg Congress paper (1910*d*), *RSE*, **11**, 131 f.]

reasons for slackening his efforts every diversion outside the analysis, every comment by a person of authority in his environment who is hostile to analysis, any chance organic illness or any that complicates his neurosis and, even, indeed, every improvement in his condition – if you consider all this, you will have obtained an approximate, though still incomplete, picture of the forms and methods of the resistance, the struggle against which accompanies every analysis.[1]

[292] I have treated this point in such great detail because I must now inform you that this experience of ours with the resistance of neurotics to the removal of their symptoms became the basis of our dynamic view of the neuroses. Originally Breuer and I myself carried out psychotherapy by means of hypnosis; Breuer's first patient[2] was treated throughout under hypnotic influence, and to begin with I followed him in this. I admit that at that period the work proceeded more easily and pleasantly, and also in a much shorter time. But results were capricious and not lasting; and for that reason I finally dropped hypnosis.[3] And I then understood that an insight into the dynamics of these illnesses had not been possible so long as hypnosis was employed.[4] That state was precisely able to withhold the existence of the resistance from the doctor's perception. It pushed the resistance back, making a certain area free for analytic work, and dammed it up at the frontiers of that area in such a way as to be impenetrable, just as doubt does in obsessional neurosis. For that reason I have been able to say that psychoanalysis proper began when I dispensed with the help of hypnosis.[5]

If, however, the recognition of resistance has become so important, we should do well to find room for a cautious doubt whether we have not been too light-heartedly assuming resistances. Perhaps there really are cases of neurosis in which associations fail for other reasons, perhaps the arguments against our hypotheses really deserve to have their content examined, and perhaps we are doing patients an injustice in so conveniently setting aside their intellectual criticisms as resistance. But,

1 [The present description of the forms taken by resistance in general is as full as any by Freud. But the special case of transference resistance is discussed in greater detail in his paper on 'The Dynamics of Transference' (1912*b*), *RSE*, **12**, 93 ff.]

2 [See Lecture XVIII, p. 246 f. above.]

3 [Fairly exact dates for Freud's use of hypnotism (1887–96) can be found in an Editors' footnote to the case of Lucy R. in *Studies on Hysteria* (1895*d*), *RSE*, **2**, 98 *n.*]

4 [Freud tells us that he first realized the great importance of resistance during his analysis of Elisabeth von R. He was at that time using the 'pressure' technique, without hypnosis. See *Studies on Hysteria* (1895*d*), ibid., **2**, 136 f.]

5 [Cf. Freud's statement in very similar words in his history of the psychoanalytic movement (1914*d*), ibid., **14**, 13. Earlier he had not been inclined to draw such a clear-cut line (cf. ibid., 5–6).]

gentlemen, we did not arrive at this judgement lightly. We have had [293]
occasion to observe all these critical patients at the moment of the emergence of a resistance and after its disappearance. For resistance is constantly altering its intensity during the course of a treatment; it always increases when we are approaching a new topic, it is at its most intense while we are at the climax of dealing with that topic, and it dies away when the topic has been disposed of. Nor do we ever, unless we have been guilty of special clumsiness in our technique, have to meet the full amount of resistance of which a patient is capable. We have therefore been able to convince ourselves that on countless occasions in the course of his analysis the same man will abandon his critical attitude and then take it up again. If we are on the point of bringing a specially distressing piece of unconscious material to his consciousness, he is extremely critical; he may previously have understood and accepted a great deal, but now it is just as though those acquisitions have been swept away; in his efforts for opposition at any price, he may offer a complete picture of someone who is an emotional imbecile. But if we succeed in helping him to overcome this new resistance, he recovers his insight and understanding. Thus his critical faculty is not an independent function, to be respected as such, it is the tool of his emotional attitudes and is directed by his resistance. If there is something he does not like, he can put up a shrewd fight against it and appear highly critical; but if something suits his book, he can, on the contrary, show himself most credulous. Perhaps none of us is very different; a man who is being analysed reveals this dependence of the intellect upon emotional life so clearly only because in analysis we are putting such great pressure on him.

How, then, do we account for our observation that the patient fights with such energy against the removal of his symptoms and the setting of his mental processes on a normal course? We tell ourselves that we have succeeded in discovering powerful forces here which oppose any alteration of the patient's condition; they must be the same ones which in the past brought this condition about. During the construction of his symptoms something must have taken place which we can now reconstruct from our experiences during the *resolution* of his symptoms. We already know from Breuer's observation that there is a precondition for the existence of a symptom: some mental process must not have been [294]
brought to an end normally – so that it could become conscious. The symptom is a substitute for what did not happen at that point [p. 247 above]. We now know the point at which we must locate the operation of the force which we have surmised. A violent opposition must have

started against the entry into consciousness of the questionable mental process, and for that reason it remained unconscious. As being something unconscious, it had the power to construct a symptom. This same opposition, during psychoanalytic treatment, sets itself up once more against our effort to transform what is unconscious into what is conscious. This is what we perceive as resistance. We have proposed to give the pathogenic process which is demonstrated by the resistance the name of *repression* [*Verdrängung*][T].

We must now form more definite ideas about this process of repression. It is the precondition for the construction of symptoms; but it is also something to which we know nothing similar. Let us take as our model an impulse [*Impuls*], a mental process that endeavours to turn itself into an action. We know that it can be repelled by what we term a rejection or condemnation. When this happens, the energy at its disposal is withdrawn from it; it becomes powerless, though it can persist as a memory. The whole process of coming to a decision about it runs its course within the knowledge of the ego. It is a very different matter if we suppose that the same impulse is subjected to repression. In that case it would retain its energy and no memory of it would remain behind; moreover, the process of repression would be accomplished unnoticed by the ego. This comparison, therefore, brings us no nearer to the essential nature of repression.

I will put before you the only theoretical ideas which have proved of service for giving a more definite shape to the concept of repression. It is above all essential for this purpose that we should proceed from the purely descriptive meaning of the word 'unconscious' to the systematic meaning of the same word.[1] That is, we will decide to say that the fact of
[295] a psychical process being conscious or unconscious is only one of its attributes and not necessarily an unambiguous one. If a process of this kind has remained unconscious, its being kept away from consciousness may perhaps only be an indication of some vicissitude [*Schicksals*][T] it has gone through, and not that vicissitude itself. In order to form a picture of this vicissitude, let us assume that every mental process – we must admit one exception, which we shall mention at a later stage[2] – exists to begin with in an unconscious stage or phase and that it is only from there that the process passes over into the conscious phase, just as a photographic

1 [See Vol. 15, footnote 2, p. 198 above. The spatial analogy to resistance and repression, which follows here, is similar to the one in the second of his *Five Lectures* (1910*a*), *RSE*, **11**, 25–7.]

2 [The exception, as mentioned on p. 361 f. below, is affect.]

picture begins as a negative and only becomes a picture after being turned into a positive. Not every negative, however, necessarily becomes a positive; nor is it necessary that every unconscious mental process should turn into a conscious one. This may be advantageously expressed by saying that an individual process belongs to begin with to the system of the unconscious and can then, in certain circumstances, pass over into the system of the conscious.

The crudest idea of these systems is the most convenient for us – a spatial one. Let us therefore compare the system of the unconscious to a large entrance hall, in which the mental impulses [*Seelenregungen*] jostle one another like separate individuals. Adjoining this entrance hall there is a second, narrower, room – a kind of drawing room – in which consciousness, too, resides. But on the threshold between these two rooms a watchman performs his function: he examines the different mental impulses, acts as a censor, and will not admit them into the drawing room if they displease him. You will see at once that it does not make much difference if the watchman turns away a particular impulse at the threshold itself or if he pushes it back across the threshold after it has entered the drawing room. This is merely a question of the degree of his watchfulness and of how early he carries out his act of recognition. If we keep to this picture, we shall be able to extend our nomenclature further. The impulses in the entrance hall of the unconscious are out of sight of the conscious, which is in the other room; to begin with they must remain unconscious. If they have already pushed their way forward to the threshold and have been turned back by the watchman, then they are inadmissible to consciousness;[1] we speak of [296]
them as *repressed*. But even the impulses which the watchman has allowed to cross the threshold are not on that account necessarily conscious as well; they can only become so if they succeed in catching the eye of consciousness. We are therefore justified in calling this second room the system of the *preconscious*. In that case becoming conscious retains its purely descriptive sense. For any particular impulse, however, the vicissitude of repression consists in its not being allowed by the watchman to pass from the system of the unconscious into that of the preconscious. It is the same watchman whom we get to know as resistance when we try to lift the repression by means of the analytic treatment.

1 ['*Bewusstseinsunfähig*.' The term is due to Breuer, who constructed it on the model of '*Hoffähig*' ('admissible to court', 'having the *entrée*'). See Section 5 of his contribution to *Studies on Hysteria* (1895*d*), *RSE*, **2,** 200 *n*.]

Now I know you will say that these ideas are both crude and fantastic and quite impermissible in a scientific account. I know that they are crude: and, more than that, I know that they are incorrect, and, if I am not very much mistaken, I already have something better to take their place.[1] Whether it will seem to you equally fantastic I cannot tell. They are preliminary working hypotheses, like Ampère's manikin swimming in the electric current,[2] and they are not to be despised insofar as they are of service in making our observations intelligible. I should like to assure you that these crude hypotheses of the two rooms, the watchman at the threshold between them and consciousness as a spectator at the end of the second room must nevertheless be very far-reaching approximations to the real facts. And I should like to hear you admit that our terms, 'unconscious', 'preconscious' and 'conscious', prejudge things far less and are far easier to justify than others which have been proposed or are in use, such as 'subconscious', 'paraconscious', 'intraconscious' and the like.[3]

[297] It will therefore be of greater importance to me if you warn me that an arrangement of the mental apparatus, such as I have here assumed in order to explain neurotic symptoms, must necessarily claim general validity and must give us information about normal functioning as well. You will, of course, be quite right in this. At the moment we cannot pursue this implication further; but our interest in the psychology of the forming of symptoms cannot but be increased to an extraordinary extent if there is a prospect, through the study of pathological conditions, of obtaining access to the normal mental events which are so well concealed.

Perhaps you recognize, moreover, what it is that supports our hypotheses of the two systems, and their relation to each other and to consciousness? After all, the watchman between the unconscious and the preconscious is nothing else than the *censorship* [*Zensur*], to which, as we found, the form taken by the manifest dream is subject. [Cf. Lecture IX, Vol. 15, p. 122 above.] The day's residues, which we recognized as the instigators of the dream, were preconscious material which, at night-time and in the state of sleep, had been under the influence of

1 [What Freud had in mind is not obvious.]

2 [A.-M. Ampère (1775–1836), one of the founders of the science of electromagnetism, made use of a magnetic metal manikin in one of his early experiments establishing the relation between electricity and magnetism.]

3 [Freud gives an explanation of his objection to the term 'subconscious' near the end of Chapter II of his work on lay analysis (1926*e*), *RSE*, **20**, 176. See also an Editors' footnote to Section I of 'The Unconscious' (1915*e*), ibid., **14**, 151 *n.* 1.]

unconscious and repressed wishful impulses [*Wunschregungen*]; they had been able, in combination with those impulses and thanks to their energy, to construct the latent dream. Under the dominance of the unconscious system this material had been worked over (by condensation and displacement) in a manner which is unknown or only exceptionally permissible in normal mental life – that is, in the preconscious system. We came to regard this difference in their manner of operating as what characterizes the two systems; the relation which the preconscious has to consciousness was regarded by us merely as an indication of its belonging to one of the two systems.[1] Dreams are not pathological phenomena; they can appear in any healthy person under the conditions of a state of sleep. Our hypothesis about the structure of the mental apparatus, which allows us to understand the formation alike of dreams and of neurotic symptoms, has an incontrovertible claim to [298]
being taken into account in regard to normal mental life as well.

That much is what we have to say for the moment about repression. But it is only the *precondition* for the construction of symptoms. Symptoms, as we know, are a substitute for something that is held back by repression. It is a long step further, however, from repression to an understanding of this substitutive structure. On this other side of the problem, these questions arise out of our observation of repression: what kinds of mental impulses are subject to repression? by what forces [*Kräften*][T] is it accomplished? and for what motives? So far we have only one piece of information on these points. In investigating resistance we have learnt that it emanates from forces of the ego, from known and latent character traits [p. 257 above]. It is these too, therefore, that are responsible for repression, or at any rate they have a share in it. We know nothing more at present.

At this point the second of the two observations which I mentioned to you earlier [at the opening of this lecture] comes to our help. It is quite generally the case that analysis allows us to arrive at the intention of neurotic symptoms. This again will be nothing new to you. I have already demonstrated it to you in two cases of neurosis.[2] But, after all, what do two cases amount to? You are right to insist on its being demonstrated to you in two hundred cases – in countless cases. The only trouble is that I cannot do that. Once again, your own experience must

1 [Cf. the discussions at the end of Lectures XIII and XIV, Vol. 15, pp. 184 and 198 above.]

2 [In Lecture XVII, p. 230 ff. above.]

serve instead, or your belief, which on this point can appeal to the unanimous reports of all psychoanalysts.

You will recollect that, in the two cases whose symptoms we submitted to a detailed investigation, the analysis initiated us into these patients' most intimate sexual life. In the first case we further recognized with particular clarity the intention or purpose of the symptom we were examining; in the second case this was perhaps somewhat concealed by a factor which will be mentioned later [p. 265 below]. Well, every other case that we submit to analysis would show us the same thing that we have found in these two examples. In every instance we should be introduced by the analysis into the patients' sexual experiences and
[299] wishes; and in every instance we should be bound to see that the symptoms served the same intention. We find that this intention is the satisfaction of sexual wishes; the symptoms serve for the patients' sexual satisfaction; they are a substitute for satisfaction of this kind, which the patients are without in their lives.

Think of our first patient's obsessional action. The woman was without her husband, whom she loved intensely but with whom she could not share her life on account of his deficiencies and weaknesses. She had to remain faithful to him; she could not put anyone else in his place. Her obsessional symptom gave her what she longed for, set her husband on a pedestal, denied [*verleugnet*] and corrected his weaknesses and above all his impotence. This symptom was fundamentally a wish fulfilment, just like a dream – and moreover, what is not always true of a dream, an *erotic* wish fulfilment. In the case of our second patient you could at least gather that her ceremonial sought to obstruct intercourse between her parents or prevent it from producing a new baby. You will also probably have guessed that it was at bottom endeavouring to put her herself in her mother's place. Once again, therefore, a setting aside of interferences with sexual satisfaction and a fulfilment of the patient's own sexual wishes. I shall soon come to the complication I have hinted at.

I should like to anticipate, gentlemen, the qualifications which I shall have to make later in the universal validity of these statements. I will therefore point out to you that all I have said here about repression and the formation and meaning of symptoms was derived from three forms of neurosis – anxiety hysteria, conversion hysteria and obsessional neurosis – and that in the first instance it is also valid only for these forms. These three disorders, which we are accustomed to group together as '*transference neuroses*',[1] also circumscribe the region in which

1 [The explanation of this term is given in a later lecture, p. 393 below.]

psychoanalytic therapy can function. The other neuroses have been far less thoroughly studied by psychoanalysis; in one group of them the impossibility of therapeutic influence has been a reason for this neglect. Nor should you forget that psychoanalysis is still a very young science, that preparing for it costs much trouble and time, and that not at all long ago it was being practised single-handed. Nevertheless, we are everywhere on the point of penetrating to an understanding of these other disorders which are not transference neuroses. I hope later to be able to introduce you to the extensions of our hypotheses and findings which result from adaptation to this new material, and to show you that these further studies have not led to contradictions but to the establishment of higher unities.[1] If, then, everything I am saying here applies to the transference neuroses, let me first increase the value of symptoms by a new piece of information. For a comparative study of the determining causes of falling ill leads to a result which can be expressed in a formula: these people fall ill in one way or another of *frustration* [*Versagung*][T], when reality prevents them from satisfying their sexual wishes.[2] You see how excellently these two findings tally with each other. It is only thus that symptoms can be properly viewed as substitutive satisfactions for what is missed in life. [300]

No doubt all kinds of objections can still be raised to the assertion that neurotic symptoms are substitutes for sexual satisfactions. I will mention two of them today. When you yourselves have carried out analytic examinations of a considerable number of neurotics, you will perhaps tell me, shaking your head, that in a lot of cases my assertion is simply not true; the symptoms seem rather to have the contrary purpose of excluding or of stopping sexual satisfaction. I will not dispute the correctness of your interpretation. The facts in psychoanalysis have a habit of being rather more complicated than we like. If they were as simple as all that, perhaps it might not have needed psychoanalysis to bring them to light. Indeed, some of the features of our second patient's ceremonial show signs of this ascetic character with its hostility to sexual satisfaction: when, for instance, she got rid of the clocks and watches [p. 234 above], which had the magical meaning of avoiding erections during the night [p. 235 f.], or when she tried to guard against flower pots falling and breaking [p. 234], which was equivalent to protecting her virginity [p. 236]. In some other cases of bed ceremonials, which I have been able to analyse, this negative character was far more outspoken; the

1 [See the discussion of narcissism in Lecture XXVI, p. 364 ff. below.]

2 [This is discussed in greater detail in Lecture XXII, p. 303 ff. below.]

[301] ceremonial might consist exclusively of defensive measures against sexual memories and temptations. However, we have already found often enough that in psychoanalysis opposites imply no contradiction.[1] We might extend our thesis and say that symptoms aim either at a sexual satisfaction or at fending it off, and that on the whole the positive, wish-fulfilling character prevails in hysteria and the negative, ascetic one in obsessional neurosis. If symptoms can serve the purpose both of sexual satisfaction and of its opposite, there is an excellent basis for this double-sidedness or polarity in a part of their mechanism which I have so far not been able to mention. For, as we shall hear, they are the products of a compromise and arise from the mutual interference between two opposing currents; they represent not only the repressed but also the repressing force which had a share in their origin. One side or the other may be more strongly represented; but it is rarely that one influence is entirely absent. In hysteria a convergence of both intentions in the same symptom is usually achieved. In obsessional neurosis the two portions are often separated; the symptom then becomes diphasic [falls into two stages] and consists in two actions, one after the other, which cancel each other out.[2]

We shall not be able to dismiss a second objection so easily. If you survey a fairly long series of interpretations of symptoms, you will probably start by judging that the concept of a substitutive sexual satisfaction has been stretched to its extreme limits in them. You will not fail to emphasize the fact that these symptoms offer nothing real in the way of satisfaction, that often enough they are restricted to the revival of a sensation or the representation of a phantasy derived from a sexual complex. And you will further point out that these supposed sexual satisfactions often take on a childish and discreditable form, approximate to an act of masturbation perhaps, or recall dirty kinds of naughtiness which are forbidden even to children – habits of which they have been broken. And, going on from this, you will also express surprise that we are representing as a sexual satisfaction what would rather have to be
[302] described as the satisfaction of lusts that are cruel or horrible or would even have to be called unnatural. We shall come to no agreement, gentlemen, on this latter point till we have made a thorough investigation of the sexual life of human beings and till, in doing so, we have decided what it is that we are justified in calling 'sexual'.

1 [E.g. in Lecture XI, Vol. 15, p. 155 above.]

2 [Examples of this can be found, with a discussion, in Section E of Part I of the 'Rat Man' case history (1909*d*), *RSE*, **10**, 146–7 and footnote 2.]

LECTURE XX

THE SEXUAL LIFE OF HUMAN BEINGS[1]

Ladies and Gentlemen, one would certainly have supposed that there could be no doubt as to what is to be understood by 'sexual' [*Sexuellen*][T]. First and foremost, what is sexual is something improper, something one ought not to talk about. I have been told that the pupils of a celebrated psychiatrist made an attempt once to convince their teacher of how frequently the symptoms of hysterical patients represent sexual things. For this purpose they took him to the bedside of a female hysteric, whose attacks were an unmistakable imitation of the process of childbirth. But with a shake of his head he remarked: 'Well, there's nothing sexual about childbirth.' Quite right. Childbirth need not in every case be something improper. [303] *Sex*

I see that you take offence at my joking about such serious things. But it is not altogether a joke. Seriously, it is not easy to decide what is covered by the concept 'sexual'. Perhaps the only suitable definition would be 'everything that is related to the distinction between the two sexes'. But you will regard that as colourless and too comprehensive. If you take the fact of the sexual act as the central point, you will perhaps define as sexual everything which, with a view to obtaining pleasure, is concerned with the body, and in particular with the sexual organs, of someone of the opposite sex, and which in the last resort aims at the union of the genitals and the performance of the sexual act. But if so you will really not be very far from the equation of what is sexual with what is improper, and childbirth will really not be anything sexual. If, on the other hand, you take the reproductive function as the nucleus of sexuality, you risk excluding a whole number of things which are not aimed at reproduction but which are certainly sexual, such as masturbation and perhaps even kissing. But we are already prepared to find that attempts [304]

1 [Freud's principal work on this subject was, of course, his *Three Essays on the Theory of Sexuality* (1905*d*), to which he made a large number of additions and corrections in a succession of editions over the subsequent twenty years. A list of his chief other contributions to the subject is given in an Appendix to the work in *RSE*, 7, 216–17. The material in this and the following lecture is mainly derived from the *Three Essays*.]

at a definition always lead to difficulties; so let us renounce the idea of doing better in this particular case. We may suspect that in the course of the development of the concept 'sexual' something has happened which has resulted in what Silberer has aptly called an 'error of superimposition'.[1]

On the whole, indeed, when we come to think of it, we are not quite at a loss in regard to what it is that people call sexual. Something which combines a reference to the contrast between the sexes, to the search for pleasure, to the reproductive function and to the characteristic of something that is improper and must be kept secret – some such combination will serve for all practical purposes in everyday life. But for science that is not enough. By means of careful investigations (only made possible, indeed, by disinterested self-discipline) we have come to know groups of individuals whose 'sexual life' deviates in the most striking way from the usual picture of the average. Some of these 'perverse' people have, we might say, struck the distinction between the sexes off their programme. Only members of their own sex can rouse [*erregen*] their sexual wishes; those of the other sex, and especially their sexual parts, are not a sexual object for them at all, and in extreme cases are an object of disgust. This implies, of course, that they have abandoned any share in reproduction. We call such people homosexuals or inverts. They are men and women who are often, though not always, irreproachably fashioned in other respects, of high intellectual and ethical development, the victims only of this one fatal deviation. Through the mouth of their scientific spokesmen they represent themselves as a special variety of the human species – a 'third sex' which has a right to stand on an equal footing beside the other two. We shall perhaps have an opportunity of examining their claims critically. [Cf. p. 271 below.] Of course they are not, as they also like to
[305] assert, an 'élite' of mankind; there are at least as many inferior and useless individuals among them as there are among those of a different sexual kind.

This class of perverts at any rate behave to their sexual objects in approximately the same way as normal people do to theirs. But we now come to a long series of abnormal people whose sexual activity diverges more and more widely from what seems desirable to a sensible person. In their multiplicity and strangeness they can only be compared to the

1 ['*Überdeckungsfehler*.' See Silberer, 1914, 161. What Silberer seemed to have in mind was mistakenly thinking that you are looking at a single thing, when in fact you are looking at two different things superimposed on each other.]

grotesque monsters painted by Breughel for the temptation of St Anthony or to the long procession of vanished gods and believers which Flaubert leads past, before the eyes of his pious penitent.[1] Such a medley calls for some kind of arrangement if it is not to confuse our senses. We accordingly divide them into those in whom, like the homosexuals, the sexual *object* has been changed, and others in whom the sexual *aim* is what has primarily been altered. The first group includes those who have renounced the union of the two genitals and who replace the genitals of one of the couple engaged in the sexual act with some other part or region of the body; in this they disregard the lack of suitable organic arrangements as well as any impediment offered by feelings of disgust. (They replace the vulva [*Scheide*][t], for instance, with the mouth or anus.) Others follow, who, it is true, still retain the genitals as an object – not, however, on account of their sexual function but of other functions in which the genital plays a part either for anatomical reasons or because of its propinquity. We find from them that the excretory functions, which have been put aside as improper during the upbringing of children, retain the ability to attract the whole of sexual interest. Then come others again, who have abandoned the genital as an object altogether, and have taken some other part of the body as the object they desire – a woman's breast, a foot or a plait of hair. After them come others for whom parts of the body are of no importance but whose every wish is satisfied by a piece of clothing, a shoe, a piece of underclothing – the fetishists. Later in the procession come people who require the whole object indeed, but make quite definite demands of it – strange or horrible – even that it must have become a defenceless corpse, and who, [306] using criminal violence [*Zwang*], make it into one so that they may enjoy it. But enough of this kind of horror!

The second group is led by perverts who have made what is normally only an introductory or preparatory act into the aim of their sexual wishes. They are people whose desire it is to look at the other person or to feel him or to watch him in the performance of his intimate actions, or who expose parts of their own bodies which should be covered, in the obscure expectation that they may be rewarded by a corresponding action in return. Next come the sadists, puzzling people whose tender endeavours have no other aim than to cause pain and torment to their object, ranging from humiliation to severe physical injuries; and, as though to counterbalance them, their counterparts, the masochists, whose only pleasure it is to suffer humiliations and torments of every

1 [Flaubert's *La tentation de Saint Antoine*, Part V of the final version (1874).]

kind from their loved object either symbolically or in reality. There are still others in whom several of these abnormal preconditions are united and intertwined; and lastly, we must learn that each of these groups is to be found in two forms: alongside of those who seek their sexual satisfaction in reality are those who are content merely to *imagine* that satisfaction, who need no real object at all, but can replace it with their phantasies.

Now there cannot be the slightest doubt that all these crazy, eccentric and horrible things really constitute the sexual activity of these people. Not only do they themselves regard them as such and are aware that they are substitutes for each other, but we must admit that they play the same part in their lives as normal sexual satisfaction does in ours; they make the same, often excessive sacrifices for them, and we can trace both in the rough and in finer detail the points at which these abnormalities are based on [*anlehnen*] what is normal and the points at which they diverge from it. Nor can you fail to notice that here once again you find the characteristic of being improper, which clings to sexual activity, though here it is for the most part intensified to the point of being abominable.

Well, ladies and gentlemen, what attitude are we to adopt to these unusual kinds of sexual satisfaction? Indignation, an expression of our personal repugnance and an assurance that we ourselves do not share
[307] these lusts will obviously be of no help. Indeed, that is not what we have been asked for. When all is said and done, what we have here is a field of phenomena like any other. A denial in the form of an evasive suggestion that after all these are only rarities and curiosities would be easy to refute. On the contrary, we are dealing with quite common and widespread phenomena. If, however, it is argued that we need not allow our views of sexual life to be misled by them because they are one and all aberrations and deviations of the sexual drive, a serious answer is called for. Unless we can understand these pathological forms of sexuality and can coordinate them with normal sexual life, we cannot understand normal sexuality either. In short, it remains an unavoidable task to give a complete theoretical account of how it is that these perversions can occur and of their connection with what is described as normal sexuality.

We shall be helped in this by a piece of information and two fresh observations. We owe the former to Iwan Bloch [1902–3]. It corrects the view that all these perversions are 'signs of degeneracy' by showing that aberrations of this kind from the sexual aim, loosenings like these of the

tie with the sexual object, have occurred from time immemorial, in all periods known to us, among all peoples, the most primitive and the most civilized, and have occasionally obtained toleration and general recognition. The two observations were derived from the psychoanalytic investigation of neurotics; they are bound to have a decisive influence on our view of the sexual perversions.

I have said that neurotic symptoms are substitutes for sexual satisfaction [p. 264 above], and I indicated to you that the confirmation of this assertion by the analysis of symptoms would come up against a number of difficulties. For it can only be justified if under 'sexual satisfaction' we include the satisfaction of what are called perverse sexual needs, since an interpretation of symptoms of that kind is forced upon us with surprising frequency. The claim made by homosexuals or inverts to being exceptions collapses at once when we learn that homosexual impulses are invariably discovered in every single neurotic, and that a fair number of symptoms give expression to this latent inversion. Those who call themselves homosexuals are only the conscious and manifest inverts, whose number is nothing compared to that of the *latent* homosexuals. [308]
We are compelled, however, to regard choice of an object of one's own sex as a divergence in erotic life which is of positively habitual occurrence, and we are learning more and more to ascribe an especially high importance to it. No doubt this does not do away with the differences between manifest homosexuality and a normal attitude; their practical significance remains, but their theoretical value is greatly diminished. We have even found that a particular disease, paranoia, which is not to be counted among the transference neuroses, regularly arises from an attempt to fend off [*Abwehr*] excessively strong homosexual impulses.[1] You will perhaps recall that one of our patients (p. 231) behaved in her obsessional action like a man, her own husband whom she had left; neurotic women very commonly produce symptoms in this way in the character of a man. Even if this is not actually to be regarded as homosexuality, it is closely related to its preconditions.

As you probably know, the hysterical neurosis can produce its symptoms in any system of organs and so disturb any function. Analysis shows that in this way all the so-called perverse impulses which seek to replace the genital with some other organ manifest themselves: these organs are then behaving like substitutive genitals. The symptoms of hysteria have actually led us to the view that the bodily organs, besides the functional

1 [Paranoia is further discussed in Lecture XXVI, p. 374 ff. below.]

part they play, must be recognized as having a sexual (erotogenic) significance, and that the execution of the first of these tasks is disturbed if the second of them makes too many claims.[1] Countless sensations and innervations which we come across as symptoms of hysteria in organs that have no apparent connection with sexuality are in this way revealed to us as being in the nature of fulfilments of perverse sexual impulses in relation to which other organs have acquired the significance of the sexual parts. We learn too to what a large extent the organs for the intake of nourishment and for excretion can in particular become the vehicles of sexual excitation. Here, then, we have the same thing that we were shown by the perversions; only in their case it was visible easily and
[309] unmistakably, whereas in hysteria we have to take a circuitous path by way of the interpretation of symptoms, and do not then ascribe the perverse sexual impulses concerned to the subject's consciousness but locate them in his unconscious.

Of the many symptomatic pictures in which obsessional neurosis appears, the most important turn out to be those provoked by the pressure of excessively strong sadistic sexual impulses (perverse, therefore, in their aim). The symptoms, indeed, in accordance with the structure of an obsessional neurosis, serve predominantly as a *defence* [*Abwehr*] against these wishes or give expression to the struggle between satisfaction and defence. But satisfaction does not come off too badly either; it succeeds in roundabout ways in putting itself into effect in the patients' behaviour and is preferably directed against themselves and makes them into self-tormentors. Other forms of the neurosis, the brooding kinds, correspond to an excessive sexualization of actions which ordinarily have their place as preliminaries on the path to normal sexual satisfaction – an excessive sexualization of wanting to look or to touch or to explore. Here we have the explanation of the great importance of the fear of touching and of the obsession for washing [*Waschzwanges*]. An unsuspectedly large proportion of obsessional actions may be traced back to masturbation, of which they are disguised repetitions and modifications;[2] it is a familiar fact that masturbation, though a single and uniform action, accompanies the most various forms of sexual phantasying.

I should not have much difficulty in giving you a far more intimate picture of the relations between perversion and neurosis; but I think

1 [This point is discussed at greater length in a paper on psychogenic disturbance of vision (1910*i*), *RSE*, **11**, 205 ff.]

2 [The mechanism of the development of obsessional actions is described in detail in the paper on obsessions and religion (1907*b*), ibid., **9**, 101 ff.]

what I have already said will serve our purpose. We must, however, guard against being misled by what I have told you of the meaning of symptoms into overestimating the frequency and intensity of people's perverse inclinations. It is possible, as you have heard [p. 265 above], to fall ill of a neurosis as a result of a frustration of normal sexual satisfaction. But when a real frustration like this occurs, the need moves over on to abnormal methods of sexual excitation. You will later learn the way in which this happens [p. 304 ff. below]. But in any case you will realize that [310] as a result of this 'collateral' damming back [of the normal sexual current] the perverse impulses must emerge more strongly than they would have if normal sexual satisfaction had met with no obstacle in the real world.[1] Moreover a similar influence is to be recognized also as affecting the *manifest* perversions. In some cases they are provoked or made active if the normal satisfaction of the sexual drive encounters too great difficulties for temporary reasons or because of permanent social regulations.[2] In other cases, it is true, the inclination to perversions is quite independent of such favouring conditions; they are, we might say, the normal species of sexual life for those particular individuals.

For the moment, perhaps, you may have an impression that I have confused rather than explained the relation between normal and perverse sexuality. But you must bear the following consideration in mind. If it is true that increased difficulty in obtaining normal sexual satisfaction in real life, or deprivation of that satisfaction, brings out perverse inclinations in people who had not shown any previously, we must suppose that there was something in these people which came halfway to meet the perversions; or, if you prefer it, the perversions must have been present in them in a latent form.

And this brings us to the second novelty that I announced to you [p. 270 f. above].[3] For psychoanalytic research has had to concern itself, too, with the sexual life of children, and this is because the memories and associations arising during the analysis of symptoms [in adults] regularly led back to the early years of childhood. What we inferred from these analyses was later confirmed point by point by direct observations of

1 [This analogy of a collateral flow through intercommunicating channels is more clearly explained in Section 6 of the first of Freud's *Three Essays* (1905*d*), *RSE*, **7**, 151 f. Cf. also below, p. 304.]

2 [This last point is discussed at length in Freud's paper on '"Civilized" Sexual Morality and Modern Nervous Illness' (1908*d*), *RSE*, **9**, especially 174–5.]

3 [The first was the important part played in the neuroses by perverse sexuality. What follows was touched on more briefly in Lecture XIII, Vol. 15, p. 181 ff. above.]

[311] children.[1] And it then turned out that all these inclinations to perversion had their roots in childhood, that children have a predisposition to all of them and carry them out to an extent corresponding to their immaturity – in short, that perverse sexuality is nothing else than a magnified infantile sexuality split up into its separate impulses.

At all events you will now see the perversions in a new light and no longer fail to realize their connection with the sexual life of human beings: but at the price of what surprises and of what feelings of distress over these incongruities! No doubt you will feel inclined at first to deny the whole business: the fact that children have anything that can be described as sexual life, the correctness of our observations and the justification for finding any kinship between the behaviour of children and what is later condemned as perversion. So allow me to begin by explaining to you the motives for your opposition, and then to present you with the sum of our observations. To suppose that children have no sexual life – sexual excitations and needs and a kind of satisfaction – but suddenly acquire it between the ages of twelve and fourteen, would (quite apart from any observations) be as improbable, and indeed senseless, biologically as to suppose that they brought no genitals with them into the world and only grew them at the time of puberty. What *does* awaken in them at this time is the reproductive function, which makes use for its purposes of physical and mental material already present. You are committing the error of confusing sexuality and reproduction and by doing so you are blocking your path to an understanding of sexuality, the perversions and the neuroses. This error is, however, a tendentious one. Strangely enough, it has its source in the fact that you yourselves were once children and, while you were children, came under the influence of education [*Erziehung*][T]. For society must undertake as one of its most important educative tasks to tame and restrict the sexual drive when it breaks out as an urge to reproduction, and to subject it to an individual will which is identical to the bidding of society. It is also concerned to postpone the full development of the drive till the child shall have reached a certain degree of intellectual maturity, for, with the complete irruption of the sexual drive, educability is for practical
[312] purposes at an end. Otherwise, the drive would break down every dam and wash away the laboriously erected work of civilization. Nor is the task of taming it ever an easy one; its success is sometimes too small, sometimes too great. The motive of human society is in the last resort an

1 [The earliest of these direct observations were made in the case of 'Little Hans' (1909*b*), *RSE*, **10**, 5 ff.]

economic one; since it does not possess enough provisions to keep its members alive unless they work, it must restrict the number of its members and divert their energies from sexual activity to work. It is faced, in short, with the eternal, primaeval exigencies of life, which are with us to this day.[1]

Experience must no doubt have taught the educators that the task of making the sexual will of the new generation tractable could only be carried out if they began to exercise their influence very early, if they did not wait for the storm of puberty but intervened already in the sexual life of children which is preparatory to it. For this reason almost all infantile sexual activities were forbidden to children and frowned upon; an ideal was set up of making the life of children asexual, and in course of time things came to the point at which people really believed they were asexual and thereafter science pronounced this as its doctrine. To avoid contradicting their belief and their intentions, people since then overlook the sexual activities of children (no mean achievement) or are content in science to take a different view of them. Children are pure and innocent, and anyone who describes them otherwise can be charged with being an infamous blasphemer against the tender and sacred feelings of mankind.

Children are alone in not falling in with these conventions. They assert their animal rights with complete naivety and give constant evidence that they have still to travel the road to purity. Strangely enough, the people who deny the existence of sexuality in children do not on that account become milder in their educational efforts but pursue the manifestations of what they deny exists with the utmost severity – describing them as 'childish naughtinesses'. It is also of the highest theoretical interest that the period of life which contradicts the prejudice of an asexual childhood most glaringly – the years of a child's life up to the age of five or six – is afterwards covered in most people by the veil of amnesia which is only completely torn away by an analytic enquiry, though it has been permeable earlier for the construction of a few dreams. [Cf. Vol. 15, p. 174 f. above.] [313]

I will now set out before you what is most definitely known about the sexual life of children. Let me at the same time, for convenience sake, introduce the concept of 'libido'. On the exact analogy of 'hunger', we use 'libido' as the name of the force (in this case that of the sexual drive, as in the case of hunger that of the nutritive drive) by which the drive

1 [See Vol. 15, p. 21 f. above.]

manifests itself. Other concepts, such as sexual 'excitation' and 'satisfaction', call for no explanation. You yourselves will easily perceive that the sexual activities of infants in arms are mostly a matter of interpretation, or you will probably use that as a ground of objection. These interpretations are arrived at on the basis of analytic examinations made by tracing from the symptoms backwards. In an infant the first impulses of sexuality make their appearance attached to [*in Anlehnung an*][T] other vital functions. His main interest is, as you know, directed to the intake of nourishment; when children fall asleep after being sated at the breast, they show an expression of blissful satisfaction which will be repeated later in life after the experience of a sexual orgasm. This would be too little on which to base an inference. But we observe how an infant will repeat the action of taking in nourishment without making a demand for further food; here, then, he is not actuated by hunger. We describe this as sensual sucking,[1] and the fact that in doing this he falls asleep once more with a blissful expression shows us that the act of sensual sucking has in itself alone brought him satisfaction. Soon, as we know, things come to a point at which he cannot go to sleep without having sucked. A paediatrician in Budapest, Dr Lindner [1879], was the first to point out long ago the sexual nature of this activity. Those who are in charge of children, and who have no theoretical views on the subject, seem to form a similar judgement of sucking. They have no doubt of its only purpose being to obtain pleasure, class it as one of a child's 'naughtinesses' and compel him to abandon it by causing him distress, if he will not give it up of his own accord. Thus we learn that infants perform actions which have no purpose other than obtaining pleasure. It is our belief that they first experience this pleasure in connection with taking nourishment but that they soon learn to separate it from that accompanying condition. We can only refer this pleasure to an excitation of the areas of the mouth and lips; we call those parts of the body 'erotogenic zones' and describe the pleasure derived from sucking as a sexual one. We shall no doubt have to discuss further whether this description is justifiable.

Anlehnung

[314]

If an infant could speak, he would no doubt pronounce the act of sucking at his mother's breast by far the most important in his life. He is not far wrong in this, for in this single act he is satisfying at once the two great vital needs. We are therefore not surprised to learn from psychoanalysis how much psychical importance the act retains all through life. Sucking at the mother's breast is the starting point of the whole of sexual life, the

1 [The German nursery terms here used are '*lutschen*' or '*ludeln*', for which there is no obvious English equivalent.]

unmatched prototype of every later sexual satisfaction, to which phantasy often enough recurs in times of need. This sucking involves making the mother's breast the first object of the sexual drive. I can give you no idea of the important bearing of this first object upon the choice of every later object, of the profound effects it has in its transformations and substitutions in even the remotest regions of our sexual life. But at first the infant, in his sucking activity, gives up this object and replaces it with a part of his own body. He begins to suck his thumbs or his own tongue. In this way he makes himself independent of the consent of the external world as regards gaining pleasure, and besides this he increases it by adding the excitation of a second area of his body. The erotogenic zones are not all equally generous in yielding pleasure; it is therefore an important experience when the infant, as Lindner reports, discovers, in the course of feeling around, the specially excitable regions afforded by his genitals and so finds his way from sucking to masturbation.

In forming this opinion of sensual sucking we have already become acquainted with two decisive characteristics of infantile sexuality. It makes its appearance attached to [*in Anlehnung an*] the satisfaction of the major organic needs, and it behaves *auto-erotically* – that is, it seeks and finds its objects in the infant's own body. What has been shown most clearly in connection with the intake of nourishment is repeated in part with the excretions. We conclude that infants have feelings of pleasure in [315]
the process of evacuating urine and faeces and that they soon contrive to arrange those actions in such a way as to bring them the greatest possible yield of pleasure through the corresponding excitations of the erotogenic zones of the mucous membrane. It is here for the first time (as Lou Andreas-Salomé [1916] has subtly perceived) that they encounter the external world as an inhibiting power, hostile to their desire for pleasure, and have a glimpse of later conflicts both external and internal. An infant must not produce his excreta at whatever moment he chooses, but when other people decide that he shall. In order to induce him to forgo these sources of pleasure, he is told that everything that has to do with these functions is improper and must be kept secret. This is where he is first obliged to exchange pleasure for social respectability. To begin with, his attitude to his excreta themselves is quite different. He feels no disgust at his faeces, values them as a portion of his own body with which he will not readily part, and makes use of them as his first 'gift', to distinguish people whom he values especially highly. Even after education has succeeded in its aim of making these inclinations alien to him, he carries on his high valuation of faeces in his estimate of 'gifts' and 'money'. On the

other hand, he seems to regard his achievements in urinating with peculiar pride.[1]

I know you have been wanting for a long time to interrupt me and exclaim: 'Enough of these atrocities! You tell us that defaecating is a source of sexual satisfaction, and already exploited in infancy! that faeces is a valuable substance and that the anus is a kind of genital! We don't believe all that – but we do understand why paediatricians and educationists have given a wide berth to psychoanalysis and its findings.' No, gentlemen. You have merely forgotten that I have been trying to introduce the facts of infantile sexual life to you in connection with the
[316] facts of the sexual perversions. Why should you not be aware that for a large number of adults, homosexual and heterosexual alike, the anus does really take over the role of the vagina in sexual intercourse? And that there are many people who retain a voluptuous feeling in defaecating all through their lives and describe it as being far from small? As regards interest in the act of defaecation and enjoyment in watching someone else defaecating, you can get children themselves to confirm the fact when they are a few years older and able to tell you about it. Of course, you must not have systematically intimidated them beforehand, or they will quite understand that they must be silent on the subject. And as to the other things that you are anxious not to believe, I will refer you to the findings of analysis and of the direct observation of children and will add that it calls for real ingenuity not to see all this or to see it differently. Nor do I complain if you find the kinship between infantile sexual activity and sexual perversions something very striking. But it is in fact self-evident: if a child has a sexual life at all it is bound to be of a perverse kind; for, except for a few obscure hints, children are without what makes sexuality into the reproductive function. On the other hand, the abandonment of the reproductive function is the common feature of all perversions. We actually describe a sexual activity as perverse if it has given up the aim of reproduction and pursues the attainment of pleasure as an aim independent of it. So, as you will see, the breach and turning point in the development of sexual life lies in its becoming subordinate to the purposes of reproduction. Everything that happens before this turn of events and equally everything that disregards it and that aims solely at obtaining pleasure is given the uncomplimentary name of 'perverse' and as such is proscribed.

1 [The relations between faeces and money were discussed by Freud in a paper on 'Character and Anal Erotism' (1908*b*), *RSE*, **9**, 149 ff., and in a later one, almost contemporary with the present lecture, 'On Transformations of Drive as Exemplified in Anal Erotism' (1916–17*e*), ibid., **17**, 115 ff. The connection between micturition and pride had been shown in a dream analysis in *I. of D.*, **5**, 419 f.]

Allow me, therefore, to proceed with my brief account of infantile sexuality. What I have already reported of two systems of organs [nutritional and excretory] might be confirmed in reference to the others. A child's sexual life is indeed made up entirely of the activities of a number of component drives which seek, independently of one another, to obtain pleasure, in part from the subject's own body and in part already from an external object. Among these organs the genitals come into prominence very soon. There are people in whom obtaining pleasure from their own genitals, without the assistance of any other genitals or of an [317]
object, continues uninterruptedly from infantile masturbation to the unavoidable masturbation[1] of puberty and persists for an indefinite length of time afterwards. Incidentally, the topic of masturbation is not one that can be so easily disposed of: it is something that calls for examination from many angles.[2]

Though I am anxious to cut short this discussion still further, I must nevertheless tell you a little about the sexual researches of children: they are too characteristic of infantile sexuality and of too great significance for the symptomatology of the neuroses to be passed over.[3] Infantile sexual researches begin very early, sometimes before the third year of life. They do not relate to the distinction between the sexes,[4] for this means nothing to children, since they (or at any rate boys) attribute the same male genital to both sexes. If, afterwards, a boy makes the discovery of the vagina from seeing his little sister or a girl playmate, he tries, to begin with, to disavow the evidence of his senses, for he cannot imagine a human creature like himself who is without such a precious portion. Later on, he takes fright at the possibility thus presented to him; and any threats that may have been made to him earlier, because he took too intense an interest in his little organ, now produce a deferred [*nachträglich*] effect. He comes under the sway of the castration complex,[5]

1 ['*Notonanie*', literally masturbation by necessity, i.e. forced on the subject by circumstances.]

2 [Freud's fullest remarks on the subject are in his 'Contributions to a Discussion on Masturbation' (1912*f*), *RSE*, **12**, 237 ff., where an Editors' Note gives further references.]

3 [See 'On the Sexual Theories of Children' (1908*c*), ibid., **9**, 183 ff.]

4 [This statement and the related one at the beginning of the next paragraph were corrected by Freud later, in a footnote to his paper on the anatomical distinction between the sexes (1925*j*), ibid., **19**, 253 *n*. 2. He there argues that the problem of sex distinction came first and that of the origin of babies afterwards, at any rate in girls.]

5 [This has already been mentioned above (Vol. 15, p. 181), and appears again below (p. 325 ff.). The first published discussions on the castration complex appeared in Freud's case history of 'Little Hans' (1909*b*), *RSE*, **10**, 5 ff., though it had been referred to in an earlier paper on the sexual theories of children (1908*c*), ibid., **9**, 189. Its relation to the Oedipus complex was fully examined in later years, more particularly in Freud's papers on 'The Dissolution of the Oedipus Complex' (1924*d*), ibid., **19**, 167 ff., and on the anatomical distinction between the sexes (1925*j*), ibid., **19**, 249 ff.]

[318] the form taken by which plays a great part in the construction of his character if he remains normal, in his neurosis if he falls ill, and in his resistances if he comes into analytic treatment. As regards little girls, we can say of them that they feel greatly at a disadvantage owing to their lack of a big, visible penis, that they envy boys for possessing one and that, in the main for this reason, they develop a wish to be a man – a wish that re-emerges later on, in any neurosis that may arise if they meet with a mishap in playing a feminine part. In her childhood, moreover, a girl's clitoris takes on the role of a penis entirely: it is characterized by special excitability and is the area in which auto-erotic satisfaction is obtained. The process of a girl's becoming a woman depends very much on the clitoris passing on this sensitivity to the vaginal orifice in good time and completely. In cases of what is known as sexual anaesthesia in women the clitoris has obstinately retained its sensitivity.

The sexual interest of children begins by turning, rather, to the problem of where babies come from[1] – the same problem which underlies the question put by the Theban Sphinx – and it is most often raised by egoistic fears on the arrival of a new baby. The reply which is ready to hand in the nursery, that babies are brought by the stork [Vol. 15, p. 140 above], comes up against disbelief on the part even of small children far oftener than we are aware. The sense of being defrauded of the truth by the grown-ups contributes much to making children feel lonely and to developing their independence. But a child is not in a position to solve this problem by his own means. His undeveloped sexual constitution sets definite limits to his power of perception. He begins by supposing that babies come from people taking in something special in their food, nor does he know that only women can have babies. Later he becomes aware of this limitation and ceases to regard eating as the origin of babies – though the theory persists in fairy tales. When the child has grown bigger, he soon notices that his father must play some part in getting babies, but he cannot guess what. If he happens to witness a sexual act, he regards it as an attempt at subjugation, a struggle, and this is the sadistic misunderstanding of coition. But at first he does not connect this act with the coming into being of a baby. So, too, if he finds traces of blood on his
[319] mother's bed or on her underclothes, he takes it as a sign that she has been injured by his father. Still later in childhood, he no doubt suspects that the man's sexual organ has an essential share in producing babies, but the only function he can attribute to that part of the body is micturition.

1 [See footnote 4, p. 279 above.]

From the very first, children are at one in thinking that babies must be born through the bowel; they must make their appearance like lumps of faeces. This theory is not abandoned until all anal interests have been deprived of their value, and it is then replaced by the hypothesis that the navel comes open or that the area of the breast between the nipples is where birth takes place. In this way the child in the course of his researches comes nearer to the facts about sex, or, feeling at a loss owing to his ignorance, he passes them by till, usually in the years before puberty, he is given what is as a rule a depreciatory and incomplete explanation, which often produces traumatic effects.

You will no doubt have heard, gentlemen, that in psychoanalysis the concept of what is sexual has been unduly extended in order to support the theses of the sexual causation of the neuroses and the sexual meaning of symptoms. You are now in a position to judge for yourselves whether this extension is unjustified. We have extended the concept of sexuality only far enough to be able to comprise the sexual life of perverts and of children. We have, that is to say, given it back its true compass. What is called sexuality outside psychoanalysis relates only to a restricted sexual life, which serves the purpose of reproduction and is described as normal.

LECTURE XXI

THE DEVELOPMENT OF THE LIBIDO AND THE SEXUAL ORGANIZATIONS

[320] Gentlemen, I am under the impression that I have not succeeded in bringing home to you quite convincingly the importance of the perversions for our view of sexuality, and I should therefore like so far as I can to improve and supplement what I have said.

It is not the case that the perversions alone would have obliged us to make the change in the concept of sexuality which has brought such violent contradictions down on us. The study of infantile sexuality had even more to do with it and it was the concurrence of the two which was decisive for us. But the manifestations of infantile sexuality, however unmistakable they may be in later childhood, seem to melt into indefiniteness towards their beginnings. Anyone who chooses to disregard the history of their development and their analytic context will deny that they are of a sexual character and will attribute some undifferentiated character to them instead. You must not forget that at the moment we are not in possession of any generally recognized criterion of the sexual nature of a process, apart, once again, from a connection with the reproductive function which we must reject as being too narrow-minded. The biological criteria, such as the periodicities of twenty-three and twenty-eight days postulated by Wilhelm Fliess [1906], are still highly debatable; the chemical characteristics of the sexual process, which we may suspect, are still awaiting discovery. On the other hand, the sexual perversions of adults are something tangible and unambiguous. As is already shown by the name by which they are universally known, they are unquestionably sexual. Whether they are described as indications of degeneracy or in any other way, no-one has yet had the courage to class them as anything but phenomena of sexual life. On their account alone we are justified in asserting that sexuality and reproduction do not coincide, for it is obvious that all of them disavow the aim of reproduction.

[321] I find a parallel here which is not uninteresting. Whereas for most people 'conscious' and 'psychical' are the same, we have been obliged to

extend the concept of 'psychical' and to recognize something 'psychical' that is not 'conscious'. And in just the same way, whereas other people declare that 'sexual' and 'connected with reproduction' (or, if you prefer to put it more briefly, 'genital') are identical, we cannot avoid postulating something 'sexual' that is not 'genital' – has nothing to do with reproduction. The similarity here is only a formal one, but it is not without a deeper foundation.

But if the existence of sexual perversions is such a decisive argument in this question, why has it not long since had its effect and settled the matter? I really cannot say. I think it is connected with the fact that these sexual perversions are subject to a quite special ban, which has even affected theory and has stood in the way of the scientific consideration of them. It is as though no-one could forget that they are not only something disgusting but also something monstrous and dangerous – as though people felt them as seductive, and had at bottom to fight down a secret envy of those who were enjoying them. One is reminded of the admission made by the condemnatory Landgraf in the famous *Tannhäuser* parody:

> 'Im Venusberg vergass er Ehr und Pflicht!
> – Merkwürdig, unser einem passiert
> so etwas nicht.'[1]

In reality perverts are poor wretches, rather, who have to pay extremely dear for their hard-won satisfaction.

What makes the activity of perverts so unmistakably sexual in spite of all the strangeness of its objects and aims is the fact that as a rule an act of perverse satisfaction nevertheless ends in complete orgasm and voidance of the genital products. This is of course only the result of the people concerned being adults. In children orgasm and genital excretion are scarcely possible; their place is taken by hints which are once more not recognized as being clearly sexual.

There is something else that I must add in order to complete our view [322]
of sexual perversions. However infamous they may be, however sharply they may be contrasted with normal sexual activity, quiet consideration will show that some perverse trait or other is seldom absent from the sexual life of normal people. Even a kiss can claim to be described as a perverse act, since it consists in the bringing together of two oral

1 ['The Venusberg made him forget
Honour and Duty thus! –
Strange how these things don't happen
To people such as us.' – By Nestroy (cf. p. 311 *n.* below).]

erotogenic zones instead of the two genitals. Yet no-one rejects it as perverse; on the contrary, it is permitted in theatrical performances as a softened hint at the sexual act. But precisely kissing can easily turn into a complete perversion – if, that is to say, it becomes so intense that a genital discharge and orgasm follow upon it directly, an event that is far from rare. We can learn, too, that for one person feeling and looking at the object are indispensable preconditions of sexual enjoyment, that another person will pinch or bite at the climax of sexual excitation, that the highest pitch of excitement in lovers is not always provoked by the genitals but by some other region of the object's body, and any number of similar things besides. There is no sense in excluding people with individual traits of this kind from the class of the normal and putting them among the perverts. On the contrary, we shall recognize more and more clearly that the essence of the perversions lies not in the extension of the sexual aim, not in the replacement of the genitals, not even always in the variant choice of the object, but solely in the exclusiveness with which these deviations are carried out and as a result of which the sexual act serving the purpose of reproduction is put on one side. Insofar as the perverse actions are inserted in the performance of the normal sexual act as preparatory or intensifying contributions, they are in reality not perversions at all. The gulf between normal and perverse sexuality is, of course, very much narrowed by facts of this kind. It is an easy conclusion that normal sexuality has emerged out of something that was in existence before it, by weeding out certain features of that material as unserviceable and collecting together the rest in order to subordinate them to a new aim, that of reproduction.

Before we make use of our familiarity with the perversions to plunge once again into the study of infantile sexuality on the basis of clearer premises, I must draw your attention to an important difference
[323] between them. Perverse sexuality is as a rule excellently centred: all its actions are directed to an aim – usually to a single one; one component drive has gained the upper hand in it and is either the only one observable or has subjected the others to its purposes. In that respect there is no distinction between perverse and normal sexuality other than the fact that their dominating component drives and consequently their sexual aims are different. In both of them, one might say, a well-organized tyranny has been established, but in each of the two a different family has seized the reins of power. Infantile sexuality, on the other hand, lacks, speaking generally, any such centring and organization; its separate component drives have equal rights, each of them goes its own way to

obtaining pleasure. Both the absence and the presence of centring harmonize well, of course, with the fact that both perverse and normal sexuality have arisen out of infantile sexuality. Incidentally, there are also cases of perverse sexuality which have a much greater resemblance to the infantile kind, since in them numerous component drives have put through (or, more correctly, have persisted in) their aims independently of one another. It is better in such cases to speak of infantilism in sexual life rather than of a perversion.

Thus forearmed we can proceed to the consideration of a suggestion which we shall certainly not be spared. 'Why', we shall be asked, 'are you so obstinate in describing as being already sexuality what on your own evidence are indefinable manifestations in childhood out of which sexual life will later develop? Why should you not be content instead with giving them a physiological description and simply say that in an infant at the breast we already observe activities, such as sensual sucking or holding back the excreta, which show us that he is striving for "organ pleasure"?[1] In that way you would have avoided the hypothesis, so repugnant to every feeling, of the smallest babies having a sexual life.' – Indeed, gentlemen, I have no objection at all to organ pleasure. I know that even the supreme pleasure of sexual union is only an organ pleasure [324] attached to the activity of the genitals. But can you tell me when this originally indifferent organ pleasure acquires the sexual character which it undoubtedly possesses in the later phases of development? Do we know any more about 'organ pleasure' than about sexuality? You will reply that it gains its sexual character precisely when the genitals begin to play their part; 'sexual' coincides with 'genital'. You will even reject the objection raised by the perversions by pointing out to me that in the majority of perversions a genital orgasm is after all aimed at, even if it is arrived at by a method other than the union of the genitals. You are certainly taking up a much stronger position in determining the characteristics of what is sexual if you knock out of it the relation to reproduction which is made untenable by the perversions and put genital activity in its place. But, if so, we are no longer far apart: it is only a question of the genital organs versus the other organs. What are you going to do, however, about the numerous experiences which show you that the genitals can be represented as regards their yield of pleasure by other

1 ['*Organlust*.' The term occurs in 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 110, where Freud seems to have used it for the first time. He uses it again in the *New Introductory Lectures* (1933*a*), ibid., **22**, 86. The *concept*, of course, is familiar from the time of the *Three Essays* (1905*d*), e.g. ibid., **7**, 174 f.]

organs, as in the case of kissing or of the perverse practices of voluptuaries or of the symptoms of hysteria? In that neurosis it is quite usual for signs of stimulation, sensations and innervations, and even the processes of erection, which belong properly to the genitals, to be displaced on to other, remote regions of the body – as, for instance, by transposition upwards, to the head and face. Being thus convinced that you have nothing to catch hold of for your characterization of what is sexual, you will no doubt have to make up your minds to follow my example and extend the description of being 'sexual' to the activities of early childhood, too, which strive for organ pleasure.

And now, for my justification, there are two other considerations which I must ask you to take into account. As you know, we call the dubious and indefinable pleasurable activities of earliest childhood sexual because, in the course of analysis, we arrive at them from the symptoms after passing through indisputably sexual material. They need not necessarily themselves be sexual on that account – agreed! But take an analogous case. Suppose we had no means of observing the development from their seed of two dicotyledonous plants, the apple tree and
[325] the bean, but that it was possible in both cases for us to trace their development backwards from the fully developed individual plant to the first seedling with two seed leaves. The two seed leaves have a neutral appearance; they are just alike in both cases. Am I then to suppose that they are really alike, and that the specific difference between an apple tree and a bean is only introduced into the plants later? Or is it biologically more correct to believe that this difference is already there in the seedling, although I cannot observe any distinction in the seed leaves? But we are doing the same thing when we call the pleasure in the activities of an infant in arms a sexual one. I cannot discuss here whether each and every organ pleasure should be called a sexual one or whether, alongside of the sexual one, there is another which does not deserve to be so called. I know too little about organ pleasure and its determinants; and, in view of the retrogressive [*rückschreitenden*] character of analysis in general, I cannot feel surprised if at the very end I arrive at what are for the time being indefinable factors.

And one thing more! On the whole you will have gained very little for what you want to assert – the sexual purity of children – even if you succeed in convincing me that it would be better to regard the activities of infants in arms as nonsexual. For the sexual life of children is already free from all these doubts from the third year of life onwards: at about that time the genitals already begin to stir, a period of infantile

masturbation – of genital satisfaction, therefore – sets in, regularly perhaps. The mental and social phenomena of sexual life need no longer be absent; the choice of an object, an affectionate preference for particular people, a decision, even, in favour of one of the two sexes, jealousy – all these have been established by impartial observations made independently of psychoanalysis and before its time, and they can be confirmed by any observer who cares to see them. You will object that you have never doubted the early awakening of affection; you have doubted only whether this affection bears a 'sexual' character. It is true that children have already learnt to conceal this between the ages of three and eight. But if you are attentive you will be able nevertheless to collect enough evidence of the 'sensual' aims of this affection, and whatever you still lack after that can easily be supplied in plenty by the investigations of analysis. The sexual aims at this period of life are intimately connected [326] with the child's contemporary sexual researches, of which I have given you some instances [p. 279 above]. The perverse character of some of these aims is of course dependent on the child's constitutional immaturity, for he has not yet discovered the aim that consists in the act of copulation.

From about the sixth to the eighth year of life onwards, we can observe a halt and retrogression [*Rückgang*] in sexual development, which, in cases where it is most propitious culturally, deserves to be called a period of latency. The latency period may also be absent: it need not bring with it any interruption of sexual activity and sexual interests along the whole line. The majority of experiences and mental impulses before the start of the latency period now fall victim to infantile amnesia – the forgetting (already discussed by us [Vol. 15, p. 173 ff. above]) which veils our earliest youth from us and makes us strangers to it. The task is set us in every psychoanalysis of bringing this forgotten period back into memory. It is impossible to avoid a suspicion that the beginnings of sexual life which are included in that period have provided the motive for its being forgotten – that this forgetting, in fact, is an outcome of repression.

From the third year of life a child's sexual life shows much agreement with an adult's. It differs from the latter, as we already know, in lacking a firm organization under the primacy of the genitals, in its inevitable traits of perversion and also, of course, in the far lesser intensity of the whole trend. But from the point of view of theory the most interesting phases of sexual, or, as we will say, of libidinal, development lie earlier than this point of time. This course of development takes place so

rapidly that we should probably never have succeeded in getting a firm hold of its fleeting pictures by direct observation. It was only with the help of the psychoanalytic investigation of the neuroses that it became possible to discern the still earlier phases of the development of the libido. These are nothing but constructions, to be sure, but, if you carry out psychoanalyses in practice, you will find that they are necessary and useful constructions. You will soon learn how it comes about that pathology can here reveal to us connections which we should inevitably overlook in a normal subject.

[327] Accordingly, I can now describe to you the form taken by a child's sexual life before the establishment of the primacy of the genitals, preparations for which are made in the first period of infancy preceding the latency period and which is permanently organized from puberty onwards. A kind of loose organization which may be called 'pregenital' exists during this early period. During this phase what stand at the forefront are not the genital component drives but the sadistic and anal ones. The contrast between 'masculine' and 'feminine' plays no part here as yet. Its place is taken by the contrast between 'active' and 'passive', which may be described as a precursor to the sexual polarity and which later on is soldered to that polarity. What appears to us as masculine in the activities of this phase, when we look at it from the point of view of the genital phase, turns out to be an expression of a drive to mastery [*Bemächtigungstriebes*] which easily passes over into cruelty. Trends with a passive aim are attached to the erotogenic zone of the anal orifice, which is very important at this period. The drives to look and to gain knowledge [*Schau- und Wisstrieb*; the scopophilic and epistemophilic drives] are powerfully at work; the genitals actually play a part in sexual life only as organs for the excretion of urine. The component drives of this phase are not without objects, but those objects do not necessarily converge into a single object. The sadistic-anal organization is the immediate forerunner of the phase of genital primacy. Detailed study shows how much of it is retained in the later definitive shape of things and shows too the way in which its component drives are compelled to take their place in the new genital organization.[1] Behind the sadistic-anal phase of libidinal development we get a glimpse of a still earlier and more primitive stage of organization, in which the erotogenic zone of the mouth plays the chief part. As you will guess, the sexual activity of sensual sucking [p. 276 above] belongs to it. We must admire the

1 [Freud afterwards interposed a 'phallic' phase between the sadistic-anal and genital organizations (Freud, 1923*e*; *RSE*, **19**, 131 ff.).]

understanding of the ancient Egyptians who, in their art, represented children, including the God Horus, with a finger in their mouth. Only recently Abraham [1916] has given examples of the traces which this primitive oral phase leaves behind it in later sexual life.

I can well suppose, gentlemen, that this last account of the sexual [328] organizations has obstructed rather than instructed you, and it may be that I have once more entered too much into details. But you must have patience. What you have just heard will derive increased value for you from its later application. For the present you should keep firmly in mind that sexual life (or, as we put it, the libidinal function) does not emerge as something ready-made and does not even develop further in its own likeness, but passes through a series of successive phases which do not resemble one another; its development is thus several times repeated – like that of a caterpillar into a butterfly. The turning point of this development is the subordination of all the component sexual drives under the primacy of the genitals and along with this the subjection of sexuality to the reproductive function. This is preceded by a sexual life that might be described as distracted – the independent activity of the different component drives striving for organ pleasure. This anarchy is mitigated by abortive beginnings of 'pregenital' organizations – a sadistic-anal phase preceded by an oral one, which is perhaps the most primitive. In addition, there are the various, still incompletely known, processes which lead one stage of organization over to the subsequent and next higher one. We shall learn later[1] what an important light is thrown on the neuroses by the fact that the libido passes through such a long course of development and one which has so many breaks in it.

Today we will follow yet another side of this development – namely the relation of the component sexual drives to their object. Or rather, we will make a hasty survey of this development and dwell somewhat longer on one of its rather late consequences. A few of the components of the sexual drive, then, have an object from the first and hold fast to it – for instance, the drive to mastery (sadism) and the scopophilic and epistemophilic drives. Others, more definitely linked to particular erotogenic zones of the body, have one to begin with only, so long as they are still attached to [*anlehnen*] the nonsexual functions [cf. p. 276 above], and give it up when they become separated from them. Thus the first object of the oral component of the sexual drive is the mother's breast which satisfies the infant's need for nourishment. The erotic component, which [329]

1 [Actually in the next lecture.]

is satisfied simultaneously during the [nutritive] sucking, makes itself independent with the act of *sensual* sucking [*Lutschens*]; it gives up the outside object and replaces it with an area of the subject's own body. The oral drive becomes *auto-erotic*, as are the anal and other erotogenic drives from the first. Further development, to put the matter as concisely as possible, has two aims: firstly, the abandonment of auto-erotism, the replacement of the subject's own body once more with an outside object, and secondly, the unification of the various objects of the separate drives and their replacement with a single object. This can, of course, only be achieved if the object is again a whole body, similar to the subject's own. Nor can it be effected unless a number of the auto-erotic drive impulses are left behind as being unserviceable.

The processes of finding an object are fairly complex and no comprehensive account has hitherto been given of them. For our purposes it may be specially pointed out that when, in the years of childhood before puberty, the process has in some respects reached a conclusion, the object that has been found turns out to be almost identical to the first object of the oral pleasure drive, which was reached by attachment [to the nutritional drive].[1] Though it is not actually the mother's breast, at least it is the mother. We call the mother the first *love* object. For we speak of love when we bring the mental side of the sexual trends into the foreground and want to force back the underlying physical or 'sensual' drive demands or to forget them for a moment. At the time at which the child's mother becomes his love object the psychical work of repression has already begun in him, which is withdrawing from his knowledge awareness of a part of his sexual aims. To his choice of his mother as a love object everything becomes attached which, under the name of the 'Oedipus complex', has attained so much importance in the psychoanalytic explanation of the neuroses and has played no less a part, perhaps, in the resistance to psychoanalysis. [Cf. Vol. 15, p. 180 above.][2]

[330] Listen to this episode which occurred in the course of the present war. One of the stout disciples of psychoanalysis was stationed as medical officer on the German front somewhere in Poland. He attracted his colleagues' attention by the fact that he occasionally exercised an unexpected influence on a patient. When he was questioned, he acknowledged that he was employing the methods of psychoanalysis and

1 [This is further explained in Lecture XXVI, p. 376 below.]

2 [Freud's first published account of the Oedipus complex was given in *I. of D.*, **4**, 231–6, though he had put it forward earlier in a letter to Fliess of October 15, 1897 (Freud, 1950*a*, Letter 71). The actual term 'Oedipus complex' was first introduced much later, in a paper on a special type of object choice (1910*h*), *RSE*, **11**, 158.]

declared his readiness to convey his knowledge to his colleagues. Every evening thereafter the medical officers of the corps, his colleagues and his superiors, came together in order to learn the secret doctrines of analysis. All went well for a while; but when he spoke to his audience about the Oedipus complex, one of his superiors rose, declared he did not believe it, that it was a vile act on the part of the lecturer to speak of such things to them, honest men who were fighting for their country and fathers of a family, and that he forbade the continuance of the lectures. That was the end of the matter. The analyst got himself transferred to another part of the front. It seems to me a bad thing, however, if a German victory requires that science shall be 'organized' in this way, and German science will not respond well to organization of such a kind.

And now you will be eager to hear what this terrible Oedipus complex contains. Its name tells you. You all know the Greek legend of King Oedipus, who was destined by fate to kill his father and take his mother to wife, who did everything possible to escape the oracle's decree and punished himself by blinding when he learnt that he had nonetheless unwittingly committed both these crimes. I hope many of you may yourselves have felt the shattering effect of the tragedy in which Sophocles has treated the story. The work of the Athenian dramatist exhibits the way in which the long-past deed of Oedipus is gradually brought to light by an investigation ingeniously protracted and fanned into life by ever fresh relays of evidence. To this extent it has a certain resemblance to the progress of a psychoanalysis. In the course of the dialogue Jocasta, the deluded mother and wife, declares herself opposed to the continuance of the inquiry. She appeals to the fact that [331]
many people have dreamt of lying with their mothers, but that dreams should be despised. We do not despise dreams – least of all, typical dreams which occur to many people; and we do not doubt that the dream referred to by Jocasta has an intimate connection with the strange and terrifying content of the legend.

It is a surprising thing that the tragedy of Sophocles does not call up indignant repudiation in his audience – a reaction similar to that of our simple-minded army doctor but far better justified. For fundamentally it is an amoral work: it absolves men of moral responsibility, exhibits the gods as promoters of crime and shows the impotence of the moral impulses of men which struggle against crime. It might easily be supposed that the material of the legend had in view an indictment of the gods and of fate; and in the hands of Euripides, the critic and enemy of

the gods, it would probably have become such an indictment. But with the devout Sophocles there is no question of an application of that kind. The difficulty is overcome by the pious sophistry that to bow to the will of the gods is the highest morality even when it promotes crime. I cannot think that this morality is a strong point of the play, but it has no influence on its effect. It is not to it that the auditor reacts but to the secret sense and content of the legend. He reacts as though by self-analysis he had recognized the Oedipus complex in himself and had unveiled the will of the gods and the oracle as exalted disguises of his own unconscious. It is as though he was obliged to remember the two wishes – to do away with his father and in place of him to take his mother to wife – and to be horrified at them. And he understands the dramatist's voice as though it were saying to him: 'You are struggling in vain against your responsibility and are protesting in vain of what you have done in opposition to these criminal intentions. You are guilty, for you have not been able to destroy them; they still persist in you unconsciously.' And there is psychological truth contained in this. Even if a man has repressed his evil impulses into the unconscious and would like to tell himself afterwards that he is not responsible for them, he is nevertheless bound to be aware of this responsibility as a sense of guilt whose basis is unknown to him.[1]

[332] There can be no doubt that the Oedipus complex may be looked upon as one of the most important sources of the sense of guilt by which neurotics are so often tormented. But more than this: in a study of the beginnings of human religion and morality which I published in 1913 under the title of *Totem and Taboo* [Freud, 1912–13*a*; *RSE*, **13**] I put forward a suggestion that mankind as a whole may have acquired its sense of guilt, the ultimate source of religion and morality, at the beginning of its history, in connection with the Oedipus complex. I should be very glad to tell you more about this, but I had better leave it on one side. Once one has begun on that topic it is hard to break off; and we must go back to individual psychology.

What, then, can be gathered about the Oedipus complex from the direct observation of children at the time of their making their choice of an object before the latency period? Well, it is easy to see that the little man wants to have his mother all to himself, that he feels the presence of his father as a nuisance, that he is resentful if his father indulges in any signs of affection towards his mother and that he shows satisfaction

1 [Cf. a paragraph near the end of Lecture XIII, Vol. 15, p. 183 above.]

when his father has gone on a journey or is absent. He will often express his feelings directly in words and promise his mother to marry her. It will be thought that this amounts to little compared to the deeds of Oedipus; but in fact it is enough, it is the same thing at root. Observation is often obscured by the circumstance that on other occasions the same child will simultaneously give evidence of great affection for his father. But contrary – or, as it is better to say, 'ambivalent'[1] – emotional attitudes, which in adults would lead to a conflict, remain compatible with each other for a long time in children, just as later they find a permanent place beside each other in the unconscious. It will also be objected that the little boy's conduct arises from egoistic motives and gives no grounds for postulating an erotic complex: the child's mother attends to all his needs, so that he has an interest in preventing her from looking after anyone else. This also is true; but it will soon become clear that in this situation as in similar ones the egoistic interest[2] is merely affording a point of support [*Anlehnung*] to which the erotic trend is attached. The [333]
little boy may show the most undisguised sexual curiosity about his mother, he may insist upon sleeping beside her at night, he may force his presence on her while she is dressing or may even make actual attempts at seducing her, as his mother will often notice and report with amusement – all of which puts beyond doubt the erotic nature of his tie with his mother. Nor must it be forgotten that the mother devotes the same attention to a little daughter without producing the same result[3] and that the father often competes with her in looking after the boy and yet fails to gain the same significance as she does. In short, the factor of sexual preference cannot be eliminated from the situation by any criticism. From the standpoint of egoistic interest it would be simply foolish of the little man not to prefer to put up with having two people in his service rather than only one of them.

As you see, I have only described the relation of a *boy* to his father and mother. Things happen in just the same way with little girls, with the necessary changes:[4] an affectionate attachment to her father, a need to

1 [See below, p. 377.]

2 [This term (*egoistische Interesse*) recurs many times in Lecture XXVI, where some editorial comment is made on it (p. 366 *n.* below).]

3 [See, however, footnote 4 below.]

4 [It was not till many years later that Freud became fully aware of the lack of symmetry in the Oedipus relations of the two sexes. This emerged in his paper on 'Some Psychical Consequences of the Anatomical Distinction between the Sexes' (1925*j*), *RSE*, **19**, 249 ff., and was elaborated in the later one on 'Female Sexuality' (1931*b*), ibid., **21**. He discussed the question again in Lecture XXXIII of the *New Introductory Lectures* (1933*a*), ibid., **22**, and lastly in Chapter VII of his posthumous *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**.]

get rid of her mother as superfluous and to take her place, a coquetry which already employs the methods of later womanhood – these offer a charming picture, especially in small girls, which makes us forget the possibly grave consequences lying behind this infantile situation. We must not omit to add that the parents themselves often exercise a determining influence on the awakening of a child's Oedipus attitude by themselves obeying the pull of sexual attraction, and that where there are several children the father will give the plainest evidence of his greater affection for his little daughter and the mother for her son. But the spontaneous nature of the Oedipus complex in children cannot be seriously shaken even by this factor.

When other children appear on the scene the Oedipus complex is
[334] enlarged into a family complex. This, with fresh support from the egoistic sense of injury, gives grounds for receiving the new brothers or sisters with repugnance and for unhesitatingly getting rid of them by a wish. It is even true that as a rule children are far readier to give verbal expression to *these* feelings of hate than to those arising from the parental complex. If a wish of this kind is fulfilled and the undesired addition to the family is removed again shortly afterwards by death, we can discover from a later analysis what an important experience this death has been to the child, even though it need not have remained fixed in his memory. A child who has been put into second place by the birth of a brother or sister, and who is now for the first time almost isolated from his mother, does not easily forgive her this loss of place; feelings which in an adult would be described as greatly embittered arise in him and are often the basis of a permanent estrangement. We have already mentioned [p. 280 above] that the child's sexual researches, with all their consequences, usually follow from this vital experience of his. As these brothers and sisters grow up, the boy's attitude to them undergoes very significant transformations. He may take his sister as a love object by way of substitute for his faithless mother. Where there are several brothers, all of them courting a younger sister, situations of hostile rivalry, which are so important for later life, arise already in the nursery. A little girl may find in her elder brother a substitute for her father who no longer takes an affectionate interest in her as he did in her earliest years. Or she may take a younger sister as a substitute for the baby she has vainly wished for from her father.

This and very much else of a similar nature will be shown to you by the direct observation of children and by the consideration of clearly retained memories from childhood uninfluenced by analysis. From this

you will conclude among other things that the position of a child in the family order is a factor of extreme importance in determining the shape of his later life and should deserve consideration in every life history. But, what is more important, in view of this information which can be so easily obtained, you will not be able to recall without a smile the pronouncements of science in explanation of the prohibition of incest. [Cf. Vol. 15, p. 182 f. above.] There is no end to what has been invented on the subject. It has been said that sexual inclination is diverted from members of the same family who are of the opposite sex by the fact of [335] having lived together from childhood; or, again, that a biological purpose of avoiding inbreeding is represented psychically by an innate horror of incest. In all this the fact is entirely overlooked that such an inexorable prohibition of it in law and custom would not be needed if there were any reliable natural barriers against the temptation to incest. The truth is just the opposite. A human being's first choice of an object is regularly an incestuous one, aimed, in the case of the male, at his mother and sister; and it calls for the severest prohibitions to deter this persistent infantile tendency from realization. Among the primitive races still living today, among savages, the prohibitions against incest are even very much stricter than among ourselves, and Theodor Reik has only recently shown in a brilliant work [Reik, 1915–16] that the puberty rites of savages, which represent a rebirth, have the sense of releasing the boy from his incestuous bond with his mother and of reconciling him with his father.

Mythology will teach you that incest, which is supposed to be so much detested by humans, is unhesitatingly allowed to the gods. And you may learn from ancient history that incestuous sister-marriage was a sanctified injunction upon the person of the Ruler (among the Egyptian Pharaohs and the Incas of Peru). What was in question was thus a privilege forbidden to the common herd.

Mother incest was one of the crimes of Oedipus, parricide was the other. It may be remarked in passing that they are also the two great crimes proscribed by totemism, the first socio-religious institution of mankind.[1]

But let us now turn from the direct observation of children to the analytic examination of adults who have become neurotic. What help does analysis give towards a further knowledge of the Oedipus complex? That can be answered in a word. Analysis confirms all that the legend describes. It shows that each of these neurotics has himself been an Oedipus or,

1 [Cf. Freud's *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 11 ff.]

what comes to the same thing, has, as a reaction to the complex, become
[336] a Hamlet.[1] The analytic account of the Oedipus complex is, of course, a magnification and coarsening of the infantile sketch. The hatred of the father, the death wishes against him, are no longer hinted at timidly, the affection for the mother admits that its aim is to possess her as a woman. Should we really attribute such blatant and extreme emotional impulses to the tender years of childhood, or is analysis deceiving us by an admixture of some new factor? It is not hard to find one. Whenever someone gives an account of a past event, even if he is a historian, we must take into account what he unintentionally puts back into the past from the present or from some intermediate time, thus falsifying his picture of it. In the case of a neurotic it is even a question whether this putting back is an entirely unintentional one; later on we shall have to discover reasons for this and have to do justice in general to the fact of 'retrospective phantasying'.[2] We can easily see, too, that hatred of the father is reinforced by a number of factors arising from later times and circumstances and that the sexual desires towards the mother are cast into forms which must have been alien as yet to a child. But it would be a vain effort to seek to explain the whole Oedipus complex by retrospective phantasying and to attach it to later times. Its infantile core and more or less of its accessories remain as they were confirmed by the direct observation of children.

The clinical fact which meets us behind the form of the Oedipus complex as it is established by analysis is of the highest practical significance. We learn that at puberty, when the sexual drive first makes its demands in full strength, the old familiar incestuous objects are taken up again and freshly cathected[3] with libido. The infantile object choice was only a feeble one, but it was a prelude, pointing the direction for the object choice at puberty. At this point, then, very intense emotional processes come into play, following the direction of the Oedipus complex or reacting against it, processes which, however, since their premises have
[337] become intolerable, must to a large extent remain apart from consciousness. From this time onwards, the human individual has to devote himself to the great task of detaching himself from his parents,

1 [Freud's earliest published commentary on *Hamlet* (as well as on *Oedipus Rex*) appeared in *I. of D.*, **4**, 231–6.]

2 [*Rückphantasierens*. See the later part of Lecture XXIII, p. 325 ff. below.]

3 ['*besetzt*', charged with energy. The concept of '*Besetzungen* (cathexes)', charges of psychical energy, is fundamental to Freud's theories. A discussion of it can be found in an Editors' Appendix to an early paper of Freud's (1894*a*), *RSE*, **3**, 57 f. See also the translation notes in ibid., **24**, 59–61. The term reappears frequently below.]

and not until that task is achieved can he cease to be a child and become a member of the social community. For the son this task consists in detaching his libidinal wishes from his mother and employing them for the choice of a real outside love object, and in reconciling himself with his father if he has remained in opposition to him, or in freeing himself from his pressure if, as a reaction to his infantile rebelliousness, he has become subservient to him. These tasks are set to everyone; and it is remarkable how seldom they are dealt with in an ideal manner – that is, in one which is correct both psychologically and socially. By neurotics, however, no solution at all is arrived at: the son remains all his life bowed beneath his father's authority and he is unable to transfer his libido to an outside sexual object. With the relationship changed round, the same fate can await the daughter. In this sense the Oedipus complex may justly be regarded as the nucleus of the neuroses.[1]

As you may imagine, gentlemen, I have passed very cursorily over a great number of considerations of both practical and theoretical importance connected with the Oedipus complex. Nor shall I enter into its variations or its possible reversal.[2] Among its remoter connections I will only give you a further hint that it has turned out to have a highly important effect on literary production. In a valuable work Otto Rank [1912*c*] has shown that dramatists of every period have chosen their material in the main from the Oedipus and incest complex and its variations and disguises. Nor should it be allowed to pass unnoticed that the two criminal wishes of the Oedipus complex were recognized as the true representatives of the uninhibited life of the drives long before the time of psychoanalysis. Among the writings of the Encyclopaedist Diderot you will find a celebrated dialogue, *Le neveu de Rameau*, which was rendered into [338]
German by no less a person than Goethe. There you may read this remarkable sentence: 'Si le petit sauvage était abandonné à lui-même, qu'il conservât toute son imbécillité, et qu'il réunît au peu de raison de l'enfant au berceau la violence des passions de l'homme de trente ans, il tordrait le col à son père et coucherait avec sa mère.'[3]

1 [Freud had been using this phrase frequently for several years previously. It appears already in a footnote to his 'Rat Man' case history (1909*d*), *RSE*, **10**, 158 *n*.]

2 [This last point is most fully dealt with in Chapter III of *The Ego and the Id* (1923*b*), ibid., **19**, 27 ff.]

3 ['If the little savage were left to himself, preserving all his foolishness and adding to the small sense of a child in the cradle the violent passions of a man of thirty, he would strangle his father and lie with his mother.' Freud quoted this passage again (in Goethe's German version) in his note on 'The Expert Opinion in the Halsmann Case' (1930*i*), ibid., **21**, 244, and again (in French) at the end of Part II of his posthumous *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, 173.]

But there is something else that I cannot pass by. The reminder of dreams given to us by the mother and wife of Oedipus must not be allowed to remain fruitless. Do you recall the outcome of our dream analyses – how the wishes that construct dreams are so often of a perverse or incestuous nature or reveal an unsuspected hostility to those who are nearest and dearest to the dreamer? At that time [Vol. 15, p. 125 above] we gave no explanation of the origin of these evil impulses. Now you can find it for yourselves. They are allocations of the libido and object cathexes[1] which date from early infancy and have long since been abandoned as far as conscious life is concerned, but which prove still to be present at night-time and to be capable of functioning in a certain sense. Since, however, everyone, and not only neurotics, experiences these perverse, incestuous and murderous dreams, we may conclude that people who are normal today have passed along a path of development that has led through the perversions and object cathexes of the Oedipus complex, that that is the path of normal development and that neurotics merely exhibit to us in a magnified and coarsened form what the analysis of dreams reveals to us in healthy people as well. And this is one of the reasons why I dealt with the study of dreams before that of neurotic symptoms.

1 [I.e. charges of psychical energy concentrated upon objects. See footnote 3, p. 296 above.]

LECTURE XXII

SOME THOUGHTS ON DEVELOPMENT AND REGRESSION – AETIOLOGY

Ladies and Gentlemen, you have heard that the libidinal function goes [339]
through a lengthy development before it can, in what is described as the normal manner, be enlisted in the service of reproduction. I should now like to bring to your attention the significance of this fact in the causation of the neuroses.

We are, I think, in agreement with the theories of general pathology in assuming that a development of this kind involves two dangers – first, of *inhibition*, and secondly, of *regression*. That is to say, in view of the general tendency of biological processes to variation, it is bound to be the case that not every preparatory phase will be passed through with equal success and completely superseded: portions of the function will be permanently held back at these early stages, and the total picture of development will be qualified by some amount of developmental inhibition.

Let us look for some analogies to these processes in other fields of knowledge. When, as often happened at early periods of human history, a whole people left their place of domicile and sought a new one, we may be certain that the whole of them did not arrive at the new location. Apart from other losses, it must regularly have happened that small groups or bands of the migrants halted on the way and settled at these stopping places while the main body went further. Or, as you know, to turn to a nearer comparison, in the highest mammals the male sex glands, which are originally situated deep in the abdominal cavity, start upon a migration at a particular stage of intrauterine life, which brings them almost directly under the skin of the pelvic extremity. As a consequence of this migration, we find in a number of male individuals that one of these paired organs has remained behind in the pelvic cavity, or that it has become permanently lodged in what is known as the inguinal canal, through which both organs must pass in the course of their migration, or at least that this canal has remained open, though it should normally [340]
close up after the sex glands have completed their change of situation. Or

again, when as a young student I was engaged under von Brücke's direction on my first piece of scientific work, I was concerned with the origin of the posterior nerve roots in the spinal cord of a small fish of very archaic structure;[1] I found that the nerve fibres of these roots have their origin in large cells in the posterior horn of the grey matter, which is no longer the case in other vertebrates. But I also discovered soon afterwards that nerve cells of this kind are present outside the grey matter the whole way to what is known as the spinal ganglion of the posterior root; and from this I inferred that the cells of these masses of ganglia had migrated from the spinal cord along the roots of the nerves. This is also shown by their evolutionary history. But in this small fish the whole path of their migration was demonstrated by the cells that had remained behind.[2]

If you go into the matter more closely, you will have no difficulty in detecting the weak points in these comparisons. I will therefore declare without more ado that I regard it as possible in the case of every particular sexual trend that some portions of it have stayed behind at earlier stages of its development, even though other portions may have reached their final goal. You will recognize here that we are picturing every such trend as a current which has been continuous since the beginning of life but which we have divided up, to some extent artificially, into separate successive advances. Your impression that these ideas stand in need of greater clarification is justified; but to attempt it would take us too far afield. Let me further make it clear that we propose to describe the lagging behind of a part trend at an earlier stage as a *fixation* [*Fixierung*][T] – a fixation, that is, of the drive.

The second danger in a development by stages of this sort lies in the fact that the portions which have proceeded further may also easily return retrogressively to one of these earlier stages – what we describe as a *regression*. The trend will find itself led into a regression of this kind if
[341] the exercise of its function – that is, the attainment of its aim of satisfaction – is met, in its later or more highly developed form, by powerful external obstacles. It is plausible to suppose that fixation and regression are not independent of each other. The stronger the fixations on its path of development, the more readily will the function evade external difficulties by regressing to the fixations – the more incapable, therefore, does the developed function turn out to be of resisting external obstacles in its course. Consider that, if a people which is in movement has left strong

1 [The larval form of the brook lamprey.]

2 [This is a summary of the findings of two of Freud's very first papers (1877*a* and 1878*a*). His own earlier abstracts of them (1897*b*, Nos. II and III) can be found in *RSE*, **3**, 231–2. English translations of the articles themselves are included in *NSW*, **1**.]

detachments behind at the stopping places on its migration, it is likely that the more advanced parties will be inclined to retreat to these stopping places if they have been defeated or have come up against a superior enemy. But they will also be in the greater danger of being defeated the more of their number they have left behind on their migration.

It is important for your understanding of the neuroses that you should not leave this relation between fixation and regression out of sight. This will give you a firmer footing in facing the question of how the neuroses are caused – the question of the aetiology of the neuroses which we shall shortly have to meet.

For the moment we will dwell a little longer on regression. After what you have learnt of the development of the libidinal function, you will be prepared to hear that there are regressions of two sorts: a return to the objects first cathected by the libido, which, as we know, are of an incestuous nature, and a return of the sexual organization as a whole to earlier stages. Both sorts are found in the transference neuroses [p. 264 above] and play a great part in their mechanism. In particular, a return to the first incestuous objects of the libido is a feature that is found in neurotics with positively fatiguing regularity. There is much more to be said about regressions of the libido itself when we take into account as well another group of neuroses, the narcissistic ones, which for the time being we do not intend to do.[1] These disorders give us access to other developmental processes of the libidinal function which we have not yet mentioned, and show us correspondingly new sorts of regression as well. But above all I think I ought to warn you now not to confuse *regression* with *repression* and help you to form a clear idea of [342]
the relations between the two processes.[2] Repression, as you will recall [p. 260 ff.], is the process by which an act which is admissible to consciousness, one, therefore, which belongs to the system *Pcs*., is made unconscious – is pushed back, therefore, into the system *Ucs*.[3] And we equally speak of repression if the unconscious mental act is altogether forbidden access to the neighbouring preconscious system and is turned back at the threshold by the censorship. Thus the concept of repression involves no relation to sexuality: I must ask you to take special note of that. It indicates a purely psychological process, which we can characterize still better if we call it a 'topographical' one. By this we intend to

1 [They are discussed in Lecture XXVI, p. 364 ff. below.]

2 [The extremely close resemblance of the two words to each other is an added misfortune peculiar to English. In German no such similarity exists between '*Regression*' and '*Verdrängung*'.]

3 ['*Pcs*.' and '*Ucs*.' are the abbreviations (first introduced by Freud in the seventh chapter of *I. of D.*, **5**, 482 ff.) for the preconscious and unconscious mental systems.]

say that it is concerned with the psychical regions which we have assumed to exist, or, if we drop this clumsy working hypothesis, with the construction of the mental apparatus out of distinct psychical systems.

The comparison we have proposed has drawn our attention for the first time to the fact that we have not hitherto been using the word 'regression' in its general sense but in a quite special one. If we give it its general sense – of a return from a higher to a lower stage of development – then repression too can be subsumed under the concept of regression, for it too can be described as a return to an earlier and deeper stage in the development of a psychical act. In the case of repression, however, this retrogressive movement does not concern us, since we also speak of repression, in the *dynamic* sense, when a psychical act is held back at the lower, unconscious, stage. The fact is that repression is a topographico-dynamic concept, while regression is a purely descriptive one. What we have hitherto spoken of as regression, however, and have related to fixation, has meant exclusively a return of the libido to earlier stopping places in its development – something, that is, entirely different in its nature from repression and entirely independent of it. Nor can we call regression of the libido a purely psychical process and we cannot tell
[343] where we should localize it in the mental apparatus. And though it is true that it exercises the most powerful influence on mental life, yet the most prominent factor in it is the organic one.

Discussions like this, gentlemen, are bound to become somewhat arid. So let us turn to clinical material in order to find applications of it that will be a little more impressive. Hysteria and obsessional neurosis are, as you know, the two chief representatives of the group of transference neuroses. Now it is true that in hysteria there is a regression of the libido to the primary incestuous sexual objects and that this occurs quite regularly; but there is as good as no regression to an earlier stage of the sexual organization. To offset this, the chief part in the mechanism of hysteria is played by repression. If I might venture to complete what we already know for certain about this neurosis by making a construction, I might explain the position thus. The unification of the component drives under the primacy of the genitals has been accomplished; but its results come up against the resistance of the preconscious system which is linked with consciousness. Thus the genital organization holds good for the unconscious, but not in the same way for the preconscious; and this rejection on the part of the preconscious brings about a picture

which has certain resemblances to the state of things before genital primacy. But it is nevertheless something quite different.

Of the two kinds of regression of the libido, that to an earlier phase of the sexual organization is by far the more striking. Since this is absent in hysteria, and since our whole view of the neuroses is still far too much under the influence of the study of hysteria, which was chronologically the first, the significance of libidinal regression also became clear to us far later than that of repression. We must be prepared to find that our views will be subjected to still further extensions and revaluations when we are able to take into consideration not only hysteria and obsessional neurosis but also the other, narcissistic neuroses.

In obsessional neurosis, on the contrary, it is the regression of the libido to the preliminary stage of the sadistic-anal organization that is the most striking fact and the one which is decisive for what is manifested in symptoms. The love impulsion is obliged, when this has happened, to disguise itself as a sadistic impulsion. The obsessional idea 'I should like [344] to kill you', when it has been freed from certain additions which are not a matter of chance but are indispensable, means at bottom nothing other than 'I should like to enjoy you in love'. If you consider further that there has been a simultaneous regression in regard to the object, so that these impulsions apply only to those who are nearest and dearest to the patient, you can form some idea of the horror which these obsessions arouse in him and at the same time of the alien appearance which they present to his conscious perception. But repression, too, plays a great part in the mechanism of these neuroses, though in a cursory introduction like ours this is not easily demonstrated. A regression of the libido without repression would never produce a neurosis but would lead to a perversion. From this you can see that repression is the process which is most peculiar to neuroses and is most characteristic of them. Perhaps I may have an opportunity later of telling you what we know of the mechanism of the perversions, and you will see that in their case too things are not so simple as we should be glad to make them out.[1]

I think, gentlemen, that you will best come to terms with what you have just been told about fixation and regression of the libido if you will regard it as a preparation for research into the aetiology of the neuroses. Hitherto I have given you only one piece of information about this: namely that people fall ill of a neurosis if they are deprived of the

1 [This seems to be one of the points to which, as he remarks at the end of these lectures (p. 409 below), he had no opportunity of returning.]

possibility of satisfying their libido – that they fall ill owing to 'frustration', as I put it – and that their symptoms are precisely a substitute for their frustrated satisfaction. [Cf. p. 265 above.] This is not supposed to mean, of course, that every frustration of a libidinal satisfaction makes the person it affects neurotic, but merely that the factor of frustration could be discerned in every case of neurosis that has been examined. Thus [as logicians would say] the proposition is not convertible. No doubt, too, you will have understood that this assertion does not claim to reveal the whole secret of the aetiology of neuroses but is bringing into prominence only one important and indispensable determinant.

[345] In further pursuing the discussion of this thesis, are we to consider the nature of the frustration or the peculiar character of those who are affected by it? It is extremely seldom, after all, that frustration is universal and absolute. In order to operate pathogenically it must no doubt affect the mode of satisfaction which alone the subject desires, of which alone he is capable. There are in general very many ways of tolerating deprivation of libidinal satisfaction without falling ill as a result. In the first place, we know people who are able to put up with a deprivation of this kind without being injured: they are not happy, they suffer from longing, but they do not fall ill. Next, we must bear in mind that the sexual drive impulses in particular are extraordinarily *plastic*, if I may so express it. One of them can take the place of another, one of them can take over another's intensity; if the satisfaction of one of them is frustrated by reality, the satisfaction of another can afford complete compensation. They are related to one another like a network of intercommunicating channels filled with a liquid;[1] and this is so in spite of their being subject to the primacy of the genitals – a state of affairs that is not at all easily combined in a single picture. Further, the component drives of sexuality, as well as the sexual trend which is compounded from them, exhibit a large capacity for changing their object, for taking another in its place – and one, therefore, that is more easily attainable. This displaceability and readiness to accept a substitute must operate powerfully against the pathogenic effect of a frustration. Among these protective processes against falling ill owing to deprivation there is one which has gained special cultural significance. It consists in the sexual trend abandoning its aim of obtaining a component or a reproductive pleasure and taking on another which is related genetically to the abandoned one but is itself no longer sexual and must be described as social.

1 [Cf. footnote 1, p. 273 above.]

We call this process 'sublimation' [*Sublimierung*], in accordance with the general estimate that places social aims higher than the sexual ones, which are at bottom self-interested. Sublimation is, incidentally, only a special case of the way in which sexual trends are attached to [*Anlehnung*] other, nonsexual ones [cf. p. 276 above]. We shall have to discuss it again in another connection.[1]

You may now have an impression that deprivation has been reduced [346]
to insignificance owing to all these methods of tolerating it. But no, it retains its pathogenic power. The countermeasures are on the whole insufficient. There is a limit to the amount of unsatisfied libido that human beings on the average can put up with. The plasticity or free mobility of the libido is by no means fully preserved in everyone, and sublimation is never able to deal with more than a certain fraction of libido, quite apart from the fact that many people are gifted with only a small amount of capacity to sublimate. The most important of these limitations is evidently that upon the mobility of the libido, since it makes a person's satisfaction depend on the attainment of only a very small number of aims and objects. You have only to recall that an imperfect development of the libido leaves behind it very fertile and perhaps, too, very numerous libidinal fixations to early phases of the organization and of the finding of objects, which are for the most part incapable of real satisfaction, and you will recognize in libidinal fixation the second powerful factor which combines with frustration as the cause of illness. You can declare, as a schematic abbreviation, that libidinal fixation represents the predisposing, internal factor in the aetiology of the neuroses, while frustration represents the accidental, external one.

I take the opportunity here of warning you against taking sides in a quite unnecessary dispute. In scientific matters people are very fond of selecting one portion of the truth, putting it in the place of the whole and of then disputing the rest, which is no less true, in favour of this one portion. In just this way a number of schools of opinion have already split off from the psychoanalytic movement, some of which recognize the egoistic drives while disavowing the sexual ones, and others attribute importance to the influence of the real tasks of life while overlooking the individual's past[2] – and others besides. Now here we have a similar occasion for pointing to a contrast and starting a controversy. Are neuroses *exogenous* or *endogenous* illnesses? Are they the inevitable result of a

1 [See the end of the next lecture, p. 331 f. below.]

2 [The schools of Adler and Jung had been discussed at some length by Freud in Section III of his 'History of the Psychoanalytic Movement' (1914*d*), *RSE*, **14**, 37 ff.]

particular constitution or the product of certain detrimental (traumatic) experiences in life? More particularly, are they brought about by fixation
[347] of the libido (and the other features of the sexual constitution) or by the pressure of frustration? This dilemma seems to me no more sensible on the whole than another that I might put to you: does a baby come about through being begotten by its father or conceived by its mother? Both determinants are equally indispensable, as you will justly reply. In the matter of the causation of the neuroses the relation, if not precisely the same, is very similar. As regards their causation, instances of neurotic illness fall into a series within which the two factors – sexual constitution and experience, or, if you prefer it, fixation of the libido and frustration – are represented in such a manner that if there is more of the one there is less of the other. At one end of the series are the extreme cases of which you could say with conviction: these people, in consequence of the singular development of their libido, would have fallen ill in any case, whatever they had experienced and however carefully their lives had been sheltered. At the other end there are the cases, as to which, on the contrary, you would have had to judge that they would certainly have escaped falling ill if their lives had not brought them into this or that situation. In the cases lying within the series a greater or lesser amount of predisposition in the sexual constitution is combined with a lesser or greater amount of detrimental experience in their lives. Their sexual constitution would not have led them into a neurosis if they had not had these experiences, and these experiences would not have had a traumatic effect on them if their libido had been otherwise disposed. In this series I can perhaps allow a certain preponderance in significance to the predisposing factors; but even that admission depends on how far you choose to extend the frontiers of neurotic illness.

I propose, gentlemen, that we should name a series of this kind a 'complemental series', and I forewarn you that we shall have occasion to construct others of the same kind.[1]

[348] The tenacity with which the libido adheres to particular trends and objects – what may be described as the 'adhesiveness' of the libido – makes its appearance as an independent factor, varying from individual to individual, whose determinants are quite unknown to us, but whose

1 [This seems to be Freud's first use of the actual term 'complemental series' (*Ergänzungsreihen*). The concept goes back a long way. It appears in a somewhat different form as an 'aetiological equation' in the second paper on anxiety neurosis (1895*f*), where some discussion of the history of the notion can be found in an Editors' Note, *RSE*, **3**, 107–8. It reappears at three points below (pp. 320, 321 and 327), and turns up again in the *New Introductory Lectures* (1933*a*), *RSE*, **22**, 111, and in Essay III, Part I (C) of *Moses and Monotheism* (1939*a*), ibid., **23**, 68.]

significance for the aetiology of the neuroses we shall certainly no longer underestimate.[1] We should not, on the other hand, overestimate the intimacy of this connection. For a similar 'adhesiveness' of the libido occurs (for unknown reasons) under numerous conditions in normal people, and it is found as a determining factor in people who are in one sense the contrary of neurotics – in perverts. It was known even before the days of psychoanalysis (cf. Binet [1888]) that in the anamnesis of perverts a very early impression of an abnormal drive trend or choice of object was quite often found, to which the subject's libido remained attached all through his life. It is often impossible to say what it is that enabled this impression to exercise such an intense attraction on the libido. I will describe a case of this sort which I myself observed.

The subject was a man who is today quite indifferent to the genitals and other attractions of women, but who can be plunged into irresistible sexual excitement only by a foot of a particular form wearing a shoe. He can recall an event from his sixth year which was decisive for the fixation of his libido. He was sitting on a stool beside the governess who was to give him lessons in English. The governess, who was an elderly, dried-up, plain-looking spinster, with pale-blue eyes and a snub nose, had something wrong with her foot that day, and on that account kept it, wearing a velvet slipper, stretched out on a cushion. Her leg itself was most decently concealed. A thin, scraggy foot, like the one he had then seen belonging to his governess, thereupon became (after a timid attempt at normal sexual activity at puberty) his only sexual object; and the man was irresistibly attracted if a foot of this kind was associated with other features besides which recalled the type of the English governess. This fixation of his libido, however, made him, not into a neurotic, but into a [349]
pervert – what we call a foot fetishist.[2] You see, then, that although an excessive, and moreover premature, fixation of the libido is indispensable for the causation of neuroses, the area of its effects extends far beyond the field of the neuroses. This determinant, too, is as little decisive in itself as is the frustration which we have already talked about.

1 [This factor, under various names, was discussed by Freud at least as early as in the first edition of the *Three Essays* (1905*d*), *RSE*, **7**, 214 f. A number of references are given in an Editors' footnote to the paper on a case of paranoia (1915*f*), ibid., **14**, 296 *n.*]

2 [Two or three years earlier Freud had read a paper to the Vienna Psychoanalytical Society on a similar case – possibly, even, the same one. The paper was posthumously published in Volume 4 of the *Minutes* of the Society. It is summarized by Ernest Jones in the second volume of his Freud biography (1955, 342–3). An account of Freud's many discussions of fetishism is given in the Editors' Note to the paper bearing that title (1927*e*), *RSE*, **21**, 135 f.]

Thus the problem of the causation of the neuroses seems to grow more complicated. In fact, psychoanalytic investigation makes us acquainted with a fresh factor, which is not taken into account in our aetiological series and which we can recognize easiest in cases in which what has hitherto been a healthy condition is suddenly disturbed by an onset of neurotic illness. In such people we regularly find indications of a contention between wishful impulses or, as we are in the habit of saying, a psychical conflict. One part of the personality champions certain wishes while another part opposes them and fends them off. Without such a conflict there is no neurosis. There would not seem to be anything peculiar in this. Our mental life is, as you know, perpetually agitated by conflicts which we have to settle. No doubt, therefore, special conditions must be fulfilled if such a conflict is to become pathogenic. We must ask what these conditions are, between what mental powers these pathogenic conflicts are played out, and what the relation is between the conflict and the other causative factors.

I hope to be able to give you adequate replies to these questions, even though the replies may be reduced to schematic dimensions. The conflict is conjured up by frustration, as a result of which the libido, deprived of satisfaction, is driven to look for other objects and paths. The necessary precondition of the conflict is that these other paths and objects arouse displeasure [*Missfallen*] in one part of the personality, so that a veto is imposed which makes the new method of satisfaction impossible
[350] as it stands. From this point the construction of symptoms pursues its course, which we shall follow later.[1] The repudiated libidinal trends nevertheless succeed in getting their way by certain roundabout paths, though not, it is true, without taking the objection into account by submitting to some distortions and mitigations. The roundabout paths are those taken by the construction of symptoms; the symptoms are the fresh or substitute satisfaction which has become necessary owing to the fact of frustration.

The meaning of psychical conflict can be adequately expressed in another way by saying that for an *external* frustration to become pathogenic an *internal* frustration must be added to it. In that case, of course, the external and internal frustration relate to different paths and objects. The external frustration removes one possibility of satisfaction and the internal frustration seeks to exclude *another* possibility, about which the conflict then breaks out. I prefer this way of representing the matter because it has a secret content. For it hints at the

1 [In the following lecture.]

probability that the internal impediments arose from real external obstacles during the prehistoric periods of human development.[1]

But what are the powers from which the objection to the libidinal trend arises? What is the other party to the pathogenic conflict? These powers, to put it quite generally, are the nonsexual drive forces [*Triebkräfte*]. We class them together as the 'ego drives'.[2] The psychoanalysis of the transference neuroses gives us no easy access to a further dissecting of them; at most we come to know them to some extent by the resistances which oppose analysis. The pathogenic conflict is thus one between the ego drives and the sexual drives. In a whole number of cases, it looks as though there might also be a conflict between different purely sexual trends. But in essence that is the same thing; for, of the two sexual trends that are in conflict, one is always, as we might say, 'ego-syntonic',[3] while the other provokes the ego's defence. It therefore still remains a conflict between the ego and sexuality.

Over and over again, gentlemen, when psychoanalysis has claimed [351] that some mental event is the product of the sexual drives, it has been angrily pointed out to it by way of defence that human beings do not consist only of sexuality, that there are drives and interests in mental life other than sexual ones, that it ought not to derive 'everything' from sexuality, and so on. Well, it is most gratifying for once in a way to find ourselves in agreement with our opponents. Psychoanalysis has never forgotten that there are drive forces as well which are not sexual. It was based on a sharp distinction between the sexual drives and the ego drives, and, in spite of all objections, it has maintained not that the neuroses are derived from sexuality but that their origin is due to a conflict between the ego and sexuality. Nor has it any conceivable reason for disputing the existence or significance of the ego drives while it pursues the part played by the sexual drives in illness and in ordinary life. It has simply been its fate to begin by concerning itself with the sexual drives because the transference neuroses made them the most easily accessible to examination and because it was incumbent on it to study what other people had neglected.

Nor is it a fact that psychoanalysis has paid no attention whatever to the nonsexual part of the personality. It is precisely the distinction between the ego and sexuality which has enabled us to recognize with

1 [Cf. p. 327 below. The whole question of frustration as a cause of neurosis was discussed by Freud in a paper on 'Types of Onset of Neurosis' (1912*c*), *RSE*, **12**, 227 ff.]

2 ['*Ichtriebe*.' An account of Freud's use of this term is given in the Editors' Note to 'Drives and their Vicissitudes' (1915*c*), ibid., **14**, 101 f.]

3 ['*Ichgerecht*', i.e. in consonance with the ego.][T]

special clarity that the ego drives pass through an important process of development – a development which is neither completely independent of the libido nor without a counter-effect upon it. Nevertheless, we are far less well acquainted with the development of the ego than of the libido, since it is only the study of the narcissistic neuroses[1] that promises to give us an insight into the structure of the ego. We already have before us, however, a notable attempt by Ferenczi [1913*c*] to make a theoretical construction of the stages of development of the ego, and there are at least two points at which we have a solid basis for judging that development. It is not our belief that a person's libidinal interests are from the first in opposition to his self-preservative interests; on the contrary, the ego endeavours at every stage to remain in harmony with its sexual organization as it is at the time and to fit itself into it. The
[352] succession of the different phases of libidinal development probably follows a prescribed programme. But the possibility cannot be rejected that this course of events can be influenced by the ego, and we may expect equally to find a certain parallelism, a certain correspondence, between the developmental phases of the ego and the libido; indeed a disturbance of that correspondence might provide a pathogenic factor. We are now faced with the important consideration of how the ego behaves if its libido leaves a strong fixation behind at some point in its (the libido's) development. The ego may accept this and consequently become to that extent perverse or, what is the same thing, infantile. It may, however, adopt a non-compliant attitude to the libido's settling down in this position, in which case the ego experiences a *repression* where the libido has experienced a *fixation*.

Thus we discover that the third factor in the aetiology of the neuroses, the *tendency to conflict*, is as much dependent on the development of the ego as on that of the libido. Our insight into the causation of the neuroses is thus made more complete. First there is the most general precondition – frustration; next, fixation of the libido which forces it into particular directions; and thirdly, the tendency to conflict, arising from the development of the ego, which rejects these libidinal impulses. The situation, then, is not so very confused and hard to penetrate as it probably seemed to you during the course of my remarks. It is true, however, that we shall find we have not yet finished with it. There is something new to be added and something already familiar to be further examined.

1 [Discussed in Lecture XXVI, p. 364 ff. below.]

Freud with Sándor Ferenczi, 1917

Freud with Sándor Ferenczi, 1917

In a letter to Karl Abraham dated July 3, 1915, Freud wrote: 'I think I regard the [wartime] situation as a repetition of the original one, when I was productive and isolated. All my friends and helpers are now in the army, and have, so to speak, been taken away from me.'

By permission of The Marsh Agency Ltd., on behalf of Sigmund Freud Copyrights.

In order to demonstrate to you the influence which the development of the ego has upon the construction of conflicts and upon the causation of neuroses, I should like to put an example before you – one which, it is true, is a complete invention but which is nowhere divorced from probability. I shall describe it (on the basis of the title of one of Nestroy's farces[1]) as 'In the Basement and on the First Floor'. The caretaker of the house inhabits the basement and its landlord, a wealthy and respectable [353] gentleman, the first floor. Both have children, and we may suppose that the landlord's little daughter is allowed to play, without any supervision, with the proletarian girl. It might very easily happen, then, that the children's games would take on a 'naughty' – that is to say, a sexual – character, that they would play at 'father and mother', that they would watch each other at their most private business and excite each other's genitals. The caretaker's girl, though only five or six years old, would have had an opportunity of observing a good deal of adult sexuality, and she might well play the part of seductress in all this. These experiences, even if they were not continued over a long period, would be enough to set certain sexual impulses to work in the two children; and, after their games together had ceased, these impulses would for several years afterwards find expression in masturbation. So much for their experiences in common; the final outcome in the two children will be very different. The caretaker's daughter will continue her masturbation, perhaps, till her menstrual periods begin and she will then give it up with no difficulty. A few years later she will find a lover and perhaps have a baby. She will take up some occupation or other, possibly become a popular figure on the stage and end up as an aristocrat. Her career is more likely to be less brilliant, but in any case she will go through her life undamaged by the early exercise of her sexuality and free from neurosis. With the landlord's little girl things will be different. At an early stage and while she is still a child she will get an idea that she has done something wrong; after a short time, but perhaps only after a severe struggle, she will give up her masturbatory satisfaction, but she will nevertheless still have some sense of oppression about her. When in her later girlhood she is in a position to learn something of human sexual intercourse, she will turn away from it with unexplained disgust and prefer to remain in ignorance. And now she will probably be subject to a fresh emergence of an irresistible pressure to masturbate of which she will not dare to complain. During the years in which she should exercise a feminine attraction upon some man, a neurosis breaks out in her which

1 [Johann Nestroy (1801–62), famous in Vienna for his comedies and farces. The literal translation of Nestroy's title would be 'On the Ground Floor and on the First Floor': the difference in the social habits of nineteenth-century Vienna and London calls for the alteration.]

cheats her of marriage and her hopes in life. If after this an analysis succeeds in gaining an insight into her neurosis, it will turn out that
[354] the well-brought-up, intelligent and high-minded girl has completely repressed her sexual impulses, but that these, unconscious to her, are still attached to her petty experiences with her childhood friend.

The difference between the lives of these two, in spite of their having had the same experience, rests on the fact that the ego of one of them underwent a development with which the other never met. Sexual activity seemed to the caretaker's daughter just as natural and harmless in later life as it had in childhood. The landlord's daughter came under the influence of education and accepted its demands. From the suggestions offered to it, her ego constructed ideals of feminine purity and abstinence which are incompatible with sexual activity; her intellectual education reduced her interest in the feminine part which she was destined to play. Owing to this higher moral and intellectual development of her ego she came into conflict with the demands of her sexuality.

I will dwell for a little today on yet another point in ego development, partly because I have some remoter aims in view, but also because what follows is precisely calculated to justify the sharp separation between the ego drives and the sexual drives which we favour but which is not self-evident. In forming our judgement of the two courses of development – both of the ego and of the libido – we must lay emphasis on a consideration which has not often hitherto been taken into account. For both of them are at bottom heritages, abbreviated recapitulations of the development which all mankind has passed through from its primaeval days over long periods of time. In the case of the development of the libido, this *phylogenetic* origin is, I venture to think, immediately obvious. Consider how in one class of animals the genital apparatus is brought into the closest relation to the mouth, while in another it cannot be distinguished from the excretory apparatus, and in yet others it is linked to the motor organs – all of which you will find attractively set out in W. Bölsche's valuable book [1911–13]. Among animals one can find, so to speak in petrified form, every species of perversion of the sexual organization. In the case of human beings, however, this phylogenetic point of view is partly veiled by the fact that what is at bottom inherited
[355] is nevertheless freshly acquired in the development of the individual,[1]

1 [This is an echo of a couplet from Goethe's *Faust*, which was a favourite quotation of Freud's. See, for instance, *Totem and Taboo* (1912–13*a*), *RSE*, **13**, 145, and the closing sentences of his *Outline of Psychoanalysis* (1940*a* [1938]), ibid., **23**, 186.]

probably because the same conditions which originally necessitated its acquisition persist and continue to operate upon each individual. I should like to add that originally the operation of these conditions was creative but that it is now evocative. Besides this, there is no doubt that the prescribed course of development can be disturbed and altered in each individual by recent external influences. But we know the power which forced a development of this kind upon humanity and maintains its pressure in the same direction today. It is, once again, frustration by reality, or, if we are to give it its true, grand name, the exigencies of life – Necessity (*Ἀνάγκη* [Ananke]). She has been a strict educator and has made much out of us. The neurotics are among those of her children to whom her strictness has brought evil results; but that is a risk with all education. This appreciation of the necessities of life need not, incidentally, weigh against the importance of 'internal developmental trends', if such can be shown to be present.

Now it is a very noteworthy fact that the sexual drives and the self-preservative drives do not behave in the same way towards real necessity.[1] The self-preservative drives, and everything to do with them, are much easier to educate: they learn early to comply with necessity and to arrange their developments in accordance with the instructions of reality. This is intelligible, since they could not obtain the objects they need in any other way; and without those objects the individual would inevitably perish. The sexual drives are harder to educate, for at first they have no need of an object. Since they are attached like parasites, as it were, to the other bodily functions, and find their satisfaction auto-erotically on the subject's own body, they are to begin with withdrawn from the educative influence of real necessity, and they retain this characteristic of being self-willed and inaccessible to influence (what we describe as being 'unreasonable') in most people in some respect all [356]
through their lives. Moreover, as a rule the educability of a youthful individual is at an end when his sexual needs arise in their full strength. Educators are aware of this and act accordingly; but the findings of psychoanalysis may perhaps also induce them to shift the main impact of education on to the earliest years of childhood, from infancy onwards. The little creature is often completed by the fourth or fifth year of life, and after that merely brings gradually to light what is already within him.

In order to appreciate the full significance of the difference which I have pointed out between the two groups of drives, we shall have to go

1 ['*reale Not*', i.e. the exigencies imposed by reality. For what follows, cf. paragraph (3) of 'Formulations on the Two Principles of Mental Functioning' (1911*b*), *RSE*, **12**, 218 f.]

back a long way and introduce one of those considerations which deserve to be described as *economic* [p. 243 above]. This leads us to one of the most important, but unluckily also one of the most obscure, regions of psychoanalysis. We may ask whether in the operation of our mental apparatus a main purpose can be detected, and we may reply as a first approximation that that purpose is directed to obtaining pleasure. It seems as though our total mental activity is directed towards achieving pleasure and avoiding unpleasure – that it is automatically regulated by the *pleasure principle*.[1] We should of all things like to know, then, what determines the generation of pleasure and unpleasure; but that is just what we are ignorant of. We can only venture to say this much: that pleasure is *in some way* connected with the diminution, reduction or extinction of the amounts of stimulus prevailing in the mental apparatus, and that similarly unpleasure is connected with their increase. An examination of the most intense pleasure which is accessible to human beings, the pleasure of accomplishing the sexual act, leaves little doubt on this point. Since in such processes related to pleasure it is a question of what happens to *quantities* of mental excitation or energy, we call considerations of this kind economic. It will be noticed that we can describe the tasks and achievements of the mental apparatus in another and more general way than by stressing the acquisition of pleasure. We can say that the mental apparatus serves the purpose of mastering and disposing of the amounts of stimulus and sums of excitation that impinge
[357] on it from outside and inside.[2] It is immediately obvious that the sexual drives, from beginning to end of their development, work towards obtaining pleasure; they retain their original function unaltered. The other drives, the ego drives, have the same aim to start with. But under the influence of the instructress Necessity, they soon learn to replace the pleasure principle with a modification of it. For them the task of avoiding unpleasure turns out to be almost as important as that of obtaining pleasure. The ego discovers that it is inevitable for it to renounce immediate satisfaction, to postpone the obtaining of pleasure, to put up with a little unpleasure and to abandon certain sources of pleasure altogether. An ego thus educated has become 'reasonable'; it no longer lets itself be governed by the pleasure principle, but obeys the *reality*

1 [See footnote 2 below.]

2 [This is sometimes referred to as the 'principle of constancy'. It, and the related 'pleasure principle', are discussed in an Editors' Appendix to Freud's first paper on the neuropsychoses of defence (1894*a*), *RSE*, **3**, 59. See also footnote, p. 331 below.]

principle,[1] which also at bottom seeks to obtain pleasure, but pleasure which is assured through taking account of reality, even though it is pleasure postponed and diminished.

The transition from the pleasure principle to the reality principle is one of the most important steps forward in the ego's development. We know already that it is only late and unwillingly that the sexual drives join in this piece of development, and we shall hear later the consequences for human beings of the fact that their sexuality is content with such a loose connection with external reality. And now in conclusion one last remark on this subject. If man's ego has its process of development like the libido, you will not be surprised to hear that there are also 'regressions of the ego', and you will be anxious to know too what part may be played in neurotic illnesses by this return of the ego to earlier phases of its development.[2]

1 [The term appears first in 'Formulations on the Two Principles of Mental Functioning' (1911*b*), *RSE*, **12**, 216, the Editors' Note to which traces the origin of the concept.]

2 [Some account of the development of Freud's views on regression and of his various uses of the term can be found in an Editors' Appendix at the end of Part I of the 'Project' of 1895 in ibid., **1**, 369 ff.]

LECTURE XXIII

THE PATHS TO THE FORMATION OF SYMPTOMS

[358] Ladies and Gentlemen, for laymen the symptoms constitute the essence of a disease and its cure consists in the removal of the symptoms. Physicians attach importance to distinguishing the symptoms from the disease and declare that getting rid of the symptoms does not amount to curing the disease. But the only tangible thing left of the disease after the symptoms have been got rid of is the capacity to form new symptoms. For that reason we will for the moment adopt the layman's position and assume that to unravel the symptoms means the same thing as to understand the disease.

Symptoms – and of course we are dealing now with psychical (or psychogenic) symptoms and psychical illness – are acts detrimental, or at least useless, to the subject's life as a whole, often complained of by him as unwelcome and bringing unpleasure or suffering to him. The main damage they do resides in the mental expenditure which they themselves involve and in the further expenditure that becomes necessary for fighting against them. Where there is an extensive formation of symptoms, these two sorts of expenditure can result in an extraordinary impoverishment of the subject in regard to the mental energy available to him and so in paralysing him for all the important tasks of life. Since this outcome depends mainly on the *quantity* of the energy which is thus absorbed, you will easily see that 'being ill' is in its essence a practical concept. But if you take up a theoretical point of view and disregard this matter of quantity, you may quite well say that we are *all* ill – that is, neurotic – since the preconditions for the formation of symptoms can also be observed in normal people.

We already know that neurotic symptoms are the outcome of a conflict which arises over a new method of satisfying the libido [p. 308 above]. The two forces which have fallen out meet once again in the symptom
[359] and are reconciled, as it were, by the compromise of the symptom that has been constructed. It is for that reason, too, that the symptom is so

resistant: it is supported from both sides. We also know that one of the two partners to the conflict is the unsatisfied libido which has been repulsed by reality and must now seek other paths to its satisfaction. If reality remains relentless even though the libido is ready to take another object in place of the one that has been refused [*versagten*] to it, then it will finally be compelled to take the path of regression and strive to find satisfaction either in one of the organizations which it has already outgrown or from one of the objects which it has earlier abandoned. The libido is lured into the path of regression by the fixation which it has left behind it at these points in its development.

The path to perversion branches off sharply from that to neurosis. If these regressions rouse no objection from the ego, no neurosis will come about either; and the libido will arrive at some real, even though no longer normal, satisfaction. But if the ego, which has under its control not only consciousness but also the approaches to motor innervation and accordingly to the realization of mental desires, does not agree with these regressions, conflict will follow. The libido is, as it were, cut off and must try to escape in some direction where, in accordance with the requirements of the pleasure principle, it can find a discharge [*Abfluss*][T] for its cathexis of energy. It must withdraw from the *abfliessen*
ego. An escape of this kind is offered it by the fixations on the path of its development which it has now entered on regressively – fixations from which the ego had protected itself in the past by repressions. By cathecting these repressed positions as it flows backwards, the libido has withdrawn from the ego and its laws, and has at the same time renounced all the education it has acquired under the ego's influence. It was docile so long as satisfaction beckoned to it; but under the double pressure of external and internal frustration it becomes refractory, and recalls earlier and better times. Such is the libido's fundamentally unchangeable character. The ideas to which it now transfers [*überträgt*] its energy as a cathexis belong to the system of the unconscious and are subject to the processes which are possible there, particularly to condensation and displacement. In this way conditions are established which completely resemble those in dream construction. The dream proper, which has [360]
been completed in the unconscious and is the fulfilment of an unconscious wishful phantasy, is brought up against a portion of (pre)conscious activity which exercises the office of censorship and which, when it has been indemnified, permits the formation of the manifest dream as a compromise. In the same way, what represents[I] the libido in the

1 ['*Vertretung*', i.e. the representative in psychical terms of the libido regarded as something somatic. A fuller discussion of this notion can be found in the Editors' Note to 'Drives and their Vicissitudes' (1915*c*), *RSE*, **14**, 99–100, and especially in the footnote on p. 100.]

unconscious has to reckon with the power of the preconscious ego. The opposition which had been raised against it in the ego pursues it as an 'anticathexis'[1] and compels it to choose a form of expression which can at the same time become an expression of the opposition itself. Thus the symptom emerges as a many-times-distorted derivative of the unconscious libidinal wish fulfilment, an ingeniously chosen piece of ambiguity with two meanings in complete mutual contradiction. In this last respect, however, there is a distinction between the construction of a dream and of a symptom. For in dream formation the preconscious purpose is merely concerned to preserve sleep, to allow nothing that would disturb it to make its way into consciousness; it does not insist upon calling out sharply 'No! on the contrary!' to the unconscious wishful impulse. It can afford to be more tolerant because the situation of someone sleeping is less perilous. The state of sleep in itself bars any outlet into reality.

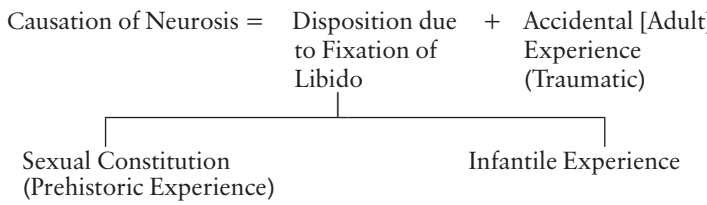
You see, then, that the libido's escape under conditions of conflict is made possible by the presence of fixations. The regressive cathexis of these fixations leads to the circumvention of the repression and to a discharge (or satisfaction) of the libido, subject to the conditions of a compromise being observed. By the roundabout path via the unconscious and the old fixations, the libido finally succeeds in forcing its way through to real satisfaction – though to one which is extremely restricted and scarcely recognizable as such. Let me add two comments to this conclusion. First, I should like you to notice how closely here the libido and the unconscious on one side and the ego, consciousness and reality
[361] on the other are shown to be interlinked, although to begin with they did not belong together at all. And secondly, I must ask you to bear in mind that everything I have said about this and what is still to follow relates only to the formation of symptoms in the neurosis of hysteria.

Where, then, does the libido find the fixations which it requires in order to break through the repressions? In the activities and experiences of infantile sexuality, in the abandoned component trends, in the objects of childhood which have been given up. It is to them, accordingly, that the libido returns. The significance of this period of childhood is twofold: on the one hand, during it the drive trends which the child has inherited with his innate disposition first become manifest, and secondly, others of his drives are for the first time awakened and made active by external

1 [That is, a force acting in a sense contrary to the primary drive energy. See Section IV of 'The Unconscious' (1915*e*), *RSE*, **14**, 160.]

impressions and accidental experiences. There is no doubt, I think, that we are justified in making this twofold division. The manifestation of the innate disposition is indeed not open to any critical doubts, but analytic experience actually compels us to assume that purely chance experiences in childhood are able to leave fixations of the libido behind them. Nor do I see any theoretical difficulty in this. Constitutional dispositions are also undoubtedly after-effects of experiences by ancestors in the past; they too were once acquired. Without such acquisition there would be no heredity. And is it conceivable that acquisition such as this, leading to inheritance, would come to an end precisely with the generation we are considering? The significance of infantile experiences should not be totally neglected, as people like doing, in comparison with the experiences of the subject's ancestors and of his own maturity; on the contrary, they call for particular consideration. They are all the more momentous because they occur in times of incomplete development and are for that very reason liable to have traumatic effects. The studies on developmental mechanics by Roux[1] and others have shown that the prick of a needle into an embryonic germinal layer in the act of cell division results in a severe disturbance of development. The same injury inflicted on a larval or fully grown animal would do no damage.

Thus fixation of the libido in the adult, which we introduced into the [362]
aetiological equation of neurosis as representing the constitutional factor [p. 305 above], now falls, for our purposes, into two further parts: the inherited constitution and the disposition acquired in early childhood. As we all know, a diagram is certain of a sympathetic reception from students. So I will summarize the position diagrammatically:[2]



1 [Wilhelm Roux (1850–1924) was one of the founders of experimental embryology.]

2 [Readers may find this diagram easier to follow in the form of a genealogical tree:

Sexual Constitution (Prehistoric Experience) + Infantile Experience

Disposition due to Fixation of Libido + Accidental [Adult] Experience (Traumatic)

Neurosis.]

The hereditary sexual constitution presents us with a great variety of dispositions, according as one component drive or another, alone or in combination with others, is inherited in particular strength. The sexual constitution forms once again, together with the factor of infantile experience, a 'complemental series' very similar to the one we first came to know between disposition and the accidental experience of the adult [p. 306 above]. In both of them we find the same extreme cases and the same relations between the two factors concerned. And here the question suggests itself of whether the most striking kinds of libidinal regressions – those to earlier stages of the sexual organization – may not be predominantly determined by the hereditary constitutional factor. But it is best to postpone answering this question till we have been able to take a wider range of forms of neurotic illness into account.
